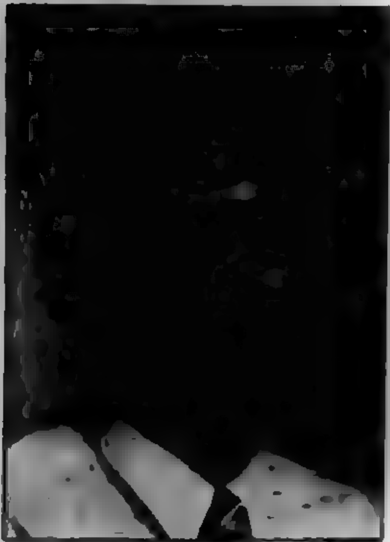
By James Connolly
Special Projects Editor

John Cullinane, where are you?

A suddenly successful, five-year-old minicomputer manufacturer that just went public needs help. The young company's chief executive officer is unsure how to manage 40% annual growth. Headhunters are recruiting his key technical people. His product is a star today but may be forgotten tomorrow, so he must envision new product lines into the 1990s.

The manufacturer and CEO here are fictitious, but if real they would need the guidance and advice of an executive who has survived start-up, boom and stabilization. The company would have a seat on its board of directors for a John Cullinane, chairman of Cullinet Software, Inc., or a similar executive who has practical



Foster

business experience and knows the high-technology marketplace.

"If I am going to add someone, I want someone who has faced the problems that I am going to be facing over the next few years," says Stratus Computer, Inc. President William Foster. "If now and then a person came along with very good experience, then we might take him on. We would look at a chief executive officer who has been through the rapid growth we are going through, which probably means it would be someone from the high-tech field."

Foster, whose Marlboro, Mass., company produces fault-tolerant superminicomputers, was the first of three computer company executives to cite "someone like John Cullinane" as the type of director who could help them manage their firms.

The demand for board members with experience in high-tech management is one trend emerging from computer company boardrooms, where decisions are made that affect not only each company but also the industry, the user-customer, the investor and the communities where the company operates.

A board of directors — an often unrecognized entity — faces decisions as outwardly simple as upgrading an employee benefit package or as complex as firing the CEO or withdrawing investments from South Africa.

Typically, a board meets every other month to perform such tasks as reviewing budgets, receiving briefings on new products and planning corporate expansion. In addition to regularly scheduled meetings, directors sit on specialized committees that focus on such topics as audits or compensation. These committees of three or four perform much of the preliminary work and fact-finding for the board as a whole.

A job as director can approach the status of volunteer work for wealthy executives. Directors typically receive stipends that may total $30,000 to $50,000 per year plus travel expenses. In some less successful companies, the pay consists only of risky stock options.

The composition and powers of boards of directors in the computer industry vary greatly, determined by factors such as company size, philosophy, age and recent business success.

"Today there is a trend toward much more activism and involvement [with their companies] on the part of the boards, a trend to awareness," observes David Francis, a partner in the New York executive recruiting firm Heidrick & Struggles, Inc.

Throughout American industry for at least two decades there was a well-publicized critical view of boards as the heart of the old-boy network, where company presidents filled paneled boardrooms with near-comatose, white-haired men-friends who blindly endorsed the CEO's actions.

Away from old-boy network

"Corporate governance is getting away from the old school ties. The criticism used to be that becoming a director depended upon how well you knew the CEO, not what you had to offer," says Northwestern University Professor of Management James Worthy, a director of Control Data Corp. Worthy is coauthor of *Emerging Issues In Corporate Governance* (1983, Northwestern University Press).

Francis notes that while many corporations are accepting a variety of people, that doesn't necessarily apply at computer companies.

He says, "It is certainly true that doors are opening for new board members such as professionals, women and minorities. But I think this is more a function of potential board liability than of social activity. Companies recognize that they no longer can have boards that just nod and rubber-stamp when the CEO acts. They want to be more representative of the community."

The liabilities Francis cites include not only societal pressures — such as those exerted by the news media, community groups or stockholders — but also financial liabilities if the company is sued.

"But it's the more traditional industries that may be more interested in maintaining a balance on the board, making sure that there are minorities or females or academicians on the board," he adds. "With technical product companies like computer companies, there is more interest in bringing in people who can contribute on the shorter term, technical people who, even if they can't design a supercomputer, have an appreciation of the market and what the technology business is all about. You have to remember that these companies are in a very dynamic market with short product life cycles."

Comparative youth and the dynamics of the market have left computer companies with boards of directors that are far different from those of banks and manufacturers

FUJITSU
BAND PRINTERS
The Numbers are Right.

Now you can find the reliability, the quietness and the form factor you need in the new Fujitsu family of band printers. And with our M3040, M3041, M3042 and M3043 series, you have a choice of speed ranging from 300 LPM to 1200 LPM.

1200 *LPM is a Fast Band Printer.*

6000 *Hours MTBF is a Long Time without Failure.*

Each model delivers consistently crisp, high-quality characters at a speed that only a Fujitsu high-performance band printer can provide. High parts commonality is built right into every Fujitsu machine making service simple and quick. The Fujitsu band printers are surprisingly affordable and each sets a new standard in price/performance. For additional information, contact Fujitsu at 3055 Orchard Drive, San Jose, CA 95134, or give us a call. Our number is (800) 626-4686.

55 *Decibels is a Quiet Machine.*

founded at the turn of the century. Only the boards of the most established computer companies, such as IBM, resemble the directorates of more traditional industries.

A company may originally be little more than a founding engineer working on a handshake with seed money provided by a couple of friends, notes George McQuilken, founder of Spartacus Computers, Inc. and now CEO of Language Technologies, Inc., a Salem, Mass., software service firm. "For a start-up company, the time to get serious about your board of directors is when you get your first outside investment," he says.

McQuilken says Spartacus, which he left in 1984, was lucky in that no strings were attached to its first infusion of cash. "[Nixdorf Computer Corp.] was our first major source of capital. . . . What was interesting was that Nixdorf's role was to ask for no role in the company."

Money means seats

Unlike Nixdorf, subsequent investors in Spartacus wanted seats on the board of directors. When six venture capital firms posted a $3 million investment, they demanded three seats on the seven-member board.

McQuilken, another employee and another founder filled three others, and the remaining seat was filled by consensus among the first six.

McQuilken cautions that a start-up should ensure that it has an experienced outside computer industry executive on its board and that its agreements with venture capitalists specify who will represent the investors on the board. Such agreements can prevent the investors' seats from being filled by junior executives of the venture capital firms — executives who don't command the investment community respect accorded senior executives.

Stratus' Foster says, "Most of these companies get started with the help of venture capitalists, who usually want a place on the board. When the companies were private, they generally owned a certain percentage of the stock. After the companies went public, the venture capitalists could choose to stay on if the company continued to go well."

The investor viewpoint

Stratus director Paul Ferri, general partner of Matrix Partners of Boston and one of three venture capitalists on the Stratus board, says that the challenge for a director with a company like Stratus is in "maintaining the entrepreneurial spirit."

He notes, "Our role is an advisory one. It's one where we bring ideas to a company. We're not involved in the day-to-day operations, so we can be more detached in developing ideas."

While the boards of young companies are dominated by venture capitalists, those investors don't always leave four or five years down the road.

At Digital Equipment Corp., four members of the seven-person board — a small directorate for a 28-year-old, $5.5 billion company — have links to the company's venture capitalization in the years before DEC went public in 1966.

Employee input

DEC, like Stratus, is also exceptional in that only one company employee, President and CEO Kenneth Olsen, sits on the board. "He feels we can contribute to board discussions without being voting members. It's one less status symbol. Being a member of the board can turn into that," says Winston Hindle Jr., DEC's vice-president for corporate affairs.

Foster says that at Stratus, he excludes other employees from the board to prevent them from participating in decisions that directly affect themselves.

Of the 127 directors on the boards of 10 leading computer companies, only 38 are current or former company employees. Almost as many are executives with other corporations.

One director who differs with the idea of excluding employees is CDC's Worthy. He says, "I think it is important; in the computer industry in particular, it is very useful to have a strong representation of inside directors because of the technology involved.

"I assure you, as a management person myself, that it is very comforting to have an inside director who knows the technology. It's important that they work with you as a peer, not as

Some people just ask for trouble.

Isn't it amazing just how many people go around asking for trouble?

Why, we're willing to bet there are people in your DP department this very minute flirting with disaster.

They're running the risk of a misplaced DD override, an invalid concatenation, or some other equally obscure JCL error bringing the whole kit and caboodle to a screeching halt.

When all they have to do to keep things running smoothly is use our JCLCHECK™ program.

JCLCHECK software catches all JCL errors and provides complete, on-line JCL validation and concise error diagnostics. Plus complete documentation on a job stream or entire production system suitable for insertion in the run book. And it can operate under TSO, TONE, ROSCOE or CMS.

No more errors — no more troubles. It's that simple. And successful.

Over 400 DP departments now use JCLCHECK software to correct the errors of their ways, and save money at the same time.

To put it in another perspective, we'll send a sales representative out to analyze *your* operation and provide a written statement on exactly how much time and money you're spending on JCL errors. And how much you could be saving with the JCLCHECK package.

Still, some people are destined to find these things out the hard way.

To that we can only add, better them than you.

Yes, I want to stop living dangerously.
☐ Send me details on the JCLCHECK program.
☐ Have a representative call me.

someone who comes in to make a report and then goes out. They should sit with you and share the responsibility."

Just as directors and executives differ on who should sit on boards, the selection process differs from one company to the next, although the formal process usually has the CEO offering stockholders a slate of candidates for election at the annual meeting.

At some firms, directors are chosen because the CEO has worked with them before. In others, directors recommend directors, as when Ferri suggested that Foster take on Alexander d'Arbeloff, founder of Boston-based test equipment manufacturer Teradyne, Inc. Still others use executive search firms such as Francis' to find directors.

While lawmakers periodically file bills that would set guidelines for governing boards of directors, the primary restrictions remain a Securities and Exchange Commission ban on directors sitting on competitors' boards and a New York Stock Exchange requirement that firms listed on the exchange maintain an audit committee of outside directors.

Worthy notes that interlocking boards — the practice of executives sitting on each others' boards — may have once been popular but is now "very unimportant" — neither a positive nor a negative influence.

However, it is still common to see directors of a single company coming from the same colleges, belonging to the same clubs and working for the same social organizations. Some

INTELLIGENCE

The #1 3270 alternative for people who need an intelligent workstation to be more than a PC.

When you need to combine the resources of your host with the flexible processing of your workstation, there's a more intelligent choice than a PC.

The Telex 1186 is specifically designed for 3270 networks. And while it's PC compatible, the 1186 runs most programs two to three times faster than the IBM PC. Plus, Telex's host-based file transfer programs support high-speed data transfers to and from the mainframe. In fact, the 1186 performs more like an AT than a PC.

The Telex 1186 is more than a PC when it comes to options, too. Because Telex offers unique features like a 3270-style keyboard, a 3278 coax port, a 3276 port and a 3270 PC emulation mode. Color graphics capabilities, serial and parallel ports and date/time functions are all standard features on the 1186.

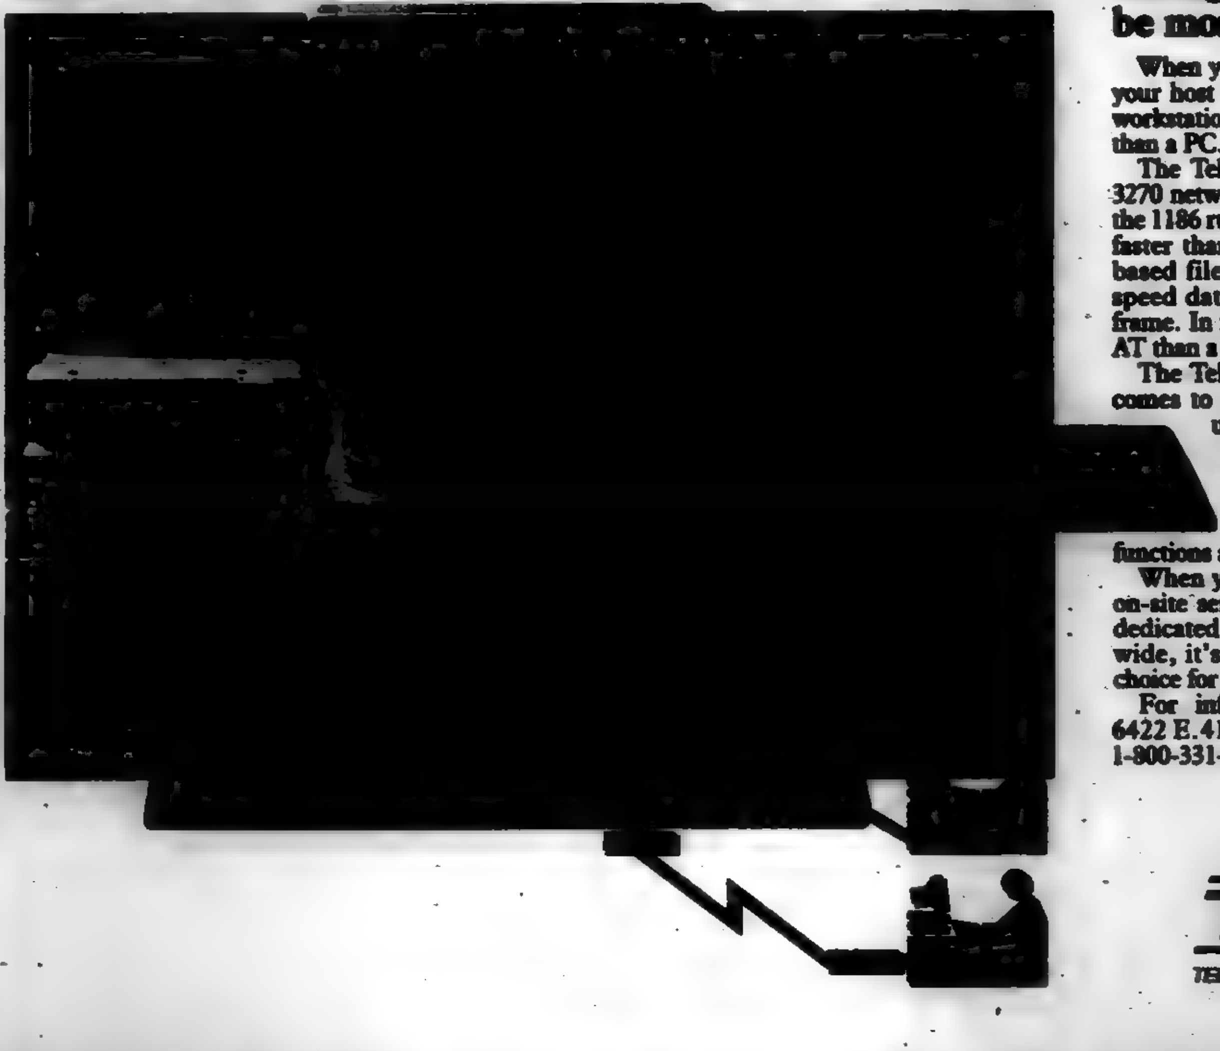
When you put all of this together with our on-site service option and over 2,000 Telex-dedicated service and support people worldwide, it's no wonder Telex has become the choice for 3270 Intelligent Workstations.

For information, contact John Hawkins, 6422 E. 41st Street, Tulsa, Oklahoma 74135/ 1-800-331-2623.

The #1
3270 Alternative

TELEX

TELEX COMPUTER PRODUCTS, INC.



overlap is natural because of regional considerations. For example, California's Hewlett-Packard Co. board is dominated by alumni of a local college — Stanford University — and Boston-area boards are packed with Harvard University and MIT graduates.

Celebrity directors

Heidrick & Struggles' Francis notes that former government officials are added to boards in part for their public relations value and in part because of their familiarity with the government machinery. Two of the more sought-after personalities are former President Gerald Ford and former Secretary of State Henry Kissinger, he says.

Celebrities appear occasionally on the boards of high-tech firms. Cullinane added former hockey star Bobby Orr to the Cullinet board after meeting him during a golf tournament. Within months of U.S. Sen. Paul Tsongas' (D-Mass.) announcement of his retirement last year, he was named a director of Wang Laboratories, Inc.

At Sperry Corp., five out of 10 directors are executives with other corporations, with little apparent emphasis on government experience. But at IBM, six out of 21 directors listed in the 1984 annual report were former Cabinet-level officials.

CDC's 18 directors come from eight major backgrounds — CDC, other corporations, finance, law, education/research, medicine, consulting and government.

Board power

While most executives and directors won't publicly describe their boards as either weak or strong, boards should remain as advisory committees, Worthy observes.

"Typically, the chief executive officer pretty well calls the shots," he says. "He has a large influence on the composition of the board, and the way he relates to the board pretty much defines how the board is going to act. He should be the one who pretty much calls the shots because he is the one who is there every day and is most familiar with the company. But one thing happening in general with respect to power is a shift in the center of gravity to move some of that power toward the board but not to where the power actually rests with the board."

Worthy notes that areas where board power is increasing are in the selection of the chief executive's successor and in strategic planning, particularly in trying to balance long-term and short-term goals. He says that CEOs, who tend to reach the top a few years before retirement and feel pressured to leave their mark quickly, and outside directors lacking in technical skills may be too wary of innovative, risky, long-term ventures. He suggests both may sacrifice innovation in view of the stockholders' demand for near-term return on investment.

Part of planning long-term strategy is the director's assistance in choosing new directors — which Worthy says has happened more frequently in the past five years — and in choosing a successor to the CEO.

Burroughs Corp. director James Fletcher was involved in the 1979 hiring of former U.S. Treasury Secretary and Bendix Corp. executive W. Michael Blumenthal as Burroughs CEO. Fletcher notes, "The toughest decisions as a director are always who the officers of the company are going to be. In the case of Burroughs, we felt that we had to go outside the company to get a CEO.

> ❞
>
> *It is still common to see directors of a single company coming from the same colleges, belonging to the same clubs and working for the same social organizations.*

"Another tough question comes when the CEO can't do the job, which is something we haven't faced at Burroughs. Every time you hire a CEO, you raise the question of what direction the company is going in. Your responsibility is clear. You want to make sure the shareholders are getting their money's worth. That's the mandate. You do have to consider questions like social good, but that's secondary."

Even when fully staffed, the board can be expected to change. McQuilken advises that a board should evolve with the company as the firm moves from its entrepreneurial or start-up stage through its initial sales stage and into maturity.

Hindle says DEC is at that more mature stage, and its board is expanding to handle new challenges. "We feel that as we get larger we have more need for advice and counsel from people who have large-company experience," he says. Olsen took a step in that direction five years ago by adding Ford Motor Co. CEO Philip Caldwell.

However, finding an executive to take a board seat can be the challenge, McQuilken adds. He says that one good thing about venture capitalists is that they regularly attend their board meetings. Outside directors, particularly busy executives, may not have the time when dealing with their own companies, social organizations and other directorships. McQuilken, another who mentioned the name of Cullinane, says, "It's like town government. If you have something that has to be done, you have to ask a busy man."

With CCA's Information Center, what do you have to teach end users? Nothing.

With our Intelligent Information Center, your business executives can access and immediately use the mainframe database without learning a thing about computers.

Very, very productively.

Here's why. The IIC is a language free, decision support query and report writing system, that's menu driven and syntax free. In fact, it's just about keyboard free.

And, it is already proven in industry use. Proven to be a very powerful, very flexible link between personal and mainframe computers.

We call it intelligent because there's no learning involved for the end user. No matter what each has been using – including LOTUS™ 1-2-3™ or VisiCalc® – data can be downloaded from the DBMS to the spreadsheet that each is familiar with.

Or, they can upload data from micro to mainframe.

It provides the tools that let the MIS integrate all the end user problem solving and reporting uses, back into a unified pool of information. A truly intelligent solution.

The IIC is offered as a standalone system, or as a subsystem of CCA's powerful MODEL 204 DBMS.

LOTUS and 1-2-3 are trademarks of Lotus Development Corporation. VisiCalc is a registered trademark of VisiCorp.

Send the coupon to learn more about the Intelligent Information Center. Or, call 1-800-258-4100.

Send more IIC information.

Join command bolsters CPF

The recently announced Release 7 of the CPF operating system for IBM's System/38 [CW, June 24] is notable for the addition of the Join operator command to the System/38's relational data base management system.

The Join command is one of three core requirements of a relational DBMS as outlined by Edgar F. Codd, an IBM Fellow of the San Jose Research Laboratory in California, who originated the relational model. When accepting the Association for Computing Machinery's Turing Award in 1981, Codd said relational DBMS technology provides a practical way for DP departments to attack two major problems.

One problem is the need to put corporate data stored in computers directly into the hands of end users. The other is to increase the productivity of DP professionals in the development of application programs. Only by achieving these goals will DP departments meet the rapidly growing demand for new applications, Codd stated.

Robert N. Goldman, president of Cullinet Software, Inc., the leading independent DBMS vendor, contends that while a true relational system requires a Join command, not all DBMS that claim to be relational have it. "Everyone wants to buy relational, so every DBMS has become relational," Goldman observed.

The Join command allows fields from separate records to be linked together as if they were one. Many IBM programmers worked long hours to bring this function to Release 7, according to David Anderson, IBM's System/38 product manager. For performance rea-

Single vendor: Boon or bane?

Several months ago, an article appeared in this column extolling the virtues of a one-vendor software solution [CW, May 20].

Any software vendor offering more than a single product will naturally emphasize and extoll the virtues of installing all of its products. The justifications for doing this include the following: only one vendor will have to be dealt with when maintenance problems arise; and, of course, lease or rental agreements can be made more attractive when multiple products are installed.

The trend toward the installation of multiple, related offerings from one software vendor can only be expected to increase and intensify because of the current merger and acquisition fever in the software industry and because of the potential advantages offered by integrated packages.

What does this trend toward a one-vendor solution to the software needs of the data center mean for the DP manager or MIS director charged with acquiring and implementing such software? On the one hand, it would seem to make the selection, installation and use of software much simpler — the DP manager simply selects a vendor and then purchases whatever packages that vendor offers.

But the availability of such a "total solution" raises significant questions. The supposed increase in the ability of packages from the same vendor to work

IBM Profs users speak out

By John Desmond
CW Staff

BERKSHIRE, England — The major strength of IBM's Professional Office System (Profs) is its electronic mail features, and its primary weakness is that it is difficult to use.

That was the conclusion of a recent survey of 45 U.S. Profs users conducted by Xephon Technology Transfer, Ltd. Among the survey's other major findings were the following:

- The change to Profs most sought after by end users is improved word processing capabilities. Profs' document management facilities were given a low rating. Users said the DCF and the GML were overly complex. Several respondents commented that a word processing product based on IBM's Displaywriter would be a better solution.
- Users of the VM operating system were attracted to Profs because it works with the IBM 3270 terminals they already have in place, which makes unnecessary costly specialized office automation equipment for sending electronic mail.
- The system's electronic mail capabilities were given the highest marks by users, followed by the diary/calendar and conference scheduling tools and the proofreading aids, which include a spelling checker and a stylistic aid.
- Profs users ranged from managers to secretaries, and most were regular users as opposed to occasional users. By department, most Profs users were members of the DP staff. "VM has always been popular in DP circles and Profs appears to be following in this tradition," the survey stated.

In addition to enhancements to word processing, users sought improvements to the system's document storage and retrieval tools, specifically the ability to perform full text searches. Dead management was reported to be an operating problem

If Your Job Accounting Requirements Are Unique...

BDBF gives you the flexibility to be creative

Just as artists have different styles, billing requirements vary from installation to installation and from user to user. The Billing Database Facility (BDBF) is designed with the flexibility to meet these varying job accounting and chargeback requirements in **MVS** and **MVS/XA** environments. It is written in SAS®, providing the flexibility to tailor the standard reports and the freedom to create reports and graphs to meet special management requests.

SOFTSCOPE

Notes from the software industry front

Digital Equipment Corp. has joined with **Coefficient Systems Corp.** to distribute New York-based Coefficient's Vterm II communications software through DEC's Digital Distributed Software program. Vterm II enables users of the IBM Personal Computer, Personal Computer XT and AT to communicate with DEC VAX and PDP minis.

■

Digital Equipment Corp. and **Signal Technology, Inc.** (STI) of Goleta, Calif., announced that DEC will co-sell STI's Smartstar applications development and data management system for the DEC VAX. Smartstar interfaces directly with DEC's Relational Database System and will be available through DEC's Digital Classified Software program.

■

Palo Alto, Calif.-based **Hewlett-Packard Co.** and **Relational Technology, Inc.** (RTI) of Alameda, Calif., inked an agreement to provide RTI's Ingres relational data base management system for HP's Series 9000/500. In cooperation with HP, RTI will directly market Ingres for the processors.

■

Apollo Computer, Inc. and **Lucid, Inc.** announced that Chelmsford, Mass.-based Apollo will sell and support Palo Alto, Calif.-based Lucid's implementation of Common Lisp. The agreement calls for Lucid to develop an implementation of Common Lisp for Apollo's Aegis and Domain/IX operating systems.

■

Apollo Computer, Inc. also unveiled details of its licensing agreement with **Verdix Corp.**, McLean, Va., which calls for Verdix to supply versions of its Verdix Ada Development System (Vads) for Apollo's family of Domain workstations. Apollo will market and support the systems. Verdix also penned a licensing agreement with **Harris Corp.'s Computer Systems Division** that will enable Harris to develop a version of Vads for its superminis and workstations.

■

TSR, Inc. of Hauppauge, N.Y., announced that it has completed the Honeywell Corp.-to-IBM conversion of **American Express Bank Ltd.**'s international banking software system. The software, which previously ran only on Honeywell processors, automates a range of functions for international banks and similar institutions.

Users group guides changes to IBM's CICS

CHICAGO — Guide, one of the largest IBM users groups, recently responded to IBM's introduction of an enhanced version of CICS — which was upgraded, in large measure, based on Guide's recommendations — by saying the product release "demonstrates Guide's positive influence on CICS development and direction."

Guide also said the impact of CICS Version 1, Release 7 [CW Aug. 12] will aid in the continuing development of its CICS Group.

The major revisions to CICS that stemmed from requirements from Guide and Share, another IBM users group, included enhancements to the Resource Definition Online facility to allow for on-line definition of terminals; improvements in the areas of installation and maintenance of Vtam terminals; security enhancements; added command-level programming facilities; and restart and installation enhancements.

SPSS analysis software out

CHICAGO — SPSS, Inc. has announced data analysis and formatting software for IBM CMS, OS, MVS and Digital Equipment Corp. VMS installations.

SPSS Tables reportedly produces camera-ready tables with data analyzed by the vendor's SPSS-X, a statistical analysis and reporting package. SPSS Tables can handle alphanumeric data with unlimited unique values, as well as multiple response and multiple dichotomy data.

The product computes frequency counts, means, percentiles and other statistics and can produce stub and banner tables. Users can control titling, labeling, footnoting, spacing and data display, or they can use the system defaults to produce tabular reports.

Integration with SPSS-X allows users to create and modify variables; select, sample and weight cases; process subgroups; and read complex files, including column binary data. SPSS Tables users have access to 40 different statistical and plotting procedures in SPSS-X.

SPSS Tables is initially available for SPSS-X 2.1 users and additional conversions are under way. The product costs $2,000 for an annual license, with a $1,000 renewal charge.

SPSS is located at 444 N. Michigan Ave., Chicago, Ill. 60611.

Ethernet
TCP/IP for VAX/VMS
Off the Shelf!

Complete package
for $8,795

Excelan offers a complete high-performance communications package including hardware, software, transceiver and all cables. Everything you need to perform high speed file transfers or do remote logins via Ethernet from a VAX running VMS or UNIX System V to UNIX 4.2 BSD machines and vice versa. Software includes TCP/IP protocols, and standard FTP (file transfer) and Telnet (virtual terminal) applications.

The entire VAX/VMS package is only $8,795, including the EXOS 204 Ethernet controller (quad-size Unibus board), EXOS 8040 TCP/IP software, EXOS 1100 transceiver and cables. And the entire UNIX System V package is only $7,295.

Excelan also offers similar packages for DEC PDPs, UNIX supermicros, and the IBM PC, XT and AT.

Get an IBM computer by Sept. 30 and save up to $16,500 on software.

There are a lot of good reasons to buy an IBM System/36 (5360 and 5362), IBM System/38 or the IBM 4361. Now there's a good reason to buy one quickly.

If you install any of these IBM computers or upgrade an IBM 4321 or IBM 4331 to a 4361 before September 30th, you can order up to $50,000 of selected IBM software at a 33% discount off the suggested retail licensed price. So you can save as much as $16,500.

Whatever your business, an IBM Computer System can help you do what you do, better. To have an IBM Marketing Representative contact you about this offer, call IBM Direct at 1 800 IBM-2468, ext. 90, LU.

IBM

Tandem announces C, Pascal versions for Nonstop systems

CUPERTINO, Calif. — Tandem Computers, Inc. has unveiled versions of the C and Pascal programming languages for applications development on its Nonstop systems. The vendor also announced a version of Cobol 85, a proposed Ansi standard programming language that provides productivity extensions, and the Tandem Advanced Command Language, a command interpreter for Nonstop systems.

Tandem C, based on the Lattice, Inc. C compiler, has extensions that provide access to Tandem facilities and is compatible with the C compiler used for programming the Tandem Dynamite workstation and the IBM Personal Computer.

Tandem Pascal is based on the Ansi/IEEE 770 X3.97-1983 standard and Level 0 of the ISO 7185 standard. Tandem Cobol 85 supports all required modules specified in the Draft Proposed Revised Ansi Programming Language Cobol (X3.23-198X).

Both C and Pascal cost an initial $1,000, plus a monthly license fee of $225 for Nonstop II and Nonstop TXP systems, and $500 plus $115 per month for Nonstop EXT systems. Prices include runtime libraries. C will be available in the fourth quarter of 1985 and Pascal in the first quarter of 1986.

Cobol 85 costs $1,000 per Nonstop II or TXP system, with a monthly license fee of $300. The EXT costs $500 with a $150 monthly fee. The runtime library costs $500 per system for the Nonstop II and TXP and $250 for the EXT, with a monthly fee of $100 per system. First shipments of Cobol 85 will take place in the first quarter of 1986.

More information is available from Tandem at 19333 Vallco Pkwy., Cupertino, Calif. 95014.

SINGLE

from page 45

together is a feature that must be considered in addressing a single-vendor solution. Will the security system from a particular vendor, for example, work better and offer more ease of use if it is combined with the vendor's Dbms management system, as opposed to a similar package from another vendor?

That question can only be answered through a detailed requirements definition and analysis by the user. One would certainly expect that if a vendor's products have been designed to work together — and, it must be remembered, not all have — then there would be increased efficiency and functionality from using them together. But that is not always the case.

Service, support sensitive issue

The issue of improved service and support is a somewhat sensitive one for most software vendors. Will buying five or six products automatically entitle a user to additional consideration when a problem is discovered? Most reputable vendors claim their support is outstanding even if a user has only one product.

The capable data center manager will keep in mind that it becomes much easier to assign responsibility for a problem between two products if both are from the same vendor.

If your shop is a major customer of the vendor, it seems reasonable to assume that a higher degree of attention will be brought to bear on a significant problem. A problem is also easier to locate and fix if the same service personnel can look at both products involved.

But, it must also be remembered that software maintenance people at vendor support locations are often willing and equipped to locate problems that turn out to be with another vendor's product. The question of additional service leverage is a subjective one and is open to change as the individuals involved change.

Additional disadvantages

In addition to the cautions noted above, there are some other potential disadvantages involved in the one-vendor approach. The most serious may be that such an approach often limits a user's choices to some less-than-optimal software packages.

If you have decided on a one-vendor solution, you may be forced to settle for an inferior product for any one particular function. The overall benefits of a single vendor may outweigh this disadvantage, but it is one that must be considered carefully.

A related danger inherent in tying your data center software fortunes to a single software vendor is that you have limited your data center to just one source for new products and enhancements and for support for new hardware and operating system introductions.

Of course, you can always obtain a new package from another vendor, but then the advantages of the one-vendor approach no longer operate. The vendor selected must have a proven research and development track record and a stable financial history.

It is not the aim of this column to convince anyone that the one-vendor solution is or is not a proper strategy. With the trend toward development of integrated product portfolios will come increasing pressure on the data center manager to select a single vendor.

Instead, this column is intended to shed light on some of the trade-offs involved in the one-vendor approach. Exploration of the issues discussed here will have to go hand-in-hand with the detailed requirements and specifications analysis involved in any software purchase.

The selection of software packages can be a more critical issue since software is much more difficult to change than, for example, terminals or disk drives.

The choice of a one-vendor solution for software will make the life of a data center manager much simpler because it greatly reduces the work involved in selecting software. However, it may not be the best solution for the data center or for the organization.

Certainly, the management challenge of running a multivendor software environment is great, but there are many managers who possess the skills and business acumen necessary to accomplish the task.

The more se
you are about dial mod
the better we look.

Talk to most so called "networking companies" about point-to-point dial networking and you'll probably get a big song and dance, but very few products.

Codex, on the other hand, offers a complete repertoire of dial modem solutions. To meet any need.

We offer a full line of 2400 bps modems, proven in benchmark studies to be more accurate, more reliable over degraded lines than any other modems on the market.

We offer Bell-compatible and international modems.

We even offer modems that have a sophisticated error-correcting feature.

The fact is, we offer the most complete dial modem line in the industry.

Which means one thing: when you talk to a Codex applications expert you're talking to a person who can be totally objective in recommending products for your environment.

Maybe that's why in a recent industry wide survey we were chosen as the preferred modem supplier.*

Maybe that's why you should be talking to us, too.

LOSE FAT.

THE LEADER IN ON-LINE TRANSACTION PROCESSING INTRODUCES THE FIRST NONFAT DISC.

It's the first disc drive product specially designed for high-volume transaction processing. It's designed for fast response time, too, with eight simultaneous accesses in one cabinet. And it conserves your most expensive real estate—the computer room.

SMALL FOOTPRINT. BIG SAVINGS.

In one of our typical database applications, five Tandem V8s provide 700 accesses per second in only 50 sq. ft. of computer room space. For the same job, the competition would have required 250 sq. ft., five times as much, plus an extra $146,000 in hardware.

The reason for the difference—disc fat.

To handle high volume, a database must be split up over several discs for simultaneous access. So with large, conventional disc drives, only a small portion of each disc gets used.

Not with the Tandem V8. We put data on small high density discs. The entire disc gets used. So, no disc fat.

EASY TO SERVICE.

With the Tandem V8, maintenance is easy too. Each disc drive can be removed and replaced in a few minutes. And the entire unit can stay on line even while it's being serviced.

THE NEW TANDEM V8.
For fast response time and high-volume transaction processing.

GROW MUSCLE.

THE LEADER IN ON-LINE TRANSACTION PROCESSING BEEFS UP YOUR BRANCH OFFICE.

Tandem extends its fault-tolerant line with a new low-cost system that's totally compatible with the more powerful NonStop TXP™ and the NonStop II.™ Its price and size let you put power where you need it—even a branch office or department copy room.

The NonStop EXT™ comes with enough muscle to support up to 100 terminals. So it takes the work load off the main host and serves as your local host. It also shares information in your corporate network.

The EXT is self-contained in one cabinet. Just wheel it in and plug it in. No additional air conditioning is needed.

It comes with enough expansion slots to double its processing power and quadruple its memory. You can also link two EXTs together if you need them. You can even team it up with the nonfat Tandem V8.

LET'S CHEW THE FAT.

Tandem systems are already at work for FORTUNE 500 companies in banking, telecommunications, manufacturing, transportation, retailing and energy, as well as several branches of the United States Government.

To find out what we can do for you, call (800) 482-6336. Or write for our annual report. Corporate Headquarters: 19191 Vallco Parkway, Dept. 762, Cupertino, California 95014.

THE NEW TANDEM NONSTOP EXT™
The low-cost extension to your network.

Uniras announces data link

BURLINGTON, Mass. — Uniras, Inc. has announced the Unigraph Data Link, an option for its Unigraph business graphics software.

Unigraph Data Link consists of a full screen data editor and a user-definable file reading facility that allows users to read data sets and user labels selectively in a variety of formats, according to Uniras.

The product also includes data transformation capabilities that include arithmetic data set operations to minimize external modifications of data, the vendor said.

The Unigraph Data Link runs on IBM mainframes under MVS/TSO and VM/CMS and on Digital Equipment Corp.'s VAX minicomputers under VMS and Prime Computer, Inc. and Data General Corp. systems.

It is priced from $1,500 on the IBM Personal Computer AT to $7,000 for IBM mainframes.

Uniras also announced the Unipict Interpreter, an enhancement to Version 5 of its Raspak graphics and device handling software for IBM mainframes, DEC minicomputers and Cray Research, Inc. supercomputers. The Unipict Interpreter formats graphics files for transfer between computer systems for output or further processing, the vendor said.

Raspak Version 5 is priced from $12,000 to $24,000, depending on configuration.

An interactive system for schematic specification and simulation was also introduced. The ICPC-Simulator is designed for multiuser systems in a VAX or IBM environment.

Symbolic display

Simulation results can be processed graphically or by a symbolic display of numeric results of selected connection bundles.

Graphical post processing allows users to control how results are displayed, the vendor said.

The ICPC-Simulator is priced from $5,000 on the IBM Personal Computer AT to $28,000 on the IBM 3030, 3080 and 3090 series.

More information is available from Uniras located at Suite 212, 50 Mall Road, Burlington, Mass. 01803.

SYSTEMS SOFTWARE

■ BMC Software has introduced Local Copy Plus, systems software that allows users of IBM printers and 3270 terminals to generate and send exact screen images to other users in IBM's IMS/DC network.

Local Copy Plus frees terminals immediately after initiation of print requests. Print traffic is routed through an IMS Message Queue and enables a single printer to be used for both the screen copy function and IMS-generated application output, including special forms. If a printer fails, unprinted screen messages can be stored in the IMS Message Queue until the printer is back on-line.

Local Copy Plus costs $12,950.

BMC Software, P.O. Box 2002, Sugar Land, Texas 77478.

The BOCs' Choice for Data Communications

Now, more and more Bell Operating Companies are making Databit their dependable source for today's advanced packet-switching networks. A member of the Siemens family, Databit is part of one of the world's largest electronics companies. Teamed with Siemens, Databit offers the BOCs solutions to the complexities of today's data-communications networks.

Siemens-Databit packet networks provide the BOCs with complete network management, cost-effective network topology, high throughput, and multiple-protocol support; plus the ability to grow and meet their customers' changing needs.

Our packet-switching systems are field-proven, with X.75 connections to over 20 data networks worldwide. And in the U.S., more BOCs have chosen Siemens-Databit packet networks than all our major competitors combined.

Packet Switches, Advanced Network Processors, Data-Voice Multiplexers, and Modems
The network backbone is the EDX-P, a powerful and flexible X.25/X.75 switch for public or internal data networks. With its state-of-the-art Network Nodes and Network Management Center, the EDX-P offers redundant, hot-standby operation; multiple call and data priorities; and billing (including AMA billing).

The access layer of the EDX-P network, our Advanced Network Processor (ANP), supplies the power, versatility, and cost-effectiveness needed for X.25/X.75 packet-network access. The modular and expandible ANP handles up to 128 subscribers, and it supports multiple protocols (including asynchronous, 3270 DSP, X.25, and X.75) and multiple high-speed trunks up to 56/64 kbit/s.

With our modems and data-voice multiplexers, and the extension of our network-control system to all layers of the network, we have become a dependable source for packet networks for the BOCs.

Comprehensive services
In addition to supplying complete packet networks, we support our customers with a comprehensive array of services, such as network planning, commissioning, and installation, software and hardware engineering, and totally U.S.-based manufacturing facilities.

Join the growing list of BOCs and other telecommunications companies—including New York Telephone, Southern New England Telephone, Wisconsin Bell, Indiana Bell, New England Telephone, NETECH Communications (of U.S. West), and many more—who look to Databit for advanced packet-network systems.

Databit A Siemens Company

The office of the future arrives in October by mail.

Few things are changing as fast as the office work place. What with things like word processing and electronic mail and telecommunications, it's tough keeping up with what's available today. Let alone what's coming tomorrow.

But that's exactly what we're going to do in our October 16th Office Automation issue of *Computerworld Focus*. And that gives you an ideal forum to sell just about any computer-related office product you have. Because you can surround your advertising with hot, relevant editorial.

We'll start by taking a look at the needs of the end user. And how today's technologies and MIS/DP departments are—or aren't—handling the problems.

Then we'll discuss today's trends and where they seem to be taking us. Trends like top-to-bottom computer architectures. Standardized communications protocols and operating systems. Integrated software. Fiber optics. Cellular radios and phones. Just about every new twist for the office of the future.

So if you've got a product or service that belongs in the automated office, it also belongs here. The **October 16th** issue of *Computerworld Focus*. But hurry, closing is **September 6th** (materials due one week later).

For more information, contact Ed Marecki, Vice President/Sales, *Computerworld Focus*, 375 Cochituate Rd., Framingham, MA 01701 at (617) 879-0700. Or call your local sales office.

APPLICATION PACKAGES

■ **Prime Computer, Inc. has announced enhancements to its Medusa two- and three-dimensional solid modeling software that runs on Prime's 50 series systems under the Primos operating system.**

Features include a text translator, a cross-reference system and a 3-D interface to Prime's Graphics Numerical Control software. Medusa costs $20,000 for use in an office environment to $35,000 for use in a computer room environment, the vendor said.

According to Prime, a revision to the AEC architectural design module of Medusa includes additional exchange menus for layout and symbol manipulation and more symbol menus.

The Medusa AEC costs $7,000 for office systems and $10,000 for computer room environments, according to the vendor.

Prime, Prime Park, Natick, Mass. 01760.

PROFS from page 45

for Profs users. According to one user, "Profs in general eats up disk space."

New users found Profs' text entry and editing facilities difficult to learn, the respondents observed. "The Profs system evolved in a DP environment, and it is not clear that as much attention was paid to the human interface of some aspects of the system as should have been," the report stated. One user commented that, in developing the product, IBM "appeared to have no consideration for the users."

Profs originated in a program development environment as an easy way for programmers familiar with VM to send electronic messages back and forth. One user commented that a weakness of its spelling checker, included among its text creation facilities, is that a user cannot proofread a document while it is on the screen, since the user must return to a menu of editing functions.

A significant weakness of Profs is its incompatibility with IBM's Systems Network Architecture (SNA) protocols, respondents said. "This means there are formidable difficulties in making Profs fully interwork with other IBM systems and architectures," the survey stated. However, IBM stated that its goal is to provide SNA support for VM, even though IBM is positioning the Distributed Office Support System as its strategic office product, the report noted.

To support Profs, most shops required an average of 2¼ people. The average organization requires one Profs support person for every 100 terminal users, according to the survey authors.

Most users surveyed indicated they would still be using Profs in five years, although more than half had plans to integrate Profs with other systems.

The survey, "Profs in Practice," can be obtained for $45 from the U.S. agent for Xephon, MJH Computer Services, 7113 Marvista Court, Orlando, Fla. 32811.

JOIN from page 45

sons, much of Release 7's enhanced functionality is contained in microcode, the "gut-level of the machine," Anderson said, according to a source who heard Anderson speak at a recent meeting of the Northeast System/38 Users Group.

Data independence

Anderson told the System/38 users that the Join function was a significant step in the direction of program data independence — the ability to hide the structure of the data base from the application program — and would have substantial impact in the System/38 community.

Here is an example of how the Join operator can be used on three files: File A lists order, customer number, item number and quantity. File B lists item number and description. File C lists customer number and name. The Join operator allows the creation of File ABC, listing customer number, name, order number, quantity, item number and description. If a value is missing, the system can be programmed to use a default value, and a file can still be created.

Although the release has impressive features, it does not appear to make the System/38 anything more than the niche machine it is now. Cullinet's president said he is not worried about the System/38 stealing away his mainframe-oriented business. Goldman observed that the System/38 uses a 40-bit address space, and its programs are written in RPG.

"It's a very nice architecture and a very good DBMS. The problem is it's not 370 architecture, and it has no tools," such as a fourth-generation language, data dictionary, query language or report writer, Goldman said.

All in all, Anderson said IBM made 216 programming enhancements in Release 7 involving the addition or change of 643,800 lines of code. That much code is likely to have an impact on users for years to come, Andersen said.

How to advertise in every major computer market in the world as easily as you advertise in the U.S.

CW INTERNATIONAL Marketing Services will help you penetrate the most profitable computer markets worldwide — easily, effectively, and economically.

Your ads will receive the attention they deserve. Our network of more than 55 computer publications in over 25 countries is the largest in existence. Over 9,000,000 computer-involved people around the world rely on our publications for the information they need to stay ahead.

With more than 10 years experience in international marketing, we're the only service of our kind. We can help you make your ads more effective. Our local offices can translate your ads for a 15% surcharge on the space you purchase.

We'll help you increase your market penetration. We're also available to advise you on your campaign strategy — such as when to advertise in order to coincide with special-focus issues and trade shows. And you'll be able to advertise in even more markets when you take advantage of our corporate discounts.

All you need to do is send us your advertising materials. We'll handle all the transactions. And we'll bill you in U.S. dollars so you won't have to worry about exchange rates.

Call Diana La Muraglia today if you want to reach the computer buyers in any of the following countries: Argentina, Australia, Brazil, Canada, Chile, Denmark, Finland, France, Greece, India, Israel, Italy, Japan, Korea, Mexico, Norway, People's Republic of China, Saudi Arabia, South Africa, Southeast Asia, Spain, Sweden, The Netherlands, United Kingdom, Venezuela and West Germany.

You can reach her toll-free at (800) 343-6474. In Massachusetts call (617) 879-0700. Or you can reach her through Telex, at number 95-1153. Or, if you prefer, fill out the coupon below and return it today. Do it now. The sooner we hear from you, the sooner you'll hear from our readers.

Negotiating software maintenance contracts

Balance key to productivity

Proper mix at issue

By John Desmond
CW Staff

The secret to making the DP shop most productive, analysts and experts in the field agree, is to balance use of development aids, planning for software maintenance and managing the people involved in the entire system development life cycle.

Just how these three issues should be balanced, however, is often disputed by the experts.

Maintenance aficionado, Nickolas Zvegintzov, editor of the "Software Maintenance News" newsletter complains that vendors are too oriented toward marketing products for software development even though the vendors of maintenance tools have found the market slow going. "It is much harder to use tools than vendors would like it to be. The way to push forward in this market is for the manager to look to the vendor [that] responds to a particular problem. Most companies don't have the resources to bring in the total solution," he said.

Naomi Lee Bloom, senior principal with American Management Systems, Inc. of Arlington, Va., warns that instant productivity will be an unlikely result of bringing in a maintenance tool or a fourth-generation language by itself. "This may sound like heresy coming from a technologist, but I think the real [productivity] issue is management — people management," said Bloom. "Unless staff members are organized and are motivated properly, you do not achieve the productivity improvement factors that the glossy literature promises," said Bloom, who specializes in productivity issues and human resource management.

In Bloom's view, sorting out how to use tools and what productivity gains should be expected are the first steps to implementing tools. She warns managers, however, not to create a "Tower of Babel" effect by introducing too many tools. "A sure way to lower productivity is to expect a person to manage too many tools," Bloom said. "Instead of having 47 different tools that no one becomes expert in, hone in on a set and say, 'That's what we're going to use.' Give your people a chance to become expert, facile with the product."

Bloom also warned that managers should beware of the promise of integration. The integration buzzword is often a misnomer, in part because tools in the same family often require use of different command languages and terminology. She recommends companies pick the best report writer, the best screen painter, the best data dictionary and so on, not necessarily all from the same vendor.

[illegible]

Her approach to the difficult issue of productivity measurement is to compare the known time it takes to execute a specific task with the time it takes to execute the same task using a productivity tool, such as a fourth-generation language.

T. Capers Jones, an expert in evaluating what factors are known to affect development productivity, maintained that the measuring of productivity gains or losses is still the No. 1 DP issue. Jones, chairman of Software Productivity Research, Inc. of Acton, Mass., said, "Lines of code metrics always conceal real productivity. When more power languages like fourth-generation languages are used, [lines of code measurements] are almost totally worthless.

"Once you understand how to measure productivity, you need to identify what factors can be addressed to improve it. Most people think fourth-

See QUALITY SR/10

Tale of two DP shops

Once upon a time in the dream world of DP there were two DP managers, Perfect Perry and Failing Frank, who were at opposite ends of the scale when it came to achieving maximum productivity in their shops.

Perry used a fourth-generation language to increase each programmer's yield of source code. His programmers prepared prototypes to give end users a view of the end product before a full commitment was made to implement. Perry maintained a library of reusable code, which saved time in writing programs with similar functions.

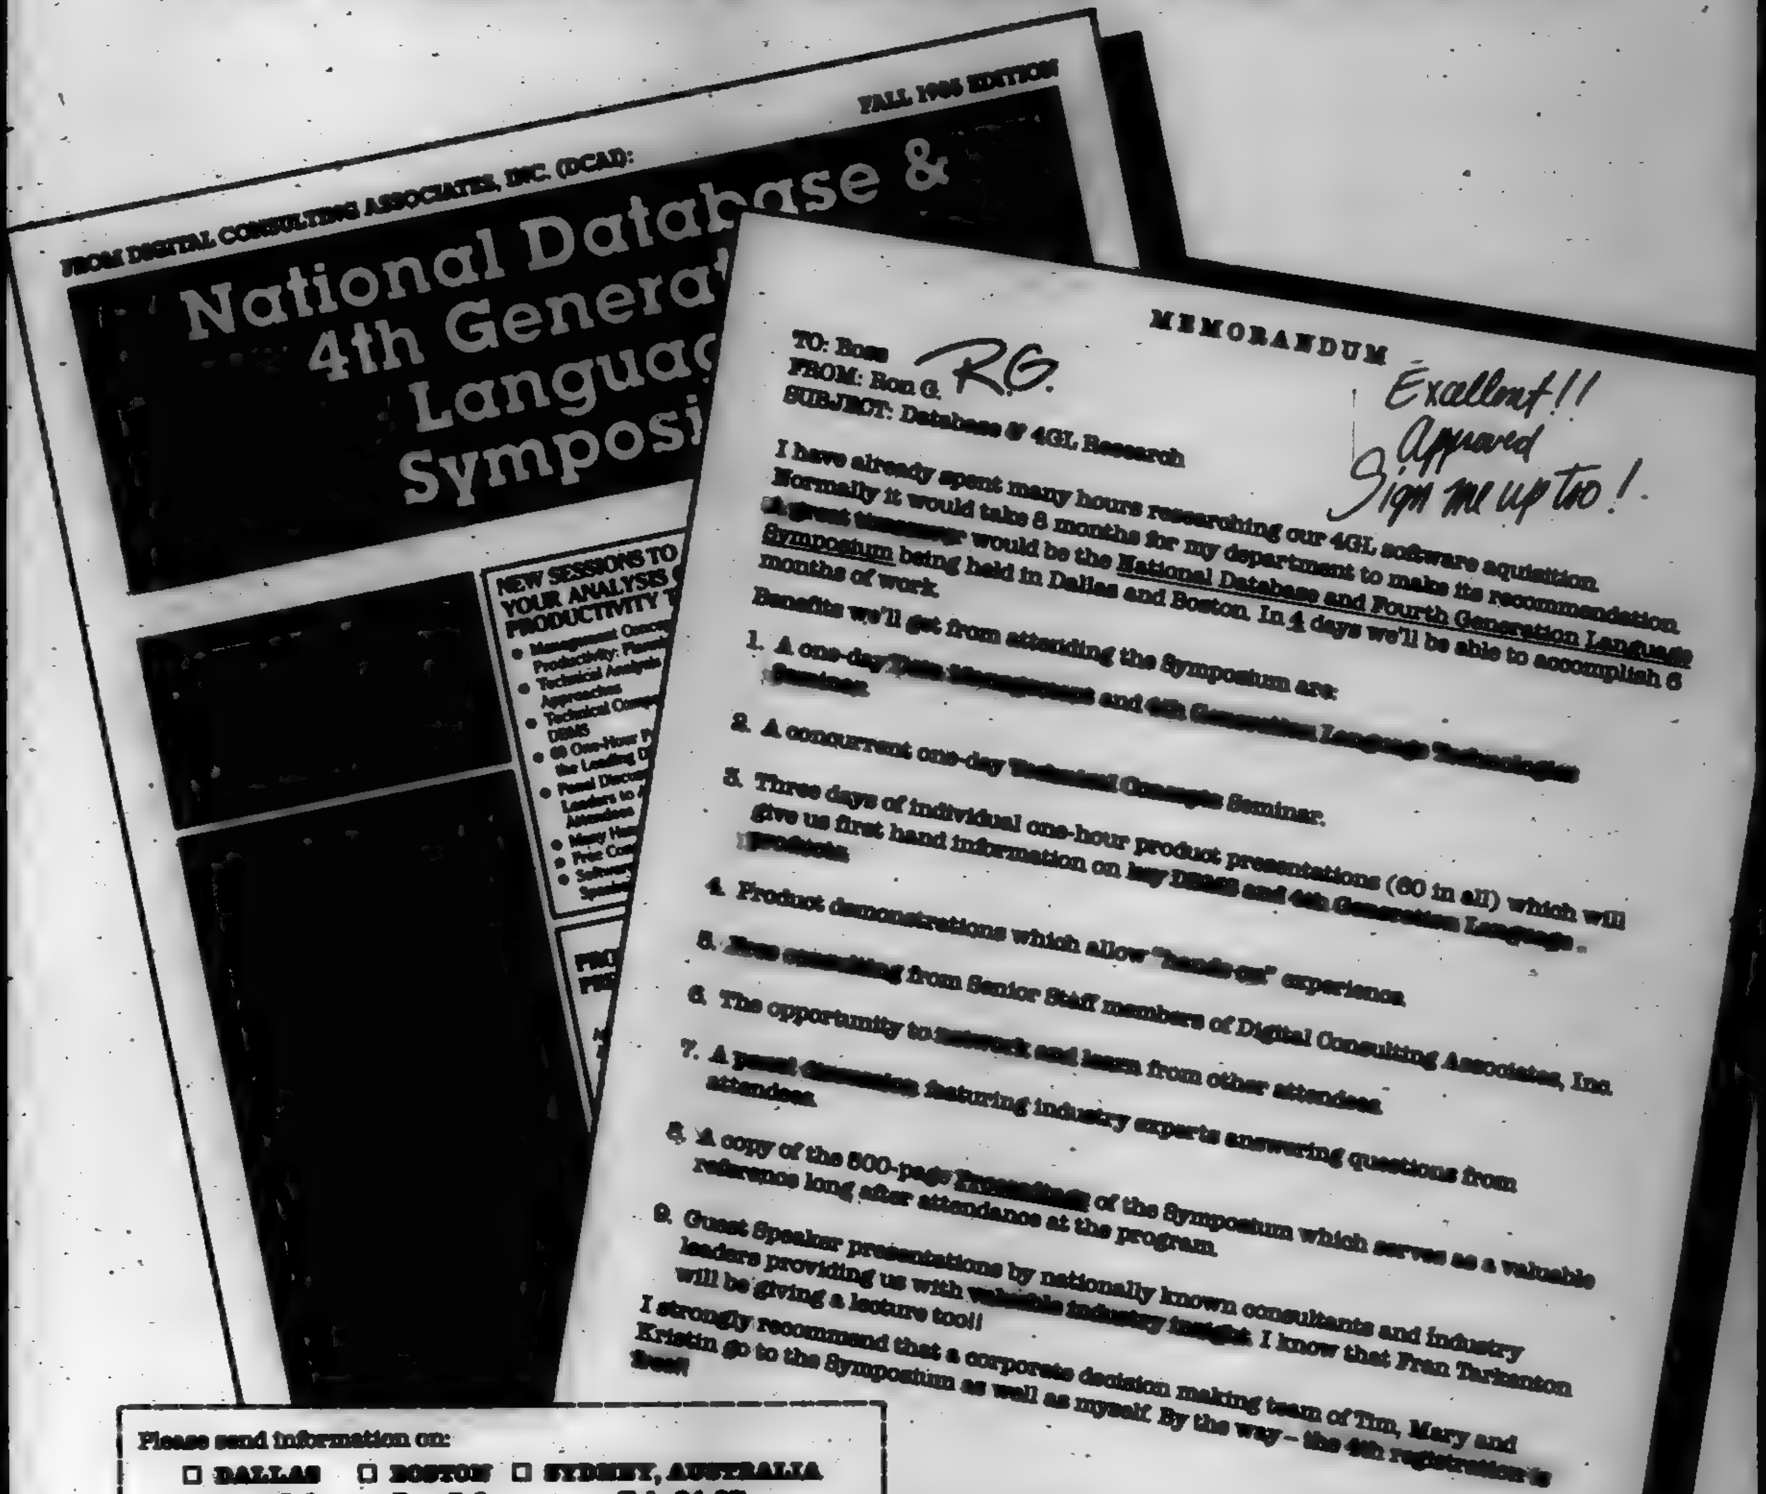
Frank was a Cobol stalwart. His programmers wrote source code in Cobol. He used the classic system development life cycle of requirements definition, specification, design, implementation and maintenance. His programmers kept often-used blocks of code on stacks of index cards in their desks.

Perry catered to his end users, providing them with automated tools that enabled them to solve business problems. Frank required end users to submit requests for applications to the DP shop and then wait in line for their turn. His programmers produced the industry average of 10 to 20 debugged lines of Cobol per day. Frank maintained that his users always wanted more than they could get. Users waited years to get served, then asked for the sun, moon and stars when it was their turn.

In his shop, Perry focused on fundamental issues of productivity, not on the symptoms. He had a management system that tracked requests, assessed projects and reported on accomplishments. Frank kept track of projects in his head. He tried to remember the accomplishments of his staff at salary review time.

As characters, Perfect Perry and Failing Frank are extreme. In reality, most companies are not ready to implement the total solution that Perry displayed, which is usually the most expensive one. And most Cobol users, similar to Frank and despite the wishes of fourth-generation language vendors, seem unwilling to give up on the third-generation mainstay. The real secret to achieving a productive DP shop lies somewhere between these methods.

National Database & 4th Generation Language Symposium



MEMORANDUM

TO: Boss
FROM: Ron G. R.G.
SUBJECT: Database & 4GL Research

Excellent!!
Approved
Sign me up too!

I have already spent many hours researching our 4GL software aquistion. Normally it would take 8 months for my department to make its recommendation. A great timesaver would be the National Database and Fourth Generation Language Symposium being held in Dallas and Boston. In 4 days we'll be able to accomplish 6 months of work.

Benefits we'll get from attending the Symposium are:

1. A one-day Data Management and 4th Generation Language Technologies Seminar.
2. A concurrent one-day Technical Concepts Seminar.
3. Three days of individual one-hour product presentations (60 in all) which will give us first hand information on key DBMS and 4th Generation Language products.
4. Product demonstrations which allow "hands-on" experience.
5. Free consulting from Senior Staff members of Digital Consulting Associates, Inc.
6. The opportunity to network and learn from other attendees.
7. A panel discussion featuring industry experts answering questions from attendees.
8. A copy of the 500-page Proceedings of the Symposium which serves as a valuable reference long after attendance at the program.
9. Guest Speaker presentations by nationally known consultants and industry leaders providing us with valuable industry insight. I know that Fran Tarkenton will be giving a lecture too!!

I strongly recommend that a corporate decision making team of Tim, Mary and Kristin go to the Symposium as well as myself. By the way – the 4th registration is free!

Please send information on:

☐ DALLAS Nov. 5-6
☐ BOSTON Dec. 5-6
☐ SYDNEY, AUSTRALIA Feb. 24-27

Users find problems with fourth-generation tools

Cite programming, performance snags in complex applications

By Paul C. Tinnirello
Special to CW

The tide of popularity for fourth-generation languages is beginning to wash ashore the harsh realities of programming in these new language systems.

Users, especially those who are developing moderately complex production systems, are discovering some significant problems, especially with programming and performance. These problems affect both the application development and the software maintenance processes.

Programming. Many fourth-generation products cannot compete with traditional languages in solving complex application problems. One reason for this lies in the structure of fourth-generation language products; the other emanates from the products' limited range of programming features.

Many fourth-generation products are built on a multicomponent concept, which often includes a reporting tool and an executive language. The reporting tool offers simple and quick solutions to the bulk of many organizations' reporting needs. The executive language offers end users the power to solve traditional programming problems.

Both components are more or less nonprocedural. They will, in other words, allow for the construction of logic without a formal procedure. This nonprocedural environment leaves much of the control to the product and not the user.

In many programming applications, however, user control of logic — even the most subtle control — is essential. Some fourth-generation languages, for example, will not allow for the simple, byte-by-byte editing of an input field. Editing must be done through a mask procedure that may require excessive coding. The cumbersome code that the procedure creates may not be practical for larger systems.

Fourth-generation languages also fall short under another consideration, that of programming strength. Although many fourth-generation languages have eliminated much of the overhead associated with data and file manipulation, they have sacrificed programmability.

Restricted to simple applications

Third-generation languages give programmers strong assets like arrays, functions, string manipulations, looping and block structures. Many fourth-generation languages, however, do not incorporate the full range of necessary logic constructs. By leaving out these features, some vendors have restricted use of their fourth-generation language systems to applications that are simple by comparison.

A programmer who uses a fourth-generation language in production system applications often finds the lack of advanced programming logic frustrating. As a result, his code may be tricky. This has a serious impact on the future maintenance of the system.

It also raises some serious questions about the situations in which a fourth-generation system should be used as a replacement for a traditional language.

These questions may be best answered only after an organization invests in program development under a specific fourth-generation system. By then, one hopes, the organization's staff will have an understanding of the restrictions and limitations of the system.

Performance. Compounding the problem of programmability is the issue of fourth-generation performance, which can be measured in a language's affect on both human and hardware resources.

Organizations have had great success with rapid development under fourth-generation systems. In many applications, human effort has been reduced from several months to a few weeks. This is largely because of the advanced reporting language features that have been the trademark of fourth-generation languages. Integrated application environments, which guide developers through preformatted menus, have also aided programmers.

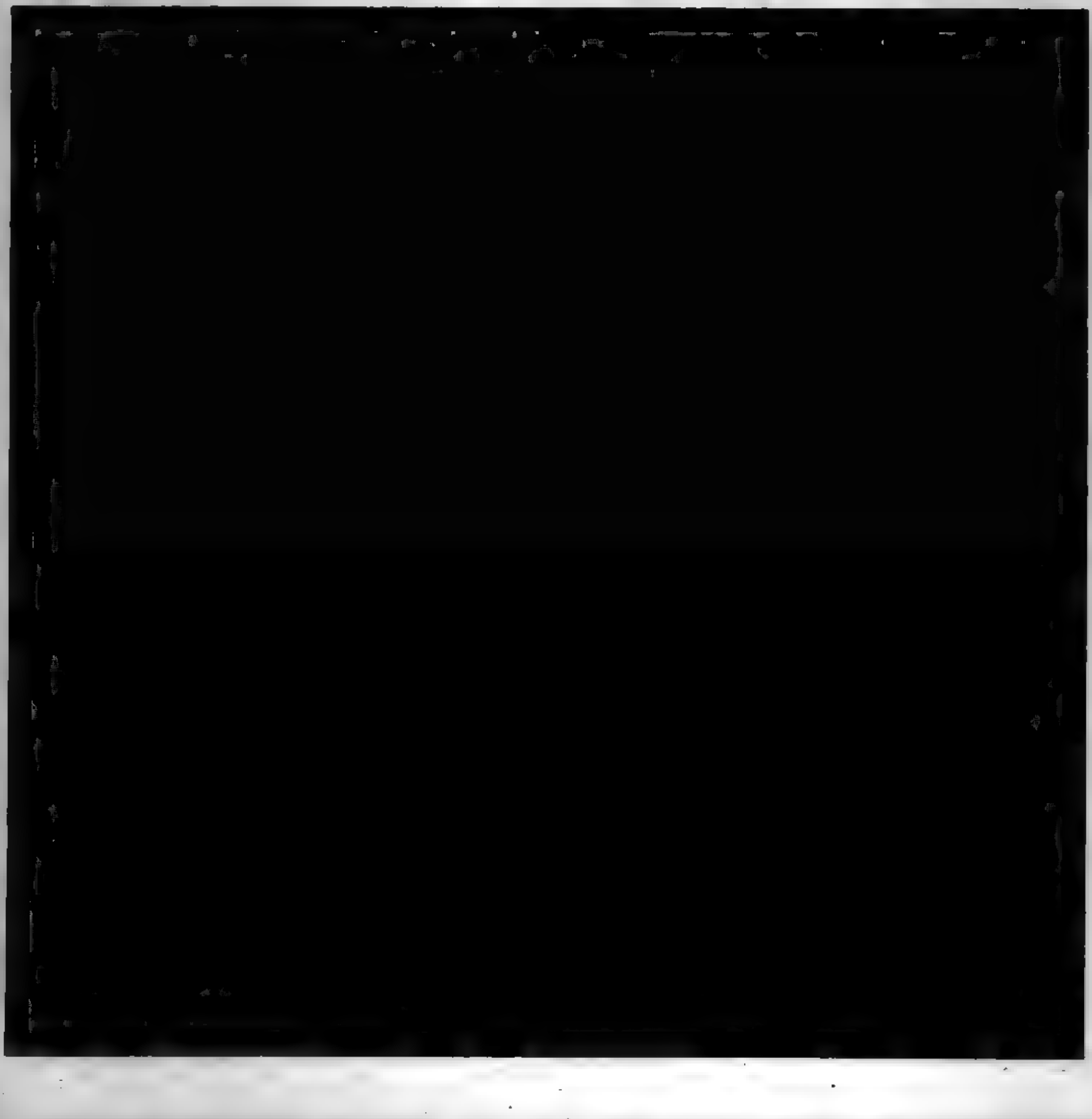
Even though human resource performance has improved, however, hardware resources have been degraded. Perhaps this is because of the overhead required to support the different automatic facilities that make fourth-generation languages so attractive. More then likely, though, hardware performance suffers because of the manner in which high-level languages execute.

Many fourth-generation systems use interpretive code rather than compiled code. This means that execution times will be relatively long. In production systems, lengthy execution time may be prohibitive.

The advantages of compiled traditional languages should come as no surprise; one need only recall the reason why Basic was infrequently used as a major production system language.

Fourth-generation languages can work in a variety of applications, but their scope is limited. Users must work to recognize what fourth-generation systems do best — then apply them to those specific uses.

Tinnirello is manager of programming for the data services department of A. M. Best Co., an insurance publishing firm based in Oldwick, N.J.



[illegible]

As data processing professionals weigh the advantages and disadvantages of the new fourth-generation programming languages, one point becomes clear: The fourth-generation language market is one that is rapidly growing and still evolving.

Currently, no standard exists for these development aids, and it is not yet clear exactly what their impact will be in traditional data processing environments that use third-generation languages.

The *Computerworld* fourth-generation language debate presents two opposing views of these languages. The debate, highlighted below, begins on SR/22.

> *'Automated fourth-generation languages have progressed to the point that they can be used to replace Cobol and Fortran for all but the most complex or time-critical applications.'*
>
> **— Pieter Mimno**
> **See SR/22**

> *'Fourth-generation language vendors will survive by moving away from inventing languages and toward supplying support functions that are compatible with existing languages.'*
>
> **— Nicholas Zvegintzov and Ray [illegible]**
> **See SR/23**

Cobol remains a mainstay as new languages spread

By Arnold Leak
Special to CW

Amid the echoing proclamations of fourth-generation language enthusiasts insisting that Cobol is dead, companies using the venerable language may get the feeling that they're driving Studebaker Larks while surrounded by new sports cars.

With the advent of fourth-generation languages and the associated marketing hype, MIS managers face a dilemma. The urge to use state-of-the-art techniques often conflicts with business realities.

For example, is it feasible for a Cobol shop to adopt a fourth-generation language? Can an MIS manager afford to retrain the data processing staff in the new language? What about converting existing Cobol systems? What about maintenance — can fourth-generation languages be adjusted as easily as Cobol? Must Cobol be abandoned to take advantage of fourth-generation techniques?

After all, Cobol has been around for more than 25 years. It is the most widely used procedural language in the world and is recognized by the American Standards Institute. It provides readability, machine independence and a common base of communications via groups like Codasyl.

In addition, Cobol-literate personnel are easily found, and properly written Cobol code is easier to maintain than most of the cryptic proprietary fourth-generation languages.

Good reason for hoopla

This is not to say, however, that shops using Cobol should become complacent. There is good reason for all of the fourth-generation language hoopla. Until recently, programming methods have barely changed, while hardware has improved drastically. Although computer hardware costs have dropped, the application development effort is still as labor intensive as ever. Thus, software development costs continue to rise.

Even though DP departments are hard at work producing applications to make the rest of the organization more productive, the computer's power has not been fully harnessed to enhance the development and maintenance of those applications.

With the need for efficient applications growing at better than 45% annually, coupled with existing backlogs, MIS managers are behind the eight ball trying to improve programming productivity in terms of both quantity and quality.

Considering the tedium and labor intensity of hand coding, testing, debugging, maintaining and upgrading applications, it is inevitable that, using traditional application development methods, the application backlog will increase rather than decrease. And, to compound this problem, each year a larger piece of the MIS budget is absorbed maintaining existing applications rather than focusing programmers' talents on the production of new applications.

Applications development productivity must increase exponentially to establish and maintain a workable programming environment. Therefore, it is logical that productivity tools are gaining widespread acceptance among those who realize the critical importance of application development productivity.

To reduce realistically the application backlogs and offset expected programmer shortages, hand-coded Cobol must be minimized.

There is no justification, in general, for retaining this labor-intensive method of application creation in a marketplace flooded with high-powered productivity tools. There is, however, reason for MIS managers to be reluctant to change over to fourth-generation language application development from Cobol.

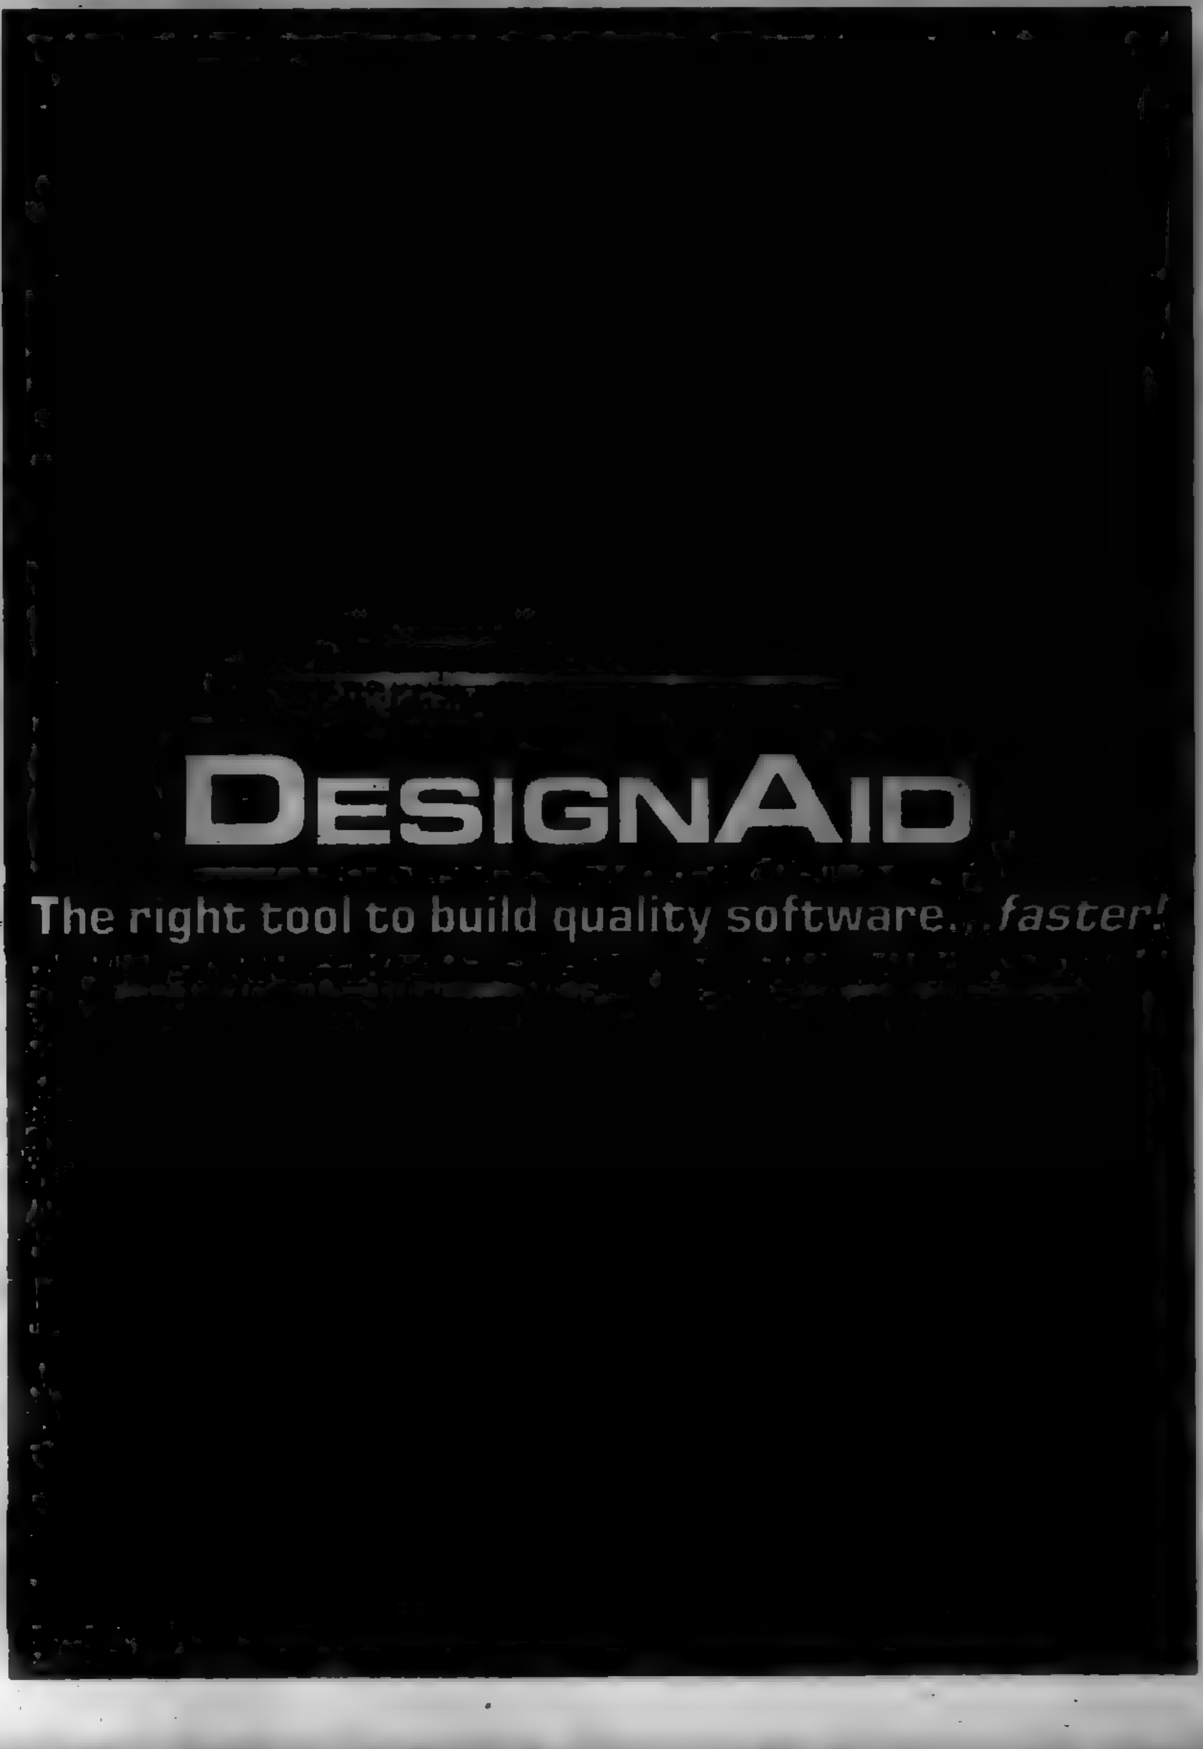
What MIS managers should be looking for are products that support their current operations while taking advantage of new technology.

Although current publicity implies that fourth-generation languages are required to be progressive, what is important are the techniques behind fourth-generation languages. It is not necessary that fourth-generation languages be used but that the gains promised by these methods be applied to the creation of applications.

In the case of Cobol shops, an application development system using fourth-generation language techniques can produce Cobol code at rates that rival many of the fourth-generation languages available.

MIS management can take advantage of productivity tools that use fourth-generation approaches to gain the most from fourth-generation languages. This can be done by understanding what these languages are all about (see story SR/30) and by shopping for tools that provide a compromise between fourth-generation languages and realistic constraints such as Cobol. What MIS managers have is a practical choice, not an either-or situation.

Leak is vice-president of technology for Commercial Systems Laboratories, Inc. in Auburn, Ala., the producers of C/Script II, a fourth-generation Cobol application development system.



Reusable code paying off in variety of applications

Effective in systems doing similar tasks

By T. Capers Jones
Special to CW

For really large systems — those with more than 100,000 source statements — third-generation languages hold all the world records in productivity.

In this top class, moreover, every record holder depends on a variation of one particular technology — the construction of programs and systems from standard, reusable modules and the reliance on standard, reusable designs.

Not every system, or even every industry, can make use of this technology at the present time.

Reusability has been most successful for programs and systems that have similar or identical processing and data requirements, in fields such as banking and insurance, where even competitive companies perform more or less the same kind of processing.

In government and industry

The following is a brief survey of the current status and future prognosis for reusability in selected industrial and government sectors:

Aerospace. The space shuttle — not its software but the aircraft itself — is the most prominent aerospace example of reusability. The National Aeronautics and Space Administration, however, is also making effective use of reusable software. A recent study that Nasa commissioned cited more than 60% reusability among sampled applications in several operating groups.

In the civilian aerospace sector, airline reservation systems are a classic example of the kinds of systems that are natural for reusability. These systems require high transaction volumes and are found in an industry where one finds essentially identical processing requirements among direct competitors.

On the whole, aerospace has an effective history of reusability and a good prognosis for the future.

Banking. Many banking and financial applications are essentially identical, even among competitive enterprises. This phenomenon has been demonstrated in New Zealand, where banks use standard software under government control.

Large banks — those with more than 500 programmers and analysts — typically develop standard reusable code and designs for their own use. Small- and medium-size banks, which employ fewer software professionals, are able to buy standard banking packages in modular, reusable form; they then add minor additional features as needed.

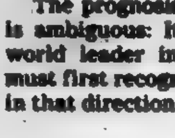
Banking is one of the primary domains where reusable designs and reusable code have been valuable, and this should remain so in the future.

Department of Defense. As the world's largest user of computers and software, the DOD might be expected to have established itself as the world's leader in software innovation and effectiveness as well. This, unfortunately, is not the case.

Unlike the Japanese Ministry of International Trade and Industry, which is playing a dynamic part in both computing and software, the DOD is relatively inert in leading-edge issues.

While the Ada language and its supporting environment are mildly innovative and can eventually give some support for reusability, the fact remains that the DOD has no serious program in place to create, stock or supply standard reusable designs or reusable code to the defense community.

The prognosis for the department is ambiguous: It may yet become a world leader in reusability, but it must first recognize the need to move in that direction.



Federal government. With an ever-growing bureaucracy and ever-mounting expenses, the civilian agencies of the federal government could find substantial economies in lateral coordination, use of reusable designs and use of standard reusable

See REUSE SR/7

SCHEDULING, NATURE'S WAY.

Our Scheduling System Does Something Nature Doesn't Do. It Schedules Jobs For MVS Environments The Same Day It's Installed.

With *ADC2, Automated Data Center* management information system, your company is just a day away from getting its computer operations under control. That's because Cambridge designed ADC2 to be fully productive the day it's installed.

ADC2 builds schedules and makes all data center management information readily available, ensuring increased control and throughput. It can also cut processing time by *more than 25%*.

Users find this high-performance system software simple to learn and easy to use.

ADC2 monitors all jobs automatically. Performance statistics are dynamically gathered and maintained as current and historical data for quick on-line access.

For even more convenience, a decentralised scheduling feature allows different departments and remote sites to simultaneously create and manage their daily job schedules with simple commands.

So if you're wrapped up in scheduling problems, find out how to emerge with more control over your data center's activities.

Call or write The Cambridge Systems Group. Ask for an on-site, on-line ADC2 demonstration *with your own data.*

REUSE

from SR/6

code from agency to agency.

This fact is certainly known by the General Accounting Office and the General Services Administration. Both agencies have had partial and intermittent successes in their efforts to introduce standardization and shared technologies across various federal agencies. As those who have worked within the federal government recognize, however, it is not easy to achieve lateral coordination across such a vast and essentially feudal type of enterprise.

The prognosis for the federal civilian government is not overly favorable: Reusability is recognized as desirable, but the mechanisms for actually putting it into practice are probably insufficient.

Health care. The 1984 rate of increase in hospitalization costs was only 4.5%, compared with 10.2% in 1983. A major factor in the reduction was increasing recognition by health care professionals that shared technologies and reusability are highly effective.

More than 75% of American hospitals currently participate in various technology sharing programs. Blood banks, laboratories, nuclear medical facilities and data processing shops are examples.

The general prognosis for reusability in the health care industry is quite good: A long history of technological sharing and the need to lower costs are making the use of common designs and reusable code very active concerns for professionals in the health domain.

Insurance. The insurance industry has been one of the leading users of computers and software since these first became available. Today, large insurance companies are among the most software-intensive enterprises in the world. Programming staffs of between 1,000 and 3,000 professionals are not uncommon.

Standard reusable designs and reusable code are perhaps further along in the insurance industry than in any other.

The prognosis for reusability within individual insurance companies is not at the same level. Overall, however, insurance reuse is quite respectable.

Municipal governments. All municipal governments share a good number of similar data processing problems — for example, how to process taxation, land zoning, building permits, police business and school records.

Theoretically, then, standard municipal software designs and libraries of reusable code should be quite effective.

Sometimes they are, such as in the area of shared data processing services among police agencies. But governments, by nature, tend to be parochial, which somewhat lowers their abilities to cooperate laterally and share software.

The overall prognosis for reusability within municipal governments is ambiguous but positive: In the long run, we are likely to see as much as 40% commonality in basic applications.

Public utilities. The ever-increasing spiral of rates for natural gas, electricity, water and telephone services highlights an important point — public utilities need to do all they can to lower their costs.

Because the public utility sector deals with common application types, its member utility companies should be able to share common designs and common code with each other, yet they have not done so as fully as they might.

The utility companies in the past — under full regulation — were not always particularly innovative or cost conscious.

Recent trends toward deregulation and the introduction of cost consciousness within the segment, however, have made exploratory use of standard software a significant topic.

The overall prognosis for reusability within the public utility sector is quite favorable: The climate is right, and the companies have strong motivation.

State governments. State governments share many common problems, require substantial DP and computing support and are relatively sensitive to voter feelings. These three factors may catapult U.S. states governments ahead of the U.S. federal government.

Already, state governments have an effective common data base of drivers license and motor vehicle information. With the success of such data bases in mind, larger efforts to hold data in common may occur.

The overall prognosis for reusability at the state government level is fairly good: The early steps have been visibly useful and may serve as models for more extensive reuse.

Transform your Mainframe programs

. . . with VS COBOL Workbench

Are your mainframe applications hard to change? Consider a new approach.

VS COBOL Workbench* puts onto a PC an integrated programming environment enabling a programmer to be totally immersed in continuously productive programming. Programmers can enjoy a higher degree of satisfaction and creativity without the frustrations associated with development on a mainframe.

Your applications can evolve by taking advantage of improvements in COBOL. Workbench adds the IBM* COBOL language extensions in OS/VS COBOL and the new VS COBOL II to a full implementation of ANSI '74 COBOL (including Report Writer) plus features from the proposed ANSI '85 standard. There are flagging options for each of these four variants so you can set installation standards or move to the latest form of structured programming in a controlled way.

The integrated programming environment in Workbench, which complements this unique language combination was pioneered by Micro Focus* in Professional COBOL which ranked first in independent reviews in the July PC World and the August PC Tech Journal. PC Tech Journal's Ted Mirecki also said our customer service *"sets an example to the industry"*.

By the way, Workbench can also be used for PC resident applications in VS COBOL and in its V1.2 release the VS COBOL Compiler used in Workbench produces faster running code than any other COBOL Compiler for the PC. But what is really important is the thoroughness of our implementation of the compiler and the integrated products like Animator*, still the most highly regarded interactive visual debugging tool available.

You can also add other products like CO-Mage* to Workbench to quickly generate IMS/MFS or CICS/BMS macros and their associated COBOL statements. And if you love your mainframe editor then micro/SPF* produces an exact equivalent but with the rapid response time of the personal computer.

To find out more about Micro Focus products just call or write.

Rapid prototyping matches system to user needs

By Linda Brice
Special to CW

Rapid prototyping has yet to transform software development, as its staunch supporters expected, or to prove itself a disaster, as its strong detractors predicted.

The technique simply has not been around long enough for all of its strengths and weaknesses to have evolved. No one has the time and money to conduct a controlled study where a large system is developed in duplicate — once with prototyping, once with traditional methods — holding all human and machine conditions constant to weigh the two approaches against each other.

Rapid prototyping has, however, already emerged as a solid technique to improve one aspect of productivity: that of delivering the right system for a user's present environment, a system that will evolve as the user's needs change.

Under this technique, developers bring up a physical representation of key parts of a system before the system gets implemented. Users then have the option of canceling their development requests, looking to packaged software for a better solution or allowing the DP department to continue its work.

If the users cancel their requests or seek packaged software, the DP backlog shrinks, and it shrinks more quickly than it would if users had to wait for lengthy specifications to be written and approved. The discarded prototype does not represent wasted effort. Rather, DP will have wasted less effort on the rapid prototype than it would have on a full system that worked but did not meet users' needs.

If the users like the model and decide to continue with development, the prototype improves programming productivity.

Prototyping saves the DP department time because communications between users and software developers are stronger than they would have been had the developers used traditional paper models.

In some cases, the prototype can even evolve into a final production system. Rarely, and in only the most simple of systems, however, can a prototype become an implemented system.

Because prototyping can help users quickly define their needs and because it can shorten the tuning phase of system development and reduce enhancements, the technique can reduce DP applications backlogs and help users decide not only what they want but also what they need and what they can afford. To bring on these benefits, however, prototyping must be done correctly and with the proper tools.

Methodology. Under most circumstances, a prototyping methodology should include most or all of the following phases:

- Planning — in which developers and users lay out rough, flexible schedules.
- Rapid analysis — in which developers draw up a very brief, high-level paper model, usually using a visual aid such as a data flow diagram.
- First-cut prototyping — in which developers produce a working model.
- Prototype iteration — in which developers seek users' suggestions and incorporate them into the working model until the users accept the model.
- Benchmarking — in which developers test performance to determine how the sytstem will respond in production.
- Training — in which the developers teach the organization's software maintenance staff any prototyping methods and tools that have been retained in the implemented system.

Tools. In his book, *Applications Prototyping: A Requirements Definition Strategy for the '80s* (John Wiley & Sons, Inc., 1984), Bernard H. Boar suggests that DP would benefit from having a prototyping center, a tool kit that contains a number of productivity aids. Following are the tools he indicates a prototyping center should include:

- A text editor.
- A data base manager.
- A procedural language/program generator.
- A teleprocessing monitor.
- A screen generator.
- Dictionary maintenance tools.
- A nonprocedural report writer.
- An interactive query language.
- A documentation reporter.

A number of data base management systems on the market feature all or most of these components in one package. Because it is important to be able to modify data storage structures quickly and easily during rapid prototyping, users will benefit most from a DBMS with a relational structure.

Brice is a staff member in the administrative data processing division at Los Alamos National Laboratory in Los Alamos, N.M. She is cowriting a book, The Professional User's Guide to Buying Software, *with John Connell, a computer systems engineer at Martin Marietta Corp. Denver Aerospace. Van Nostrand Reinhold Co. expects to publish the book in September 1986.*

MAN'S PRODUCTIVITY HAS ALWAYS BEEN LIMITED BY THE LANGUAGE HE USES.

"Do you spell that with a bird or a tree?"

And no one knows it better than a programmer.

With this in mind, we at ADR® realize the best way to make programmers more productive is to provide them with more efficient programming languages.

ADR/IDEAL®, our 4th generation application development system, automates programming, so it makes the computer help programmers be more productive.

ADR/IDEAL applies a 4th generation language to all phases of an application's life cycle, which makes the entire programming process more productive.

And ADR/IDEAL's easy to understand language lets non-programmers develop their own applications. And that gives programmers more time to be more productive.

ADR/IDEAL is complete enough to be the only true replacement for COBOL. But since most of your applications are COBOL-based, you just can't abandon COBOL. So we won't. In fact, ADR is the only software company that offers an enhanced COBOL language as well as a 4th generation language.

ADR/DL™, our high-level extension of COBOL, significantly reduces the amount of coding and maintenance necessary, which makes programmers more productive.

ADR/DL brings the active dictionary support and the powerful data manipulation language of a relational software system to the COBOL environment. Which also helps programmers be more productive.

ADR/DL can produce whole sections of COBOL code with a single command. And that certainly makes programmers more productive.

Both ADR/DL and ADR/IDEAL use intelligent editors to generate bug-free code. So, with an ADR programming language, programmers work faster and better.

Man's productivity may indeed be limited by the language he uses. But by significantly reducing the time it takes to create and maintain an application, ADR programming languages are helping productivity reach new heights.

For more about ADR programming languages, mail us the coupon. Or call 1-800-ADR-WARE and discover that, at ADR, increasing productivity is more than just talk. It's language.

QUALITY from SR/2

generation languages will be sufficient, when in reality, they are not and probably never will be," Jones said. The largest programs ever developed in a fourth-generation language are relatively small, the equivalent of approximately 50,000 lines of Cobol.

"You can't do big systems in fourth-generation languages because of the performance penalty you have to pay," Jones asserted. "The rule of thumb is that it takes five or six times as much machine time to run an application written in a fourth-generation language."

The first step toward improving productivity is to understand how much is being spent on software or the total cost of developing and running a package. "The biggest expense element over the life of the package is getting rid of bugs. One of the most effective ways to cut costs is to minimize defects.

'Aim for quality'

"Aim for quality, and productivity is a natural by-product," he said. "If you forget quality, it's technically impossible to make really substantial productivity gains."

Capers agreed that management is crucial to better development productivity.

A skeptical outlook on the productivity improvement promise of fourth-generation languages is that of Tom O'Flaherty, principal of Information Service Strategies of Woodridge, N.J. Allowing end users to use complex systems is a primary way to improve productivity, but "really critical end users don't have time to learn computer languages," O'Flaherty said.

O'Flaherty disputes estimates that fourth-generation languages improve development productivity by a factor of nine or 10. Actual coding is 10% to 20% of the cost of a development project. If development is one-third of lifetime software costs, that is a 3% to 6% savings over the entire life cycle, he said.

Companies can improve productivity by being heartless with end users, O'Flaherty suggested. "You can be productive, or you can do what the end users want," he said.

"Managers have to tell the end users they will be heard but will not be central [to decision making]. Otherwise, DP will not be efficient."

[illegible] outlive life cycle of the organizations who buy them. The SEED DBMS is designed to grow with your organization and withstand the test of time.

Total portability for constantly changing hardware.
SEED is the most powerful transportable DBMS software available today. You can transport SEED applications from your DEC VAX, DEC 10 or 20, and PDP 11 to an IBM 30XX, 43XX, 370, or PC to a PRIME, Gould SEL or any other compatible computer. No other DBMS offers you such a wide range of hardware compatibility. SEED Software allows you to do applications on your mini with the same results of your mainframe and do applications on your mainframe for the same cost of developing them on a mini.

Performance you won't outgrow
SEED provides optimized use of your hardware for exceptional application performance. With SEED, DBMS designers now have the ability to quickly control and fine tune the physical data base design and memory utilization to optimize data storage and retrieval speed. The application programmer is provided with an entity/relationship model of the data base, while the end-user's view of the same data base is relational.

- DATA DEFINITION AND HOST LANGUAGE PROCEDURES
- INTERACTIVE DATA MANIPULATION LANGUAGE
- SCREEN FORMATTER
- INTELLIGENT FILE CONVERTER
- LARGE DATA VOLUME CAPABILITY
- SECURITY
- INTEGRITY
- DATA DICTIONARY

- QUERY LANGUAGE
- REPORT WRITER

Increased productivity
With SEED Software, you can increase productivity and response time, reduce errors and save precious programming time. Its English-like commands make it easy to learn and use.

SEED's comprehensive data base design facilities eliminate the need to define or manipulate inter-record relationships for each application or end-user; once a DB designer has described the data base, that definition works for everybody. End-users do not need to know how to "JOIN" records to pose a query or write a report. DP and project managers in business, government, military, research and academia are using SEED to get the maximum productivity from both their hardware and human resources.

SEED [illegible] comprehensive hands-on training program that helps you get your system on-line quickly and easily. The full resources of SEED Software are available to quickly answer your questions through our toll-free Technical Service Hot Line. We also offer top quality, cost-effective data base consulting and applications development services.

SEED Software is backed by ManTech International Corporation, a multi-million dollar engineering, consulting and management organization. With twenty-six offices in the U.S. and major European, Asian and Middle Eastern cities, the ManTech family of companies is dedicated to providing comprehensive high technology services to its customers.

Development tools market on the rise

The market for development aids such as fourth-generation languages, which are seen alternately as a replacement for Cobol or as merely a productive way for end users to request corporate data, is a growing one.

International Data Corp. (IDC), a Framingham, Mass., market research firm, is projecting the market for fourth-generation languages based on data base management systems to grow an average of 40% each year until 1989.

IDC estimated the total market for fourth-generation languages, including those for personal computer, mid-range and large systems, is $265 million this year. IDC projects an increase to $993 million by 1989.

The maintenance tools market is a harder one to quantify, according to the guru of the maintenance market, Nicholas Zvegintzov, editor of the "Software Maintenance News" newsletter.

No good figures exist on the sales of maintenance tools, according to Zvegintzov. He has approximately 15 advertisers in his newsletter marketing maintenance tools for Cobol — products such as a source code file compare. No maintenance tools exist yet for fourth-generation languages, but some will eventually be needed, he noted.

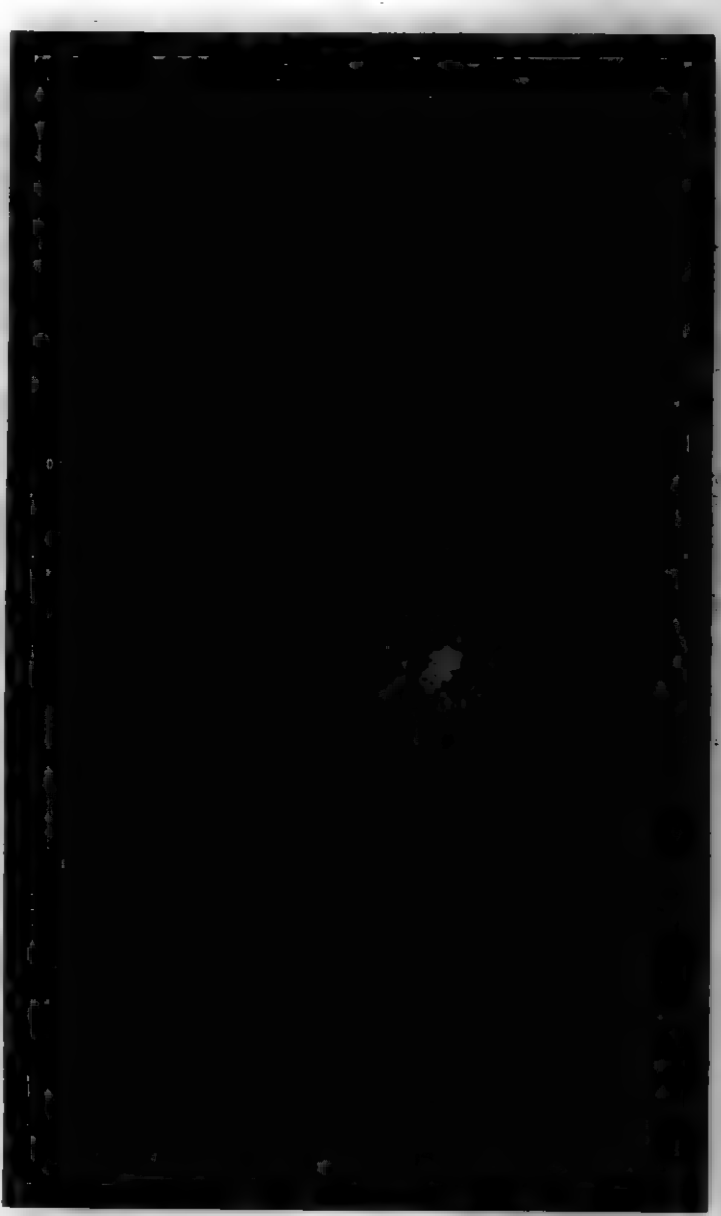
The time has come for straight talk about database management systems.

"The only reason to buy a database management system is to build better applications."



Throughout the history of the software industry, proponents of one database architecture after another have promoted their respective systems as the sole solution to a company's application backlog problem.

The early debate centered on hierarchical versus network architecture. Advocates of inverted file entered the argument in the 70's. And today, relational is the architecture of choice.

While this discussion about architecture is interesting, it's just not the issue.

Database management systems, beginning with the very first, were created to do one thing and one thing only—they were created to build better applications. *Building applications—efficient, online applications, faster, with fewer people—is the only real issue.*

Today corporations have a huge backlog to contend with. And the applications they need to develop have different characteristics. Some may be retrieval only. Some may be heavy on update. Some will run the company, and will require professional development. Some can be created by end users to satisfy their own needs.

It is extremely important to have a database management system that can handle all applications. *It is essential* that a database include tools rich and comprehensive enough to accommodate both the professional developer and the end user. It's the richness and power of these tools that's critical to the successful implementation of highly responsive fourth generation applications. What's demanded, in fact, is software that goes a *step beyond* today's conventional relational database systems.

With a comprehensive database management system and the appropriate tools like the kind I'm talking about, you'll make the data processing department a *strategic asset* instead of corporate overhead. You will make your company succeed in a highly competitive world.

In Cullinet's new Annual Report, Presidents and CEO's of major corporations speak about the positive impact Cullinet has had on their operations. For a copy that you might like to read and pass along to your company president, write to me. I'll see that you get one.

J. J. Cullinane

John J. Cullinane
Chairman of the Board

© [illegible] Cullinet Software, Inc., Westwood, MA [illegible]

The only database management system worth buying is one that meets these six requirements.

Stated simply, IDMS/R is a step beyond today's conventional relational DBMS because it meets these key requirements for building successful applications.

1. MIS Application Development Facilities

The application development system required to build high performance production applications requires more than a fourth generation language. Cullinet's ADS/OnLine is a comprehensive application development environment for the MIS professional combining fourth generation language with a menu-driven modular development approach. Integrated with the data dictionary, this minimizes not just the programming but the entire design, development and documentation of an application. Furthermore, this approach produces a dramatic reduction in maintenance and support.

2. End-User Application Development Facilities

Because Cullinet recognizes the difference between production and end-user applications, as well as the need for both to share common data, we provide an easy to use end-user oriented development and inquiry system. The Automatic System Facility of IDMS/R is a non-procedural, menu-driven tool designed for end-users. Once data tables are defined, an application is automatically generated. The query facility of IDMS/R provides menu-driven query capability and full online help, so end-users can build working applications in minutes and get reports easily and efficiently.

3. Relational Architecture

IDMS/R allows for the definition of databases using the relational data model. Data tables and associated user views are easily defined online. Additionally, any number of key fields may be defined. IDMS/R also supports advanced relational features including referential integrity and domain definition. This architecture provides the capability to address all application requirements.

4. High Performance Database and Application Tuning Facilities

IDMS/R is a full multi-tasking, multi-threaded system providing for concurrent processing of online and batch, update and retrieval applications. Additionally, tuning facilities provide efficient indexing techniques, space management, page management, and buffer management. No conventional relational DBMS has these capabilities.

5. Dictionary Driven DBMS

Data integrity and data independence are essential in a DBMS environment. The dictionary actively controls the source and use of all data. Data definitions, data validation criteria, data formats and security are all defined within the dictionary and exist only once, eliminating redundancy and ensuring integrity. This information is then automatically used throughout the system. Examples of the functionality of this facility include never needing to define output formats for query; never needing to define field attributes for screens; never needing to code validation and editing criteria when using ADS/OnLine. Only IDMS/R provides this level of dictionary integration.

6. Open System Architecture

With the unique Open System Architecture of IDMS/R you can maximize your investment in existing software. IDMS/R accepts data from outside the database environment with direct access to VSAM files. In addition, applications written to access other databases like IMS, DL/1, TOTAL, or VSAM can directly access IDMS/R without modification. IDMS/R is designed to work in virtually all IBM mainframe operating systems and teleprocessing monitor environments.

IDMS/R: More than a relational DBMS

Special Report

Software tools improve firms' performance, conserve time

USER REPORT

COMMERCIAL UNION INSURANCE CO.

Problem:
Too many runtime abends.

Solution:
Tool that identifies JCL errors.

Benefits:
Decrease in demand on CPU and personnel.

BOSTON — The operations support staff at an insurance firm here cut its number of runtime abends in half and saved related CPU and staff time after it installed a software utility that flags errors in job control language (JCL) modifications.

Commercial Union, a worldwide property, casualty and life insurance company, once logged approximately 35 abends in the more than 300 production jobs it ran each night, according to Ed Swartz, manager of operations support services for the firm. Since the firm installed the software tool, he said, about 17 jobs have abended each night.

Because fewer jobs need to be rerun, the firm has decreased demands both on its mainframe hosts, a 24M-byte IBM 3081 and a 16M-byte 3083, and on its operations staff. "In the past, we had people in production who did nothing but fix abends," Swartz said. Commercial Union dedicated one operations staff member on each of four shifts to that job. Since the firm installed the utility, every staff member has been able to perform a number of duties.

Commercial Union installed the tool, Triangle Software Co.'s JCLcheck, in March 1982, as part of an effort to manage production. "We needed to integrate or centralize all our job documentation and get control of our entire operations," Swartz said.

Since then, the firm has used the product in a number of projects, including a large storage conversion Commercial Union completed in February. For this project, Swartz's staff had to migrate thousands of data sets from mass storage to disk and tape.

The job entailed making modifications to block sizes, finding locations where data sets were used and determining whether data migrations were valid. In an effort to keep track of the JCL changes and make sure they did what they were designed to do, Swartz's staff invoked JCLcheck both before and after it ran JCL modifications.

Before a job ran, the software flagged errors in proposed JCL modifications; afterward, it validated all changes (it checked, for example, to see that data sets indicated in JCL statements actually existed).

The software tool ran under MVS/XA on both the firm's mainframes. To start the tool's error-checking process, staff members ran JCLcheck and JCL modifications against each other in batch mode. Whenever the utility detected an error, it notified the users on-line. As output, JCLcheck printed all faulty JCL statements along with a description of the problems in those statements. Users then corrected the errors, ran the modifications against JCLcheck again and repeated the process until no errors surfaced.

With the help of the utility, Swartz's staff completed the conversion less than one month after the firm layed out detailed plans for the job. He estimated that the project would have required approximately six months if programmers had to do manual reviews of each JCL modification and validate its relation to other changes. "With the JCLcheck product's cross-referencing capabilities, we have absolute confidence in making across-the-board changes," Swartz said.

Commercial Union's staff uses the utility to clear every change they make to their system's JCL. This is especially important to the firm, Swartz said, because its DP shop is in a constant state of flux and needs to keep abreast of all JCL modifications.

"Our shop has been involved in upgrading one of our mainframes, getting rid of a mass storage unit, adding new software [and] undergoing a disk conversion, pretty much simultaneously," he said. "With the JCLcheck utility, necessary changes in JCL can be made swiftly and efficiently."

The utility has eliminated visual reviews of JCL modifications at Commercial Union, allowing analysts to spend time on less tedious tasks, according to Swartz.

USER REPORT

MANUFACTURERS HANOVER TRUST CO.

Problem:
Applications testing forces staff to work overtime.

Solution:
Automated testing tool.

Benefits:
Workers have weekends off; backlog gets cut.

NEW YORK — A financial firm here reduced the number of weekend hours its employees had to work and increased the number of days its DP staff could devote to CICS applications testing after it installed a tool that automated the testing procedure.

Until this spring, Manufacturers Hanover Trust Co. did most of its testing on weekends, according to Kenneth A. Hamilton, senior vice-president of global wholesale systems. The firm's interactive transaction processing applications — funds transfer, letters of credit and the like — had been integrated around IBM's IMS on a 32M-byte IBM 3081 and were too complex to test during normal working hours.

"Because of the interactive nature of our systems, we could not bring up a complete production parallel system in the 9-to-5 environment," Hamilton said. "So, we typically came in on weekends."

The schedule had the following two drawbacks:

- Because changes to one module affected others, employees from many different departments had to participate in the tests. On any given weekend, clerks and managers from different user departments had to join data center staff members and applications programmers in the shop.
- Because every year had a finite number of weekends, the DP shop developed backlogs and delays. Manufacturers Hanover had only 52 weekends in which to test between 18,000 and 20,000 annual changes and additions to program modules.

The testing procedure relied heavily on manual labor. After programmers added or changed a module, employees from the firm's user departments ran tests of related modules that the change would affect. The users then checked output from the original system against output from the changed system to make sure the results matched.

User acceptance and environmental testing for a major change (a product offering, for example) often required between 10 and 13 weekends of work, Hamilton said. Manufacturers Hanover installed the automated testing tool, On-Line Software International, Inc.'s Verify, to streamline the process and speed up system delivery.

To test a modification, a programmer now calls on the tool to run regression analyses of system output. The tests compare results obtained from the original system against results from the modified system, and the tool generates output that flags any discrepancies. Because the tool checks for errors systemwide, employees do not have to initiate and run a test over and over, once for each of an application's modules.

After system operators at Manufacturers Hanover became familiar with the tool, they could run an automatic test stream in about one-tenth of the time they had needed for manual transaction entry, according to Hamilton.

"What Verify does for us is to collapse the time necessary to introduce changes to our systems," he said. "It allows us to test new systems and enhancements automatically during the normal workday and reduces the need to bring people in on the weekends." The firm still tests some of its new systems on weekends, but fewer people have to show up for the trials.

Because the firm has only used the tool for a few months, Hamilton said he is cautious about predicting its impact. He estimated, however, that Verify will cut applications testing time in half for most applications and will pay for itself in less than one year.

USER REPORT

LIBERTY MUTUAL INSURANCE CO.

Problem:
Spaghetti code imposes maintenance problems.

Solution:
Tool for structuring Cobol code.

Benefits:
More free time for development.

PORTSMOUTH, N.H. — A conversion program that imposes structure on spaghetti code has given an insurance company's DP shop here a firm grip on maintenance and a chance to extend the lifespans of some old but good programs.

The DP staff of Liberty Mutual Insurance Co., headquartered in Boston, installed the software in 1984 to solve some problems associated with a group of unstructured Cobol applications.

The firm had instituted a structured methodology and had brought most of its programs into line. Some of its central operations, however, still depended on unstructured applications — programs that performed well despite their unwieldy designs.

"We had identified about 50 real spaghetti programs," systems manager Paul Mooney said. "They ran well in production, but when we had to change them, we had problems."

Mooney said the programs, some written as long ago as 20 years, confused new programmers who had to maintain them. The problem was especially pronounced because Liberty Mutual had lost programmer continuity when it moved its DP operations here from Boston in 1980. Most of the people who had to maintain the firm's code had not

Now you can paint your entire IMS application system.

APS

THE APPLICATION PRODUCTIVITY SYSTEM FOR IMS AND CICS DEVELOPMENT CENTERS

APS, the leader in providing productivity savings to IMS and CICS users, now features exciting new painter technology that makes application prototyping and implementation easier and faster. Using APS, your development staff can:

PAINT screens, reports, data structures and programs in a fraction of the time and cost it currently takes.

PAINT a visual "at-a-glance" representation of an entire application system that shows the relationships of all application components.

PAINT prototypes that clearly demonstrate application systems to end users—from simple screen sequences to full working prototypes that include program logic and data mapping.

LIFE CYCLE SAVINGS

Using APS, your staff can easily extend prototypes into full production systems that support your most complex functional requirements. From your painted source, APS automatically generates native COBOL code including DB/DC syntax and produces comprehensive system documentation. And, during maintenance, your staff can quickly and easily make enhancements at the productive painter level.

So unlike some productivity tools you may have seen, APS won't paint you into a corner. It simply helps you do your job better, and in a fraction of the time and cost.

To learn more about the integrated family of APS products, attend a free APS Seminar. Call us toll-free at 800-638-8703 or just send in the coupon below.

Well-honed management techniques will give boost

Tools, gadgets help, but are not enough

By William W. Marks
and William D. Strowbridge
Special to CW

> ”
> *Technical solutions to productivity problems address symptoms, not fundamental issues. To improve productivity, MIS managers must employ well-defined systems of management.*

Increasing productivity does not depend on tools or gadgets — it's not that easy. True productivity gains come from identifying and developing systems that are critical to a company's business and ensuring that staff activities are directed to this end.

Technical solutions to productivity problems address symptoms, not fundamental issues. The thrust of most productivity tools, for example, is to produce operational code faster, but only a modest portion of systems development is devoted to producing programs.

To improve productivity, MIS managers must employ well-defined systems of management that allow them to direct and control MIS resources.

Once an organization has a system in place, it can bring in productivity tools and do some fine-tuning. Tools are valuable for speeding up the development process, but speed is an asset only if one is headed in the right direction.

A good system of management will let the MIS manager do the following:

- Track requests for services.
- Classify projects.
- Oversee project approval.
- Organize the MIS staff to complete assigned work.
- Report on accomplishments.

Tracking requests. Many organizations allow informal work to filter into MIS, and this is unacceptable. A systems and programming department is like a machine job shop: Both manufacture one-of-a-kind products.

The manager of a well-run machine shop always knows what jobs are to be done and when. An MIS organization requires the same discipline. To gain this control, MIS must have a formal project request procedure.

Classifying projects. Classification establishes a structure that is consistent with resource commitment. Once the structure is in place, it directs how project approval and reporting will proceed.

A structure that works particularly well is one that classifies projects as either discretionary or nondiscretionary.

Nondiscretionary projects are those in which staff members support production systems by solving operational problems or making minor improvements; these activities are part of the cost of having systems. All other projects are discretionary.

Duration is a handy guideline for

Marks is president of Poc-It Management Services, Inc., a Santa Monica, Calif.-based management consulting firm that specializes in information services. Strowbridge is vice-president of MIS for Dataproducts Corp., a printer manufacturer based in Woodland Hills, Calif.

SEARCH® and you will FIND...
...Even faster than Spot!

Spot's friendly and so is SEARCH...
Spot's smart and so is SEARCH...
Spot finds things that are lost and so does SEARCH...
Spot can be your best friend...
...and SEARCH will be your business' best friend

If the system you use makes it difficult to find information, you need SEARCH.

SEARCH is the information retrieval software that provides fast, comprehensive searching and display of all types of textual documents — letters, memos, reports, contracts, proposals — from one page to hundreds of pages.

SEARCH is the only program that lets you store and retrieve information in its natural state — original text. It's easy to use because it stores and retrieves the way you write and think.

Your word processing output can be the input to SEARCH, eliminating the need to index or tag specific parts of your text for retrieval. Every word is stored for searching, even the full text of long, multipage documents.

SEARCH was developed by BRS, one of the largest online systems in the world. Its design reflects the experience of thousands of information professionals performing millions of online searches.

Power...
Flexibility...
Ease of Use.

SEARCH is the ultimate retriever for all your information management needs!

classifying projects. With few exceptions, any project that consumes more than one staff-month of effort is discretionary. MIS managers can benefit further by classifying discretionary projects as either major — requiring more than one staff-year — or intermediate — requiring between one and 12 staff-months — and approaching the two somewhat differently.

In medium-size and large organizations, MIS staffs tend to be more productive if they are divided into two groups: one that handles discretionary projects (software development, for the most part) and another that takes responsibility for nondiscretionary projects (mainly maintenance work).

Managers who so divide their staffs, however, must take special precautions to make work satisfying for maintenance workers who are assigned to nondiscretionary projects (see story SR/45).

Overseeing project approval. Projects must be approved at the proper level:

■ Because nondiscretionary projects usually cost between $5,000 and $6,000 apiece, the approval level for them need not be high.

■ Discretionary projects, both intermediate and major, require approval by users' high-level managers. Intermediate projects generally require the approval of decision-level managers from the users who request the service.

Major projects typically should get approval from an executive committee that includes senior managers from each of a company's user departments. The approval of both major and intermediate discretionary projects should be based on documentation similar to that used for capital appropriation requests.

A good approach is to have users and representatives from MIS prepare a formal document that includes a statement of need, alternatives considered, cost, benefits and recommended approach. The appropriate management group can then use the document to decide whether or not to proceed with the project.

Project approvals are financial decisions, requiring a commitment of resources, and users should be charged for the projects they request. Chargeback focuses management attention on the business value of each request.

Organizing to complete work. Once a project gets the go-ahead, MIS must develop a plan that describes what will be done, who will do it and when it will be completed. The MIS department will also need a tracking process to monitor its progress against the plan. Without formal schedules and tracking, a manager cannot measure performance or determine how productive the staff is.

A formal systems development methodology is important for large systems development. The methodology need not be complex or procedural. It must, however, define project phases and deliverables in enough detail that management and the project team can communicate clearly about activities and status.

Reporting accomplishments. MIS managers should require weekly project reports from their staff members that account for staff time, show progress toward goals and highlight events that are overdue. In addition, MIS managers should provide to the company's executive managers comprehensive monthly documents that report on MIS activities.

To exercise control over MIS project work — the most vital part of a program to improve productivity — executive managers need information about service delivery, resource commitments and progress. MIS should provide monthly reports on all projects; the type of report, however, will depend on a given project's size:

■ For nondiscretionary projects, reporting should focus on the quantity of work and on service delivery. MIS should give executive management statistical reports that show the number of requests received, completed and backlogged; the average duration of projects; and the percentage of jobs completed on schedule.

■ For intermediate systems development, MIS should provide executive management with a monthly report that shows a one- or two-line summary of each project. Intermediate projects are large enough to warrant individual scrutiny, but they require little more than a report of progress and cost against plan.

■ For major projects, monthly reporting should be more detailed, as these projects tend to have the most problems.

A desirable way to tackle large projects is to break them down into phases and report on that basis. If project plans are well structured and task assignments are measurable, MIS management can maintain control and keep users abreast of progress.

Manager's role critical to keeping staff productive

By James Huling
Special to CW

After a recent study by the Public Agenda Foundation of New York, researchers Daniel Yankelovich and John Immerwahr reported that only 23% of American workers were working as hard as they could. The reason, they said, was ineffective management.

MIS managers may argue over the exact percentage of unproductive workers in their industry. They will agree, however, both on the presence of untapped potential and on the premise that management is the greatest single influence on employees' ability to reach their potential.

True gains in productivity can only be accomplished when managers motivate individuals to reach their potential. To motivate a professional staff, MIS managers must recognize — and develop in themselves — those qualities that characterize the truly effective manager. The following are among the most important:

Demandingness and ability to praise. Managers' expectations strongly influence employees' work. If a manager expects less-than-average performance from a particular employee, that employee's productivity will be poor; if the manager's expectations are high, the employee's performance will rise to meet them.

Because managers communicate constantly, both verbally and nonverbally, it is almost impossible for them to mask their expectations. Everything managers say and do serves either to reinforce employees' confidence or to destroy their self-esteem. Effective managers are aware of the influence of expectations and monitor their own expectations to keep them high.

Effective managers also recognize employees' achievements and reward excellence. The reward need not be an increase in salary; MIS professionals show equal or greater response to new technical challenges, increased responsibility, better training and management opportunities. Managers who want to maintain a high level of productivity must understand what rewards motivate a particular employee and must look for opportunities to grant them.

Professional competence. Professional competence for MIS managers embody two skills: management prowess and technical expertise.

■ Management skills are a necessity. Without them, MIS managers cannot effectively organize their staffs' work or use their employees' talents.

Often, MIS managers have been promoted to their positions because of a series of accomplishments as technicians. Although each level of technical work has prepared them for the next level, none provided training for the role of manager. Managers who find themselvs in this position should seek other sources of information and training.

> ”
>
> *True gains in productivity can only be accomplished when managers motivate individuals to reach their potential.*

Individual classes, or the more involved pursuit of a management degree, are ideal. Most universities recognize professionals' needs and offer classes scheduled and paced for people who hold full-time jobs. Organizations like the National Management Association also offer excellent management training that can be conducted at the office.

■ Technical skills are equally important. Without them, MIS managers will have no ability to make intelligent, informed decisions.

Some managers come to MIS with plenty of management skills but little understanding of the technical problems that MIS employees face on the job. MIS managers must make decisions daily on hardware acquisition, software development, systems schedules and other issues. Each decision requires knowledge of different technical subjects.

Managers who lack specific technical knowledge find themselves in a difficult situation; to get out of this position, there are three moves:

■ First, when managers do not understand some aspect of a problem, they should ask for an explanation. Employees will quickly detect any attempt to mask a lack of understanding, and their perceptions will harm the manager's credibility.

■ Second, managers should use

Function Points helps managers assess applications,

By A. J. Albrecht
Special to CW

Almost five years ago, in October 1979, the Function Points productivity measure was presented to Guide and Share, IBM's users groups, and at the IBM Application Development Symposium in Monterey, Calif.

The original objective of the Function Points work was to define a measure for applications development and maintenance functions that avoided the problems inherent in productivity measures in use at that time.

In effect, the measure was intended to help managers analyze applications development and maintenance work and to highlight productivity improvement opportunities.

The original intent of the measure has not changed over the years. As originally designed, the measure will help to focus management attention sharply and objectively on the vastly different levels of applications development productivity being achieved within a DP facility. This is done by establishing a single common measure of an application's I/O products, inquiries, master files and interfaces to other systems.

The method is dependent on the three following elements:

- **The measure must be technology independent.** The measure gives the same number for equivalent applications functions that are based on the external design document regardless of the programming languages or technologies used to deliver the applications.
- **It must measure all the applications functions delivered to the end user.** The measure gives the same number for equivalent applications functions even if large portions of an application were delivered with labor-saving techniques, including the extreme case of avoiding the programming altogether by buying an off-the-shelf application.
- **It must measure only the applications functions delivered.** The measure gives the same number for equivalent applications functions, regardless of the obstacles to productivity, such as a bad development environment, an indecisive application user/owner or inexperienced programmers.

In effect, the Function Points method measures the equivalent functions of end-user applications regardless of the language, technology, technique or development environment used to create the applications. This common measure of applications' functions can then be divided by the amount of time expended on the product to estimate the applications' productivity value.

The productivity value of various similar applications can then be analysed and compared to determine the languages, technologies, techniques and development environments with the greatest effect on productivity. With this information in hand, managers can objectively and systematically change the things under their control to promote higher productivity.

The resulting improvement trends would be demonstrated by tracking the trends with the same measure, namely, Function Points delivered per work month.

The Function Points future

Since that first presentation, a number of conferences and articles and a lot of activity have demonstrated that wide interest in the measure exists both inside and outside of IBM.

Outside IBM, I have participated in over 25 Function Points conferences involving more than 400 companies worldwide. There have been Guide and Share projects to develop the use of Function Points. At least two users groups have been formed to exchange data about Function Points measurements.

Inside IBM, the Function Points idea is evolving into a major measure of applications development and maintenance productivity. For example, a 1984 IBM study of applications development and maintenance productivity reported the following:

- The delivery of 241,000 Function Points for internal IBM use with a work effort of 11,200 work months; an average productivity of 21.5 delivered Function Points per work month.
- The support of 1,115,000 installed Function Points with an annual work effort of 6,200 work months; an average unit work effort of .72 annual maintenance work hours per installed Function Point for internal IBM use.

Futher analysis of this data, and of another set of Function Points data from a cooperative industry study, confirmed that vastly different levels of applications development productivity existed.

The projects reported on by 23 individual IBM sites showed a site-pro-

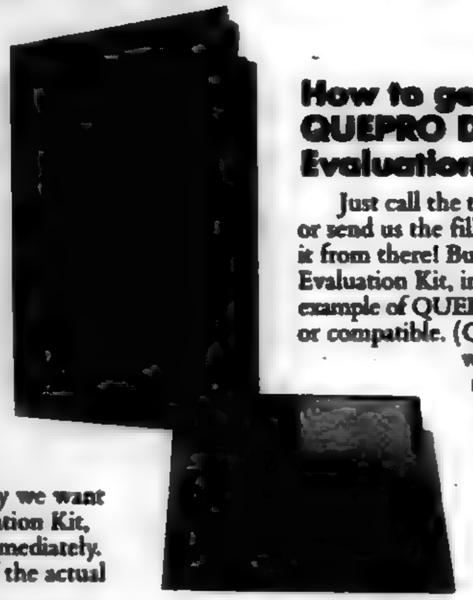
Albrecht is an IBM senior technical staff member based in Purchase, N.Y. He first proposed and defined the Function Points productivity measure in 1979 and has spent a portion of the intervening years in its practical definition and use.

FREE FOR COBOL USERS!
A demo of our revolutionary query processor—QUEPRO.



Now, get the COBOL data you want, when you want it!

How would you like to unlock valuable COBOL data without time-wasting programming?

Or create a comprehensive report in minutes instead of days?

It's easy to do this (and a lot more), *if* you use our powerful, new query processor—QUEPRO.

But talk is cheap, and that's why we want to put a complete QUEPRO Evaluation Kit, including a demo, in your hands immediately. (We're talking about an example of the actual product—*not* a simulation!)

We want to prove that QUEPRO really *can* unlock your valuable COBOL data and put you in complete control!

How QUEPRO works.

It's easy.

Let's say you or someone in your company needs some information. Instead of placing requests with a programmer or DP Manager, holding meetings, and waiting for the product (complete with a bug or two), you can put QUEPRO to work yourself. Instantly.

That's right.

There's no programming. No command language to learn. Nothing between you and the data.

All you have to do is paint the design of your query *interactively* on the screen, choose from two formats—FORM (for screens or pre-printed forms) or LIST (for a list query or report). QUEPRO does the rest.

That means there's no need to define field formats. (Easy to remember synonyms are used to refer to data in your COBOL files.) You'll also find that complex queries involving multifile access and data transfers are a snap with QUEPRO, too!

How to get your free QUEPRO Demo and Evaluation kit.

Just call the toll-free 800 number below, or send us the filled-in coupon. We'll take it from there! But please note. This special Evaluation Kit, including a fully functional example of QUEPRO, requires an IBM-PC® or compatible. (QUEPRO, itself, runs on a wide range of operating systems including all PC-DOS and MS-DOS, Unix, Xenix, CP/-86, IMOS, and IRX.)

Whether you're a potential end-user, computer systems manager, or technical person involved with COBOL, you owe it to yourself to get in touch and take a look at QUEPRO for yourself.

There's no cost or obligation of any kind. Why not call right now?

Call toll-free 800-631-2229
or 415-527-1157.

bytelcorporation
1029 Solano Avenue, Berkeley, CA 94706, (415) 527-1157

Rush me a QUEPRO Demo and Evaluation Kit absolutely FREE! I am under no obligation of any kind. I understand that the demo runs only on an IBM-PC® or compatible, though the actual QUEPRO product runs on a variety of operating systems.

COBOL used (please check): ☐ RM/COBOL ☐ MicroSoft ☐ Microfocus ☐ Other

maintenance values

ductivity range from 11 to 65 Function Points delivered per work month.

The cooperative industry study, coordinated by J. Edward Kunkler of Xerox Corp., reported that 19 companies averaged a productivity range of four to 65 Function Points per work month. Since these are site and/or company averages, the individual projects vary over an even wider range.

There are valid reasons for this wide range of productivity ratings as follows:

- Generally, sites near the top of the scale are installing a high percentage of applications acquired from other sites.
- These sites are also using high-productivity tools on applications well suited to the tools.
- In the middle of the productivity curve are those sites that use a broad mix of techniques and whose projects range from small to large.
- Near the bottom are sites that have central development responsibility for large applications supporting many diverse users.

The productivity of each of these levels is, in turn, influenced by the effectiveness of the project management, the maturity of the applications users and owners and the training and experience of the project personnel with the languages, technologies and techniques being used.

Improvement possibilities

Clearly, there are significant improvement possibilities to be considered when weighing the results of these studies.

More precise statements about the attributes associated with the levels of this productivity spectrum must be developed.

Companies could analyze these attributes and identify those that might offer potential productivity improvements.

Further, those attributes that affect productivity significantly could be considered when designing a project.

Management concerns

The frequent management response to this wide range of productivity results is a request for additional adjustments to the Function Points measure. Managers often ask that normalization factors be added to neutralize the effects of productivity obstacles that are outside of their control or responsibility. Their arguments include the following:

- Since they are not responsible for the work lost by an indecisive applications owner, they should be allowed to include the rework in the output product.
- Programmer inexperience is a result of departmental turnover, and there should be an adjustment to neutralize the effect of inexperience.
- They did not select the programming language; they are stuck with it.

The inescapable problem with making such adjustments is that the resulting measure does not portray the real output product. Two consequences can result, both of them bad in the long term:

- Management's view of the obstacles to productivity can become blurred. Instead of a sharp and objective focus on the true cost of low productivity, the effects of the obstacles to productivity are masked. Obstacles are much more likely to be identified, analyzed and overcome if their true effects on productivity are measured and portrayed.
- The ability to track and portray improvement trends is lost.

For these reasons IBM is continuing its Function Points measurement work with its original objectives: to be technologically independent; to measure all the applications functions delivered to the end user; and to measure only the applications functions delivered to the end user.

Programming with ease

...for PC applications

Why struggle with programming your PC when you can let your creativity reach new heights by using the Micro Focus* integrated programming environment. Micro Focus Professional COBOL* converts an IBM* PC into a programmer's work-station containing all the tools you need for serious development of PC applications. These state-of-the-art development and debugging tools are closely integrated to combine great power with ease of use.

Professional COBOL uses the Micro Focus High Performance Level II COBOL* compiler certified by the GSA at High Level ANSI '74 with zero errors. And the integrated environment lets you switch between the Syntax Checker and the Editor, to correct each error as it occurs, then go to Animator* to debug by watching the source code executing then to Compile, Run, Library and Build. Easy to use screens in full color can be added to your program by simply entering our Forms* generator while editing.

If you'd like to hear from someone who's actually experienced Professional COBOL and the ease of use we're talking about then how about this extract from PC World's July COBOL review written by Marilyn Z. Smith, "*Winners Circle. I found it hard to dislike Professional COBOL. It is clearly the best of the compilers evaluated. It also takes into account the wear and tear most COBOL programmers experience . . .*" Professional COBOL ranked first both in this and in a series of reviews finalized in the August issue of PC Tech Journal.

For Fourth Generation language buffs our Sourcewriter product can help you quickly build finished systems. It uses a data-dictionary plus screen painting and file linking techniques to allow rapid development of prototypes and complete database applications. And because it generates standard Level II COBOL you can use the power of Professional COBOL to add the same richness and complexity as hand-coded solutions.

If your applications have a mathematical turn of mind then CO-MATH will help you by providing a library of mathematical functions. And then there is CO-GRAPHICS which provides the COBOL application programmer with a full graphics capability to the Graphics Software Systems Inc VDI standard.

If you want to port the applications you develop on the PC to the Apple Macintosh* use our Mac COBOL* which contains the same Level II COBOL compiler as Professional COBOL.

To find out more about our products and for copies of the review articles mentioned above just call or write.

...building applications better

Fourth-generation languages prompt productivity boost

By Pieter Mimno
Special to CW

The rapid proliferation of computers to a wide variety of end users has caused a serious productivity crisis. The demand for new applications is clearly outstripping the ability of professional programmers to supply these applications using conventional development techniques.

In many organizations, the imbalance between demand and supply has resulted in a growing application backlog, increased end-user frustration and a deterioration in the support provided to the organization by information services. New, much more powerful development techniques, accessible to end users, are required to solve the productivity crisis.

One significant trend that developed recently addresses the productivity needs of both end users and professional DP personnel. This trend is the growing movement away from the use of inefficient, manually oriented third-generation programming tools such as Fortran, Cobol and PL/I and toward much more productive, automated fourth-generation language tools.

This new technology enables organizations to use computers and information more effectively and to obtain major increases in development productivity. These products sidestep the process of hand coding applications.

The programming of applications one line at a time using third-generation, hand-coding techniques is a hopelessly inefficient process that must be replaced by more automated techniques. Few organizations can afford the expense, low productivity and unreliability of hand-coded applications.

Hand-coding techniques are incapable of coping with the avalanche of new applications that are already overwhelming data processing centers. In his book, *Application Development Without Programming* (Prentice-Hall, Inc., 1982), James Martin estimates that the number of applications per data processing center is growing at a rate of 45% per year. Over a 10-year period, this rate of growth will result in 40 times as many applications as we now have.

Most development centers currently need a productivity improvement of 10:1 to cope with the rapidly growing backlog of new and pending applications. Over the next 10 years, productivity in the applications development process must increase by a factor of 100.

> ”
>
> *Organizations that have made a commitment to fourth-generation languages . . . have found they can develop applications much faster.*

In order to achieve major improvements in development productivity, it is necessary to do the following:

- Eliminate hand coding.
- Use automated applications development-tools.
- Provide end users with automated tools that enable them to access and process information directly to solve business problems.
- Use new prototyping and development methodologies that are tied to automation.

Automated fourth-generation languages have progressed to the point that they can be used to replace Cobol and Fortran for all but the most complex or time-critical applications.

These languages provide a wide range of integrated functions, includ-

What IBM can't tell you about MVS, CICS, & VM.

Marketing clouds language issues

By Roy Bengen
and Nicholas Zvegintzov
Special to CW

Fourth-generation languages are a marketing skin wrapped around a mix of products. The aim of the vendors is to persuade data processing professionals to buy everything that the vendors have to sell — everything inside the marketing skin. The aim of DP professionals is to buy only what they need.

The "language" in fourth-generation language strictly refers to query and report-generating tools, but vendors want DP customers to think that when they buy the language, they buy all the tools the vendors have in the closet. Some of the tools in the closet are useful and needed. These include the following:

- Tools for specifying the most visible functions of a data processing system — reports, inquiries, screen formats, graphics and so on.
- The building blocks of a data processing system — data base, data dictionary, communications, development support tools and the like.
- Applications packages — payroll, accounting, manufacturing support and others.

The challenge for DP professionals is to do the following:

- Buy tools that they need.
- Buy the tools at the time that they need them.
- Fit the tools to the systems and people that the professionals already have.
- Not lock themselves into proprietary straitjackets.

Fourth-generation language products can be bought separately when a customer persists. Try out a vendor by asking for something specific. If the system is so general that it will match every need, but not specific enough to match your shop, avoid it.

The fourth-generation language marketing approach is designed to convince DP management that they need an entirely new system for creating applications and that they need to replace everything in their shop with it. Some of the arguments promoting fourth-generation languages make the following claims:

- Most shops have an application backlog.
- There are not enough programmers.
- Users should do their own programming.
- Systems must be integrated.
- Most DP systems are old and worn out, and, therefore, fourth-generation languages are needed.

This approach lacks substance for the following reasons:

- Backlog is not the central issue in most shops. Users always want more than they can get, but that is human nature.
- Programmers are in fairly good supply; in fact, there is a surplus of entry-level programmers.
- Users do not want to do their own programming. If they did, they would be in data processing.
- Integrated systems are not essential, and they bring their own problems. The more integrated the system, the more difficult to adapt to existing constraints and the harder to maintain.
- Most currently installed systems are old but not worn out. Most systems managers would like to keep the old systems and build new features on top.

Given these weaknesses, the future of the fourth-generation language marketing approach is dim.

The fourth-generation shakeout

DP professionals should also note that within the fourth-generation marketplace there has been a ferocious shakeout. Most fourth-generation language start-ups have faded away, and there is heavy competition among the larger and older vendors.

Martin Marietta Data Systems now owns both Ramis II by purchase of Mathematica Products Group, Inc.

New breakthroughs in software technology for IBM MVS and VM.

Hundreds of installations are increasing their performance and productivity by using PIE, the Productivity Integrated Environment.

The PIE family of software products provides a totally new technology for multiple concurrent host sessions for MVS, TSO,CICS, and VM users.

MVS

PIE/TSO allows you to switch between up to 12 parallel sessions instantly without starting or stopping applications (or logging on or off) —from a single TSO terminal using only one TSO ID.

- Switch between any combination of TSO, ISPF, CICS, IMS, IDMS, SAS, FOCUS, RMF, OMEGAMON, INFO/ SYS, SDSF, CMS, NCCF, UCC-7, DISOSS, PROFS, ROSCOE, TELON, or any VTAM or TCAM application.

For example, you can have 2 ISPF's, 3 CICS's, and 2 IMS's running concurrently on the same or different CPUs.

- PIE removes 90% of TSO non-trivial transactions overhead.
- Create Dataset Menus that allow you to BROWSE, EDIT, DELETE, PRINT, etc. any dataset without ever typing a dataset name again. Menus (including comments) are saved across logons.

CICS

PIE/CICS allows you to switch between up to 12 parallel sessions instantly from a single CICS terminal by just pressing a PF Key.

- Switch between any combination of CICS, IMS, TSO, ROSCOE, DISOSS, PROFS, ICCF, CONDOR, ISPF, CMS, SDSF, SAS, FOCUS, or any other VTAM or TCAM application.

For example, you can have 3 CICS's and 2 IMS's running concurrently on the same or different CPUs.

- Go back and forth between multiple CICS transactions from the same or different CICS by just pressing a PF Key.
- Create Application Menus by user or group of users.

VM

PIE/VM allows you to switch between up to 12 parallel sessions instantly from one VM terminal just by pressing a single PF Key.

- Switch between any combination of CMS, ISPF, CICS, IMS, IDMS, DISOSS, PROFS, TSO, PVM (Passthru), UCC-7, SAS, FOCUS, SMART, OMEGAMON, INFO/SYS, MVS Consoles or any VTAM or TCAM application.

For example, you can have CMS, MVS/CICS, DOS/CICS, and VS1/CICS running concurrently on the same or different CPUs.

- Create Application Menus by user or group of users with Automatic Logon to your applications. A Status Menu shows all your active sessions.
- Full Protocol Conversion allows any Personal Computer or ASCII terminal to interface to all applications as a 327x terminal.

All PIE products interface and enhance your present Security system (such as RACF, ACF2, TOP SECRET). You can manually lock your terminal so no one else can use it or have it lock automatically if you walk away from it for a few minutes.

In addition, you can pass screens to any user or group of users and save them to disk for later replay (slideshow), documentation, education, or troubleshooting.Call or write today ... for a complete data kit on PIE and learn how fast you can start benefiting from this breakthrough in technology.

"Justifying PIE was trivial. It made such an positive impact on the entire datacenter in one week that no one would give it up."

Announcing Version 5

Subsecond TSO response times cultivate productivity

SYRACUSE, N.Y. — By a conservative estimate, a large farm cooperative here has gotten between 53 and 55 programmers' worth of work out of its 50 programmers since it installed applications development hardware and software in June 1984.

The estimate is that of Dennis LaHood, director of systems development for Agway, Inc. And the numbers bear him out: Agway's IBM TSO transactions have increased from approximately 55,000 to approximately 75,000 per day, and the firm has not added to its programming staff.

Agway, a $4 billion concern owned by 104,000 farmers in 12 Northeastern states, oversees farm supplies and food marketing for its members. LaHood's staff develops between 300 and 400 programs a year and maintains a stock of software that handles corporatewide and divisional data.

The cooperative brought in its application development aids last year shortly after it upgraded from two 8M-byte IBM 370/158s to two 12M-byte 3033s — one for development and one for production — in an attempt to end a response time problem that had stalled programmers' work.

Before it upgraded the mainframes, Agway logged an average response time of 6 seconds for trivial TSO transactions on its development mainframe. The upgrade brought the average lag down to between 2¼ and 3 seconds and let Agway process 65% of its trivial transactions in less than 1 second. It left room for improvement, however, according to Andy Catts, the firm's manager of technical assistance.

AGWAY

"When we upgraded the CPUs, we had to ask if the new IBM gear solved everything for us," Catts said. "The answer was obviously no." Agway still had two issues to address: consistent reponse time and individual productivity.

Consistent response time. Although response times dropped after Agway installed the IBM equipment, they were still inconsistent: They varied according to the number of other demands on the mainframes.

Individual productivity. Programmers still had to wait for the mainframe to process nontrivial transactions. Their keyboards froze, and the programmers could work on nothing else.

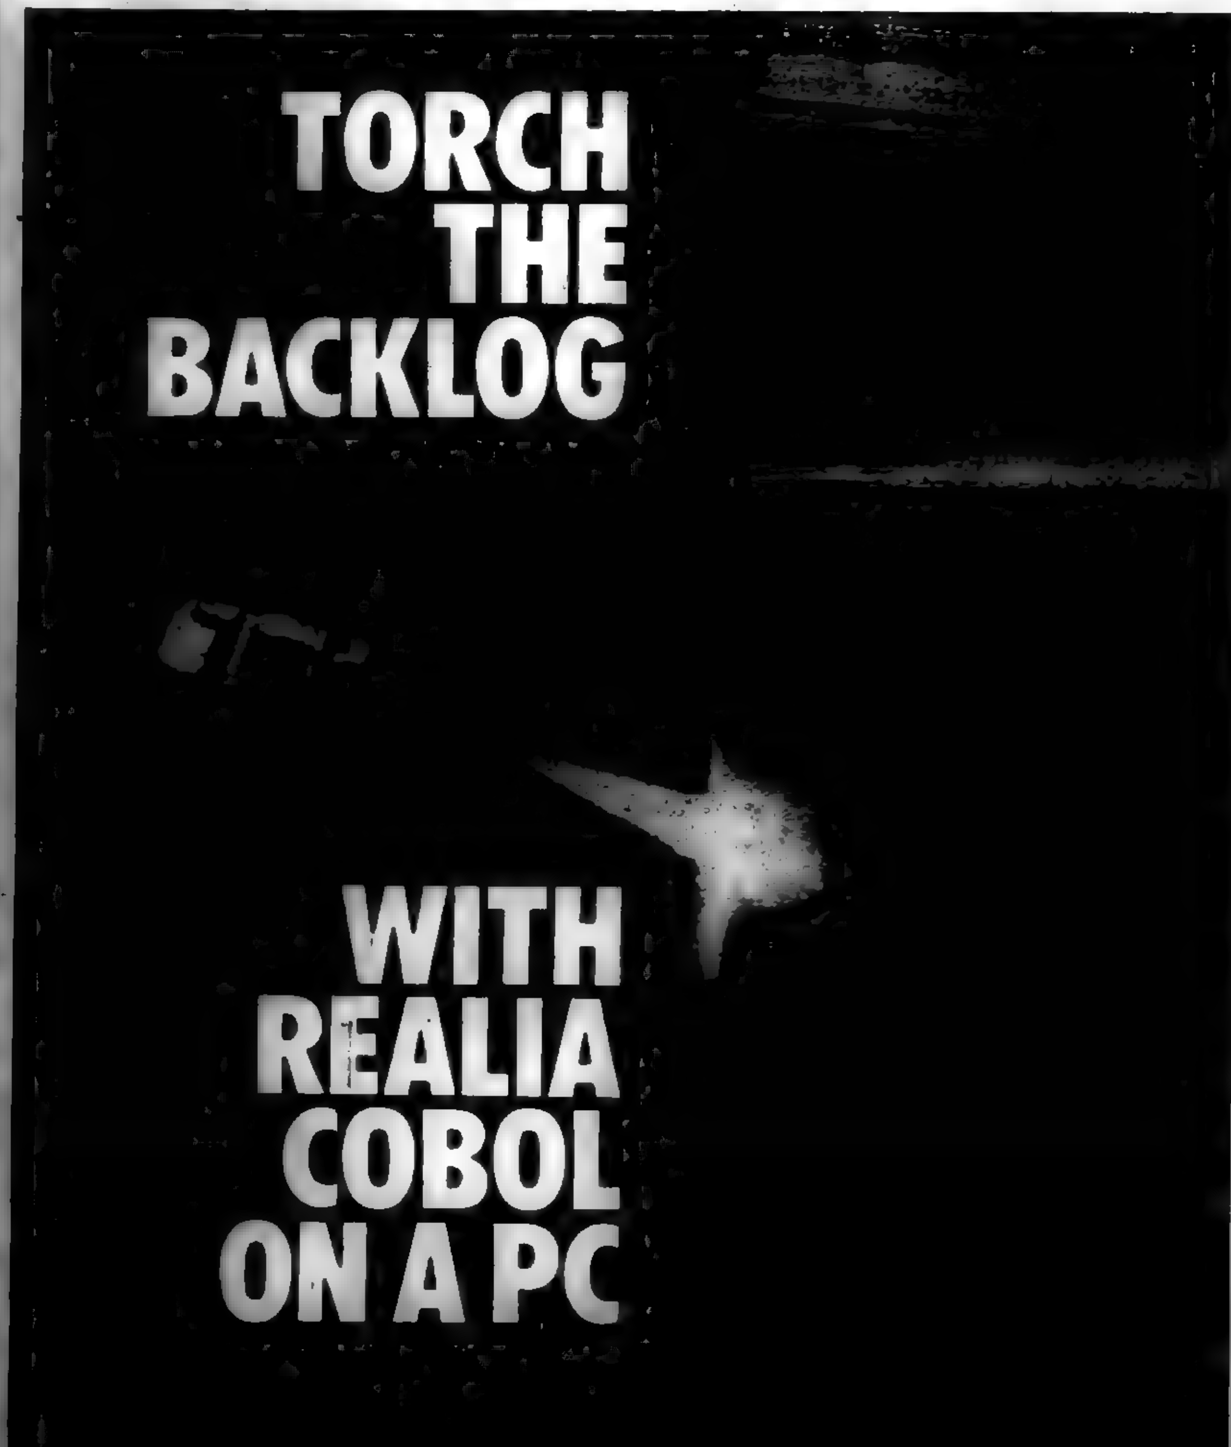
First commercial user

Agway agreed to serve as the first commercial user for an integrated applications development system (see story SR/27). The system, Dialogic/One from Dialogic Systems Corp., consists of a parallel processor, made up of four Motorola, Inc. 86010 chips, that runs program development application software and a series of editors. The hardware sits physically and functionally between programmers' terminals and their host mainframe, which runs software that enables communications (see chart).

Since it began using the system, Agway has consistently off-loaded approximately 40% of its total TSO transactions from the mainframe to the parallel processor, according to LaHood. Overall programmer transactions have increased by approximately 26%, but the number being run on the mainframe has dropped by approximately 20%.

The setup has resulted in average response time of less than 1 second, LaHood said. He calculated that the decreased response time accounted for an increase of at least 5% in programmer productivity, based on a study in "The IBM Systems Journal" that related the two factors.

Because developers have access to their own processor, their response times no longer vary according to other users' demands on mainframe resources; the processor ensures consistent response times regardless of



in farm co-op's DP shop

other users' patterns of consumption. LaHood said the setup also shields development from the inevitable rise in demand for mainframe power and the performance degradation that accompanies it.

The Dialogic/One's software components, especially programs that give developers split-screen and Cobol editing capabilities, have also contributed to improvements in productivity, especially for individual programmers.

The split-screen capability allows a programmer to perform up to four concurrent tasks. While the programmer waits for one transaction to run, he can work on another one.

Catts said the advantages of this approach over traditional TSO processing have impressed Agway's programmers.

"In the standard TSO environment, you can only perform one task at a time," he explained. "With the Dialogic system, a programmer can sit down at a terminal, split the screen up and do multiple tasks concurrently. It's been great for the productivity of the application development group here."

LaHood said the system's Cobol editor, which allows programmers to check and edit their syntax before they compile a program on the mainframe, has also contributed to improvements in productivity. Without the editor, Agway's programmers had compiled their programs an average of three times before they cleaned up errors in syntax; with the editor, they compile programs just once, on the average.

Besides freeing programmers from the chore of recompiling their work, the editor has allowed Agway to cut costs by reducing the amount of expensive mainframe time devoted to compiling code, according to LaHood. He said logic errors still hamper development, but he knows of no quick solution to that problem.

informatics general corporation

application development report: MARK V

MARK V® HELPS AIRCRAFT MANUFACTURER ENTER ONLINE PROGRAM DEVELOPMENT WORLD

Use of MARK V at Beech Aircraft Corporation has not only increased the productivity of the firm's programmers and analysts — it has given them a whole new capability for online program development.

Prior to acquisition of MARK V, an Implementation System from Informatics General Corporation for generating online applications, Beech had largely limited itself to purchasing ready-made packages for its online systems. "Until we acquired MARK V, greater levels of technical expertise and manpower were required to develop online systems," explained Craig Young, MARK V Coordinator in the Beech Computer Services Department.

"We're an IMS/DC shop, and in this environment a COBOL programmer has to be thoroughly versed in IMS and DL/I in order to write online programs," he added. "We're talking about months and months before you develop enough expertise to be productive. But a programmer using MARK V doesn't have to learn IMS or DL/I, and this shortens the learning curve tremendously. We can take recent hires, or people who for one reason or another have not been involved with IMS, and almost immediately put them to work developing online systems."

Beech, a leading manufacturer of business and commuter aircraft, employs about 40 programmers and analysts, nearly three-quarters of whom have learned to use MARK V, Young noted. Total employee count for the firm is approximately 7,500. The company uses an IBM 3084 mainframe, running under the OS/VS MVS operating system.

Their pilot MARK V project — the first online system ever developed by the firm in-house, Young noted — was an interactive Industrial Relations System linking the functions of Personnel and Payroll with a common online data base.

This system allows Personnel to load information on new hires into the data base from their online terminals, with control of employee data being automatically transferred to the Payroll Department after employment begins.

Coding for the Industrial Relations System was performed by two Beech programmers who attended the MARK V training class but had no prior experience in data communications or online system development.

In addition to MARK V, Beech also uses MARK IV®, an Informatics Implementation System for generation of batch application, and SHRINK, an Informatics data compression system.

"The online data base for the Industrial Relations System has to interface with our existing batch payroll system," Young explained. "To facilitate this we're using MARK IV on the front end, to load the online data base from the existing batch personnel files — and we're also using MARK IV to read the online data base and update existing personnel files that are used in writing paychecks. In effect, we've got MARK V in the middle and MARK IV on both sides of it."

Beech has implemented a number of additional online systems since completion of the pilot Industrial Relations System, Young pointed out. "MARK V has made us a lot more responsive to user requests than we used to be," he noted. "For example, we recently put up an online Telemarketing System for our marketing people that has met with enthusiastic approval from the users."

"We had not had a Telemarketing System in the company before, and when we began developing this online system the user was making his best guess at what he wanted, but really wasn't sure," Young explained. "Here, the flexibility MARK V provides in prototyping a system really came to our rescue. It was a tremendous asset to be able to quickly change or add the things the user wanted."

Other online systems recently developed using MARK V include:

- An Inventory Management System used by Procurement to maintain information on manufacturing inventory. This system was originally purchased from an outside vendor, and was written in COBOL; Beech programmers have added a number of sections and screens to it using MARK V.
- A Production Inventory Control pick list system.
- A Tool Control System to track location of tools.
- A Quality Assurance System that keeps track of periodic calibration of tools and certification of personnel as required by FAA.
- A system to cross-reference vendor part numbers with the company's in-house material code numbers.
- A report distribution control system for the Computer Services Department.
- A system to track reliability of target missiles manufactured by Beech for the military services.

"There's a lot of enthusiasm among our programmers to use MARK V," he said, "because it's a way for them to get into the world of interactive programming quickly, without having to learn all the ins and outs of IMS data communications. They consider it a real break from the humdrum of batch systems, to be able to work on an online application."

"The advantages to the company of having information available online are obvious — and now that we know how easy it is to get an online system up, we're much more inclined to look at writing an application in MARK V and putting it online," he added.

I would like to see how the MARK Series can help me with my CICS, IMS/DC and batch programming.

The future of prototyping as a user-friendly DP strategy

By Bernard H. Boar
Special to CW

In the past year there has been a tremendous growth and acceptance of prototyping as a requirements definition strategy. This is not at all a surprising fact, as more and more corporations have realized that alternative definition techniques are feasible with integrated fourth-generation software.

Many data processing professionals are interested in learning how they can successfully implement prototyping as well as learning what the future of prototyping will hold.

Predicting the long-range future of prototyping is simple if its future is viewed as part of the natural trend toward friendly, more user-oriented data processing approaches.

The future

What, however, will happen with prototyping during the next few years?

When I gaze into my crystal ball to see the future, I see the following:

Controversy. As is the case with most new ideas and techniques, controversy will surround prototyping. Conservatism, vested interests and skepticism will all contribute to the debate. Many users will be hesitant to experiment fearing that "the leading edge is the bleeding edge."

Though concern is understandable and prudent, the controversy will eventually give way to enthusiasm for this approach.

After all, nothing is radical about an approach that promotes the following:

- Interacting with the users.
- Quickly building a model solution.
- Demonstrating the solution.
- Refining the model based on the user reaction.

> ”
>
> *Predicting the future of prototyping is simple if it is viewed as part of the natural trend toward user-oriented DP approaches*

In the long run, nothing can remain controversial about such a simple, yet elegant, approach to solving the communication problem and finally enabling meaningful user participation.

Every consultant will be a prototyping expert. As the interest and market for prototyping grows, so will the consultant bandwagon of products and services. The information center, data base management system and structured techniques all created huge consulting industries.

There is nothing wrong with this, and, to the contrary, the availability of qualified consulting support can expedite the introduction of prototyping.

Prospective clients, however, should be selective when they go about hiring a consultant.

Prototyping products. Today actual prototyping tools cannot be bought. Rather, one buys a superior product to support conventional development that can be used to support rapid prototyping.

As the prototyping discipline develops, specific prototyping products will be developed.

Such products will be designed around a central integrated dictionary and will optimize the productivity/flexibility of the prototype without regard to production system constraints. The influx of this technology will be especially evident in the personal computer world as multiuser systems with shared data bases become available.

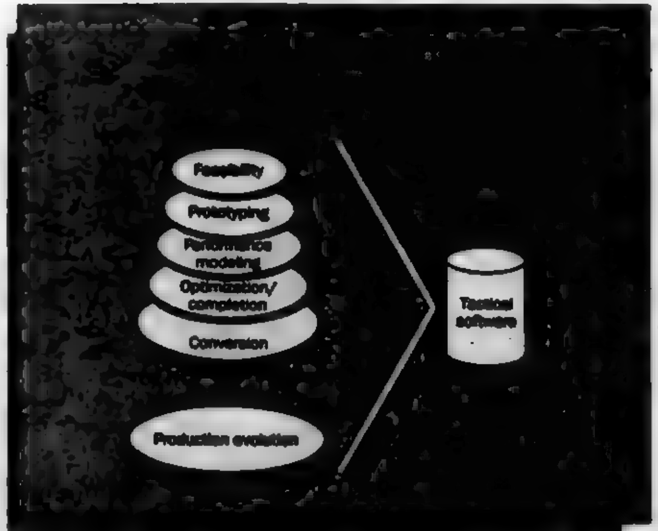

Figure 1. Prototyping is a key stage in fourth-generation development.

Prototyping will displace prespecification. By the early 1990s prototyping will be

Prototyping system halves insurance firm's backlog

MILWAUKEE — An insurance firm here cut its backlog in half and brought up a valuable strategic system after it switched from a standard development methodology to one based on prototyping.

Before June 1983, when Capitol Bankers Life Insurance Co. installed a fourth-generation applications development system, the firm did most of its programming in Cobol. Capitol Bankers had grown 225% annually for three years, and programmers could not keep pace using a third-generation language. They faced a six- to eight-month backlog.

Today the firm has a three-month backlog, according to DP manager Dan Johnson, and much of the time lag has resulted from increased demand rather than from development problems in the DP shop.

Capitol Bankers Life

"By dramatically reducing our application development backlog, we have found that we can go back to our users and tell them that they can have more features, instead of fewer," Johnson said. "This made our data processing department very popular."

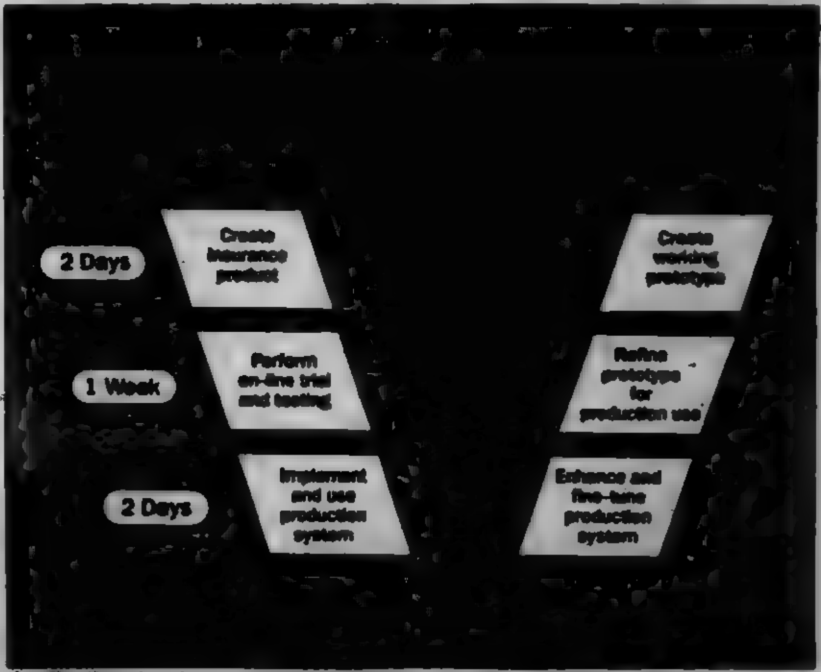
Johnson's staff works with users to design prototypes with Rexcom, a fourth-generation language and relational data base management system (DBMS) from Rexcom Systems Corp. The software runs on two 6M-byte Prime Computer, Inc. 9950s linked in a ring network.

Working with the users

At the start of any development project, programmers meet with users to define basic functional requirements. When these are set, the programmers build interface screens and data bases with Rexcom. They add some simple edits and data manipulations and release the prototype. Users then work with the prototype system, entering test data and generating reports.

Next, the programmers build the system into a production application. At this stage, they add edits and tie in Fortran or Cobol subroutines that can handle heavy calculations better than the fourth-generation language can. When they finish, they release the production system to the users.

For typical applications, those that support new insurance policy types, development takes two weeks from planning to implementation, according to Systems Analyst Tom Ehlen. When Capitol Bankers programmed in Cobol, the development cycle consumed two months or more.



2 Days
Create insurance product
1 Week
Perform on-line trial and testing
2 Days
Implement and use production system
Create working prototype
Refine prototype for production use
Enhance and fine-tune production system

Application development normally takes about two weeks.

Johnson said the prototyping life cycle gives his shop an edge over organizations that use traditional techniques. "In many DP shops I know of, it takes six months before a new application even enters the development queue," he said. "Here, we are able to sit down with the users, sketch out their functional requirements and present them with a prototype system in just a few days."

Capitol Bankers has taken advantage of its development tools to create new policy applications, ad hoc reports and strategic systems, most notably an application that allows independent insurance agents in the field to enter policy data to the Prime hosts on-line and print out policies in their offices.

Field agents use a variety of terminals and microcomputers to dial into the hosts via Tymnet, Inc.'s Tymnet. As agents enter policy data, Rexcom applications capture, edit and validate the information. Cobol and Fortran routines then access the data in batch mode.

These routines calculate clients' insurance premiums. Within 20 to 30 minutes, agents can print out a client's policy record.

Do you still think automatic configuration management is "pie in the sky"?

Think again.
It's here. Now. Proven.
Deliverable today!

With Softool's Change and Configuration Control (CCC™) tool, you will be in charge.

CCC Automates:
• management of changes and configurations • control over who makes what type of changes and where • tracking of trouble reports • reconstruction of previous versions • document control • management reports • archiving • and, much more.

CCC is Interactive And Friendly.
It supports all programming languages, and comes with on-line tutorials.

CCC is a Proven Product.
Over 1,000 Softool products are installed worldwide. CCC is supported on the Apollo, DEC VAX, DG MV, Gould S.E.L., Honeywell 6000 series (Level 66, DPS 8/88), HP 9000, IBM 370, 30XX & 43XX, and Sun computers.

CCC is the Solution for the 80's.
It resolves the most important problem facing the software industry today: configuration management. CCC offers true configuration control. . .where all components of a given release can be managed as a unit.

There is More.
CCC is a stand-alone component of Softool. An integrated Programming Environment (PE™) is also available.

Call today for more details or a hands-on demonstration.

Proven in MIL-STD Applications!

DOS/VSE and CICS/VS Frustration?

BIM gets it out of your system.

BIM presents a line of proven programs that maximize your system's capabilities, saving you time, labor and expense. These program products help get the most out of your system and people.

BIM-EDIT — the editor with more than 25 significant features that ICCF can't match.
BIMSPOOL — Prints output in POWER/VSE spooling queue on local or remote 3270 terminal printers. (Received ICP Million Dollar Award 1985).
BIMSPOON — On-Line to Batch Print Spooling. Prints data passed from CICS application programs into the POWER spooling queue.
BIM-PDQ — POWER Dynamic Queuing performance enhancement. Eliminates 85% of the I/O to heavily used POWER queue.
BIM-ODS — Comprehensive problem analysis and display of operational CICS system. DOS and OS.
BIMTEXT — Word processing, document composition system. Create formatted documents from free-form input.
BIMWINDOW — Multiple terminal sessions concurrently at CRT under DOS or OS VTAM.
BIMSWAP — Switch local 3270 BTAM terminals between multiple CICS partitions without special hardware or additional ports.
BIMCMPRS — CICS 3270 data compression system. Reduces response time for remote terminals significantly. Available for OS/VS1 and MVS also.
BIMECHO — Copies one CRT's output to another or printer for problem determination and demonstration.
BIMP3270 — Comprehensive CRT screen image print facility. Copy to terminal printers or spool queue for system printer.
BIMSERV — On-line display of library directories and entries, VSAM Catalog entries, disk VTOC's, etc.
BIMCNSOL — Multiple/Remote System Console function for CICS. Display-only or full input/display versions available.
BIMMONTR — DOS/VSE System Status, Performance Measurement, and POWER Queue display.
BIMSUBMT — On-line Job Edit and Submission facility.

BIM programs are cost-efficient, many less than $900, highest $4000. You can save even more with our group package offerings. Products are available on permanent, annual, or monthly licenses, and shipped on a 30-day free trial basis. Product documentation is available on request.

BIM also performs systems programming consulting, with consultants based in Minneapolis and Washington, D.C. Computer time services are also available on our 4331-2 system, on-site or remote.

Fourth-generation languages: What they are and are not

By Arnold Leak
Special to CW

Fourth-generation language is a term that has been applied somewhat ambiguously to a number of productivity tools. The ambiguity inherent in the definition is characteristic of the differences found within the set of productivity aids being sold as fourth-generation languages today.

The fourth-generation term was coined to describe tools that were designed to be more productive than third-generation languages for creating applications.

One common objective of fourth-generation languages is to eliminate programmers from the software creation cycle.

Programmerless development

The systems analyst can use the new products to generate prototype programs quickly to show the user. This process is completed without detailed hand coding by a third party; it is in essence, programmerless software development.

To be defined as a fourth-generation language, a product must have the following features: nonprocedural operation (does not require a programmer); natural language (English-like) keywords; links to a centralized data base and data dictionary; efficient code creation; and the capability of creating applications in one-tenth the time (or less) required to hand code Cobol.

The speed of applications creation and the absence of procedural code enable prototyping to be done by nonprogrammers.

Fourth-generation languages must be differentiated from other software with which users or systems analysts can create applications. Products that can be grouped into the non-fourth-generation-language category include query languages, report generators, graphics languages, applications generators, high-level programming languages and parameterized application packages.

Leak is vice-president of technology for Commercial Systems Laboratories, Inc. in Auburn, Ala.

GAINS

from SR/19

each such instance as an opportunity to increase their understanding.

They will soon learn which employees are willing to share their knowledge and which are most skilled at explaining technical issues.

■ Third, MIS managers who lack technical expertise can find help outside their shops. There are excellent textbooks and university classes directed toward managers who have little or no technical background.

Managers who have both management and technical skills will be able to lead employees to reach their full potential as effective, productive professionals.

Concern for individuals. Effective MIS managers are concerned with their employees as individuals. They respect their differences and attempt to provide the environment most conducive to each one's productivity. Managers must recognize, for example, that some people work best when they have considerable freedom, while others need structure and guidance.

Recognizing and understanding employees' perceptions of their roles in the organization are also critical. Conflicts arise when employees sees themselves differently from the way their manager sees them. To reconcile the two perspectives, managers must talk and listen.

Most MIS professionals have definite feelings about their needs and their roles, and they will discuss these with the manager who has learned to listen.

From J.D. Edwards & Company, the industry specialist for IBM System/36 and System/38 computers, comes award-winning software.

A Paragon of Technology

Data dictionary driven...100% soft coded...normalized database...clone generated...superbly documented...with impeccable code. This sophisticated software is easily modified and notably advanced.

Large Scale Integration

Here's cross-organization integration on an unparalleled scale. General business, inventory, billing, financial and cost accounting interact with elegant simplicity. Security is enhanced providing much-needed controls.

Unsurpassed Documentation

Imagine the ideal in documentation...then see it at work with this exceptional system. Access information on-line or print as required. Develop video flowcharts, utilize the dynamic cross reference search. Data field help and where used facility is also at your fingertips.

Expanded Security

This sophisticated system begins with solid IBM security and goes several steps further with simple-to-implement tools. Choose the features that best benefit your business: menu masking...program function lock-outs...cost center and location security.

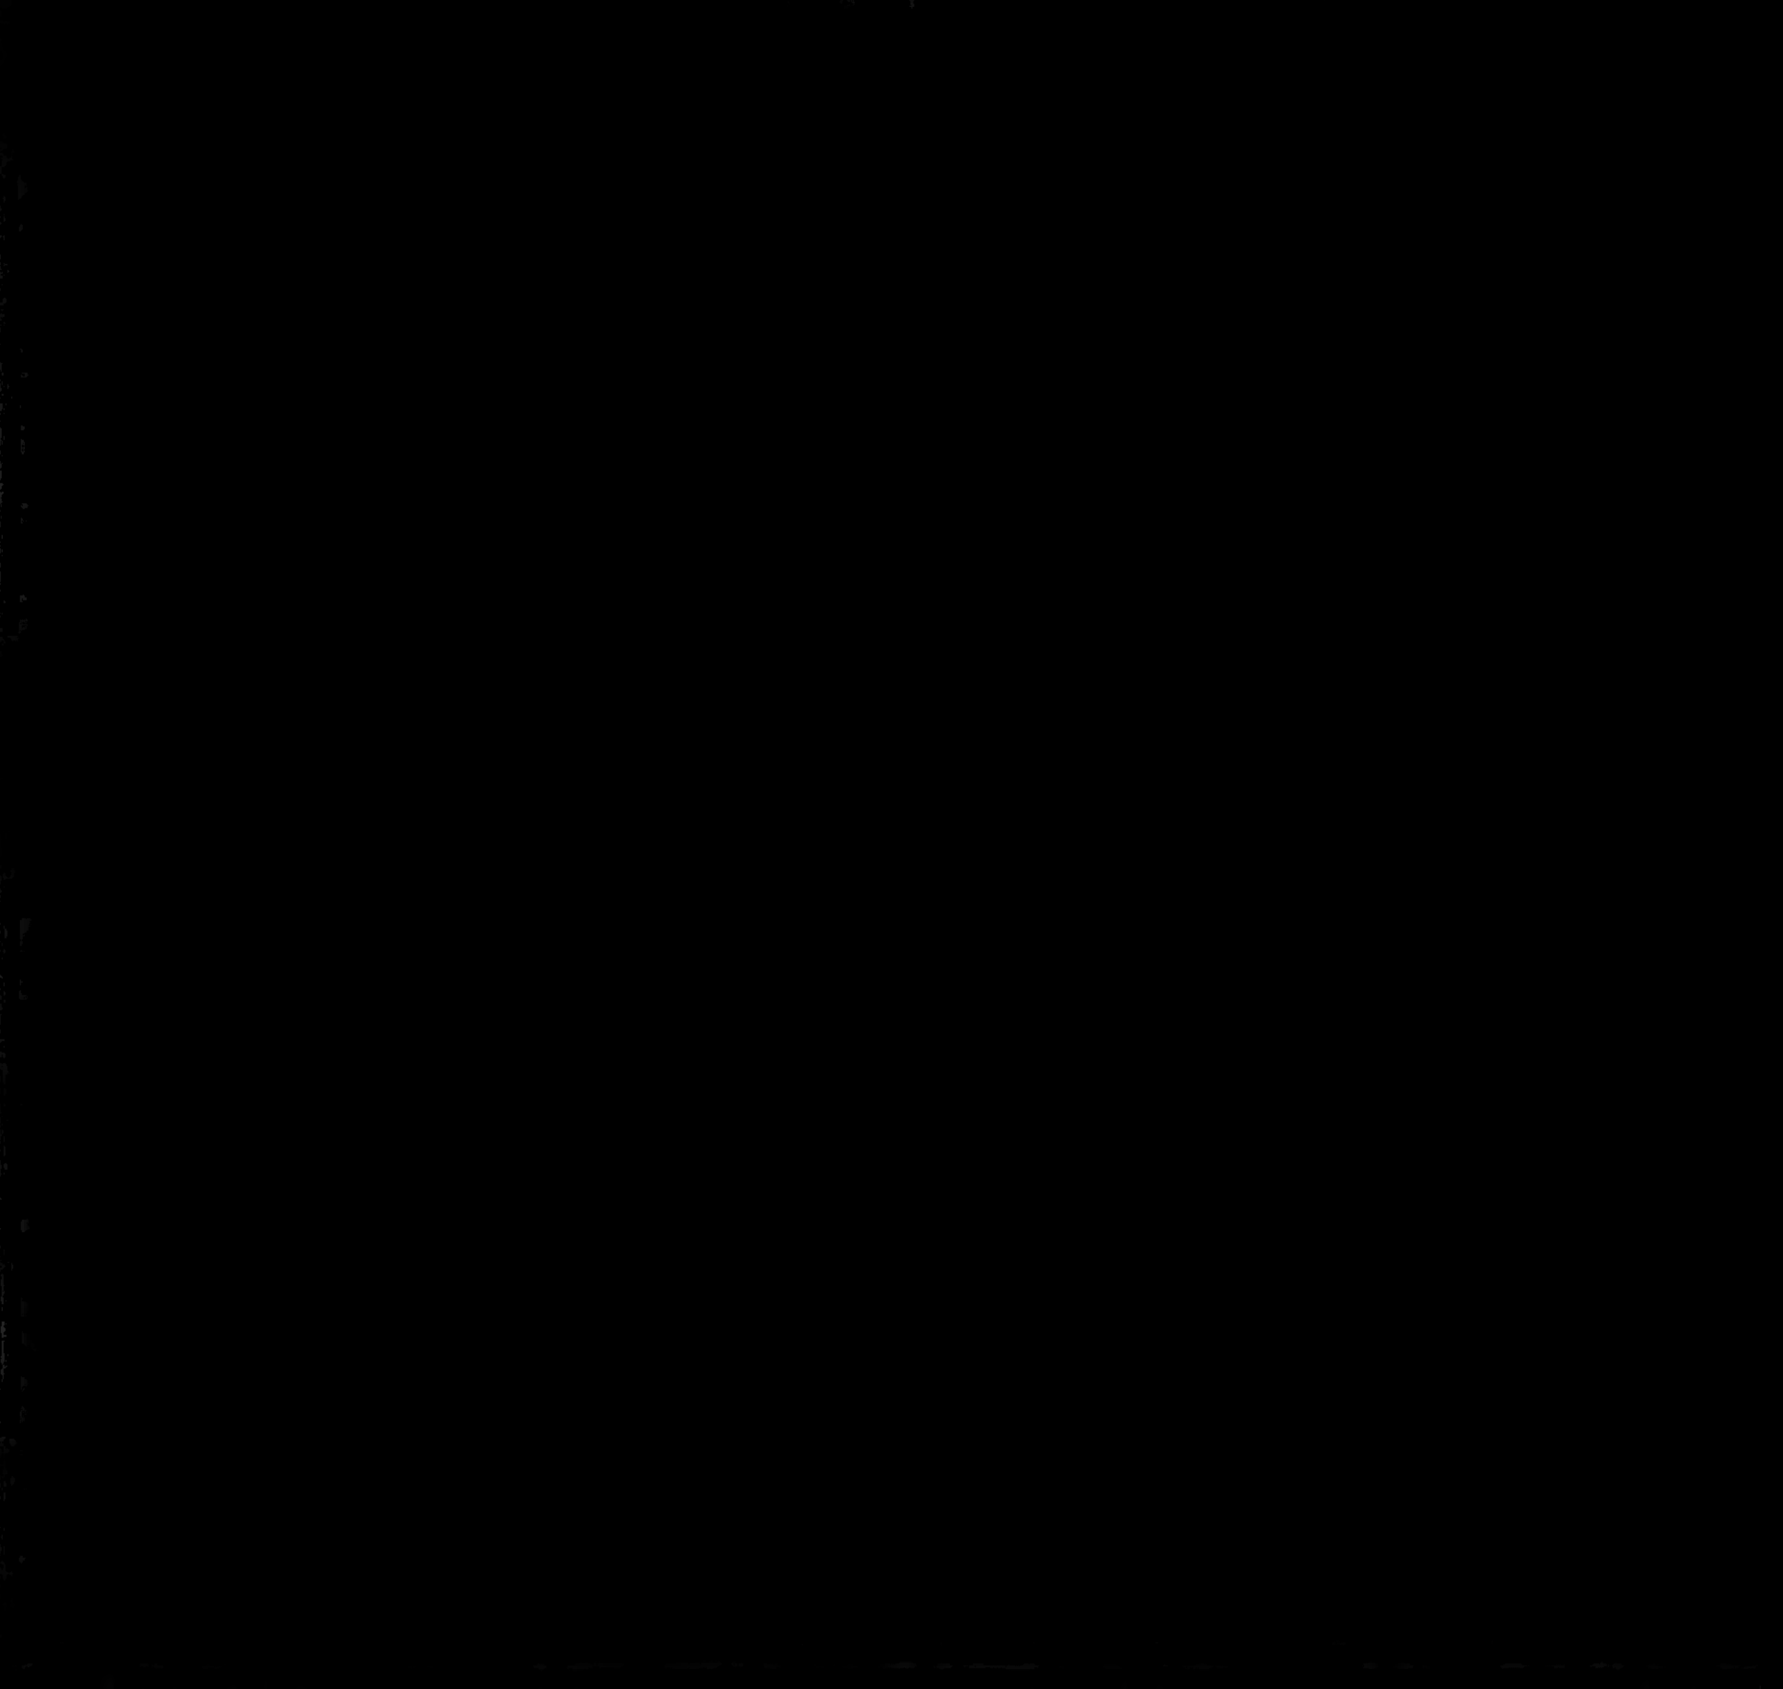
How to find the formula.



INQUIRE®/Text:

Helps you find what's buried in your database.

You don't have to be an Einstein to realize that numbers are only part of the data your organization needs in order to be effective. As often as not, the information you need consists of a few key phrases buried inside a mountain of written documentation.

Until recently, accessing this information was a nightmarish task, largely dependent on paper filing systems and relatively fallible human memory.

But with INQUIRE/Text, it's easy. Powerful search commands zip through everything from research reports to correspondence—extracting vital information faster and more accurately than ever before.

The result is a quantum leap in the quality and diversity of online information available for decision support. For the first time, textual information can be retrieved and manipulated as easily as numeric data—with an output of up-to-date, integrated management reports.

No wonder INQUIRE/Text users include some of the world's leading scientists and researchers —not to mention lawyers, librarians, engineers, corporate records managers, and entrepreneurs.

And no wonder more and more people everywhere are seeing text management as an indispensable element of the Information Center.

INQUIRE/Text. The only system around that can turn a mass of text into a source of energy.

INFODATA®

Special Report

AT&T subsidiary undertakes two-part effort to boost

JACKSONVILLE, Fla. — A two-pronged approach to software productivity is helping an AT&T subsidiary here meet the challenges of the competitive postdivestiture world.

American Transtech, Inc., established by AT&T in 1983 to provide shareowner services during the divestiture, branched out after the Bell system officially split in January 1984. Today, it offers record keeping, direct marketing and other information services to outside clients.

The expansion required massive software development efforts. In the past year, American Transtech has doubled its programming staff from 100 members to 200 and has developed just under one million lines of Cobol code, according to David Adler, the firm's director of information systems development.

Growth, however, was not a sufficient condition for survival in the market American Transtech had entered. "We have a mission to be a responsive provider of quality, innovative information systems to our clients," according to Adler. To prosper, he added, the company had to speed up its software development efforts and keep costs competitively low.

The firm targeted software development as an area that needed improvement. Programming was central to the creation of any service offerings, yet it lagged behind other efforts such as hiring personnel and installing hardware.

American Transtech attacked the problem on the following two fronts:

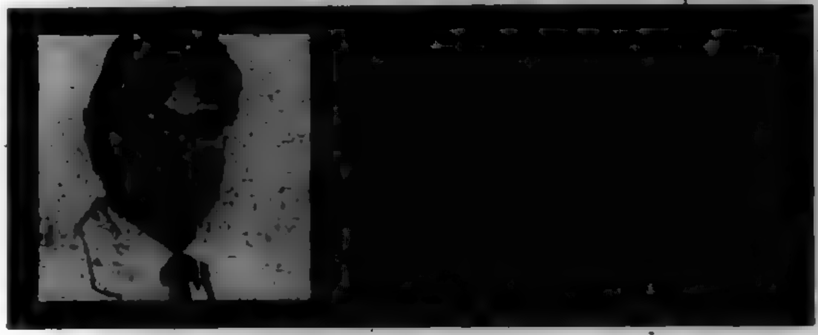
- In the DP shop, it brought up a Cobol code generator to give programmers the ability to develop and maintain applications more efficiently.
- In user departments, it installed a mini-based relational data base management system (DBMS) to allow users to create some of their own applications.

Code generation. American Transtech runs Master Software, Inc.'s Programaster Cobol generator on a 32M-byte IBM 3081. To develop code, programmers work through a set of menus then call on the generator to compile prewritten modules into a working application.

They begin by selecting one of six functions: edit, update, report, sort, merge or explode. Screens within each function guide programmers through the development process. According to the choices a programmer makes at each stage, the generator pulls prewritten modules of code from a library and inserts them into the application.

If a programmer needs to modify the prestructured logic to perform specific functions, the code generator indicates where he should insert new statements. Adler said programmers can store any logic-specific modules they write in the code library, from which they can call for the module in future applications.

On average, he said, the programs American Transtech has developed with the code generator — a group of about 60 programs — consist of about 72% generated code. Programmers developed most of these programs during a five-week trial, after which the firm deinstalled the code generator until the firm signed contracts with the vendor. American Transtech installed the generator in production mode early in July and is currently working on a 50-program application scheduled for completion next month.



Because the firm still has relatively little experience with the product, Adler said, no one has calculated exact savings in time or money. During the trial period, however, programmer productivity (measured as performance against schedule) increased by 28%.

Adler said that in about 10% of all programs, development with the code generator actually took longer than without the tool. This set of programs — mainly those for scientific processing — did not conform well to the generator's set program structure and required extra manipulation by American Transtech's DP staff members.

Because between 80% and 90% of the firm's programs target more mundane applications (financial record keeping and mass mailings, for example), Adler said he expects most development to proceed as fast or faster than it did when the shop used traditional coding techniques.

The firm's main savings, however, have come in the program testing cy-

its software development

cle, which now takes less than half the time it once did, regardless of application type. Testing is faster, Adler said, because a substantial part of each new program is prewritten code that does not require testers' attention.

Although programmers initially hesitated to accept the code generator, time savings have helped win them over. Adler estimated the average programmer has chopped between 10 and 15 overtime hours from his workweek.

Programmers' biggest qualm, he said, had been that the generator would make their job an assembly line process, with little creativity involved. Most of them came around, however, when they accepted coding as a routine task and learned to devote their creativity to initial project analysis.

Regina Alai, manager of the firm's development team, said the code generator eventually helped form a strong sense of teamwork among programmers. "We now spend more time communicating and designing instead of coding and testing," Alai said.

"Our software products are of higher quality, and the programmers feel better about their jobs," she said.

In addition, Adler said, programmers have been able to spend less time at their desks and more in meetings with user groups. Through their involvement, they have come up with ideas that help save the company money.

End-user computing. To promote software development in end-user departments, American Transtech recently installed a relational DBMS, Oracle Corp.'s Oracle, on four AT&T 3B2 minicomputers.

In preparation for the software, the firm sent one representative from each of its user departments to a five-day vendor training session. Each representative is currently instructing employees in his department on the use of the product.

Some DP staff members are also helping the user departments, but these systems people are trying to keep their hands off as much as possible, Adler said. "We continue to work closely with our users but have assumed a coach role, rather than a developer role."

Users are still experimenting with the DBMS and its query language, and they have not produced any working applications. But when these users come up to speed, they plan to develop applications for management reporting, manpower scheduling and similar tasks, according to Adler.

He said applications written by end users will not decrease DP's work load or backlog because the department never devoted much time to developing such programs. The DBMS will, however, allow end users to bring up applications they had little chance of ever getting from the systems staff.

Cobol still going strong, despite grim predictions

By Steven Pfrenzinger
Special to CW

Cobol's future is not as bleak as many would have you believe, especially in IBM's IMS DB/DC, CICS/IMS and DB2 environments. It's alive and well as a procedural language embedded within a group of powerful new IMS application generators used within or under the influence of the development center..

The reasons behind why Cobol did not fade away as predicted by the experts are simple.

- No performance-oriented procedural language has been able to replace Cobol adequately.
- IBM has added significant improvements in VS Cobol II.
- Cobol is not really the problem when developing on-line applications.

First, the fact that no programming languages have come along to replace Cobol adequately is nothing new. The shortcomings of other procedural languages are substantial and have included performance penalties, reduced functionality and restrictive architectures. These and other shortcomings have meant no one language can be used in all situations.

Second, VS Cobol II has significant improvements, probably not enough to quiet the ardent anti-Cobol group but enough to show that Cobol can be enhanced to improve productivity during both development and maintenance.

These enhancements include a PERFORM statement variation for in-line looping without GOTOs, the new EVALUATE/WHEN statement combination for complex conditional tests in a case structure, the INITIALIZE and SET statements to assign values to data items and conditional variables, nested COPY statements, a batch debugging tool, formatted dumps and improved compiler listings.

Add to this the command or macro-like feature of some Cobol-based application generators, and Cobol's future looks even better. This feature allows blocks of reusable Cobol code to be built, modified and inserted into generated Cobol programs. These blocks of reusable code can be built by senior developers to blueprint common functions within a system or installation, which provides major opportunities for productivity.

Third, Cobol is not the problem. It is only the language used for procedural logic requirements, and that is not the real challenge in developing on-line applications. The real challenges come from screen definitions (for example, message format service and basic mapping support), data communications interfaces (for example IMS, DC and CICS), data base access (for example DL/1 and SQL), testing, prototyping to validate user requirements and others that have nothing to do with Cobol's merits as a procedural language. Cobol is continually blamed for low productivity in on-line applications development while the items listed above are the real culprits.

Simplifying these challenges is what most of the Cobol-based application generators are attempting to do.

The debate over Cobol's future will likely continue. However, the fact remains that there is a huge base of trained Cobol programmers and plenty of existing and newly developed Cobol systems on which they can work.

Given that we can get substantial improvements in productivity from these Cobol programmers, IMS and CICS installations can follow a more evolutionary, rather than a revolutionary, path to increased productivity.

Pfrenzinger is president of IMS Consulting, Inc., an Encino, Calif.-based consulting firm.

[illegible]

Documentation boosts systems development effort

By Gary Laneman
Special to CW

Systems developers toil to produce documentation for business users but direct little effort toward meeting their own needs. This lapse hinders systems development productivity.

Documentation can improve productivity in systems development, as it does in business applications, by providing efficient means to record and share information. But to take advantage of these efficiencies, systems developers must identify their needs and meet them.

Identifying documentation needs. Documentation should span all phases of the systems development life cycle. To do so, it must encompass three broad categories — strategy, management and technology.

■ **Strategic documentation.** In order for significant change to occur, managers must make an accurate articulation of the change; strategic documentation accomplishes this.

The strategic documentation process begins with the statement of a company's business strategy. At a high level, business strategy documentation sets an organization's direction for products, services and support. At the systems level, it indicates a company's best bets for using emerging technology to exploit market opportunities.

■ **Management documentation.** Broadly, this category includes all documents used to manage systems development activities. Management documents include performance objectives, project schedules, status reports and performance reviews. This category also includes guidelines for systems standards and methodologies and for documentation and investment.

> ”
>
> *Every organization needs an integrated framework of documentation that will promote productivity by helping systems developers reference, share and manage their documentation.*

Management documentation supports strategic documentation by giving feedback about a firm's advancement toward strategic goals. It provides the tools for managers to assess and improve their organization's systems development productivity.

■ **Technical documentation.** Historically, this category has received most of the attention given to documentation. Despite the effort expended at this level, however, problems continue to occur. Run books, for example, do not contain meaningful solutions to unusual system problems.

Meeting documentation needs. Every organization needs an integrated framework of documentation that will promote productivity by helping systems developers reference, share and manage their documentation. For each of the above categories, the framework must provide developers with the following five key functions:

■ First and foremost, it must support easy, reliable and accessible means of referencing development documentation. Developers must be able to use the three classic references found in libraries: author, title and subject. In addition, systems developers should be able to use keyword searches.

Multiple, on-line indexes provide the ability to locate documentation quickly, but not all documentation resides on-line. Any reference scheme, then, must address both on-line and off-line documentation.

■ Second (because, over time, more and more documentation will reside on-line), the documentation framework must provide developers with a means to print some or all of a document on demand.

■ Third, the framework must provide on-line development facilities. Such facilities alleviate many of the problems associated with keeping documentation up to date. They provide change control, for example, which protects users while developers change the system.

■ Fourth, the documentation framework should give developers an opportunity to share some of the unique or interesting ways in which they have used different tools. An electronic bulletin board, for example, lets systems developers improve their productivity by using other people's experiences as a springboard.

■ Fifth, the framework must provide a monitor that collects information on the successful and unsuccessful use of documentation. A monitor provides information that helps answer questions such as: "What documentation is used most frequently?" and "What documentation is sought unsuccessfully?"

Laneman is a senior systems consultant for Bank of America, which is based in San Francisco.

DCD II

ACTIVE DOCUMENTATION
AND ANALYSIS
FOR THE COBOL FUTURE

DCD II provides automatic documentation and analysis for COBOL programs and systems of programs. DCD II aids everyone - programmers, analysts, managers - involved in COBOL development, maintenance, and debugging. It guarantees current and accurate documentation, assists in standards enforcement, and provides auditing control.. Available for IBM OS or DOS and SPERRY 1100 Series.

Over 500 users have comments like this about DCD II:

"The Source List Report has proven so useful that it is included on every compile done in the department."

"...a data name may be accessed in several hundred programs, but we needed to know which programs altered it. This would have been nearly impossible previously, but DCD II does it automatically."

"The time savings afforded by the on-going use of DCD II became even more important as the programming staff personnel changed."

"I would equate a program listing without DCD II to a reference manual without an index; it's that beneficial."

Why don't you learn what DCD II can do for you? Write or call for more information.

MARBLE COMPUTER, INC.

THE COBOL ENVIRONMENT COMPANY

PROTOTYPE from SR/29

With the system in place, Johnson said, "we can now offer our independent agents an industry leader — instant policy turnaround — . . . an incredible competitive-advantage that no one else I know of currently offers."

Capitol Bankers would not have attempted instant turnaround, either, if it still relied on Cobol programming, he said.

According to Johnson, "We did not even envision such a system until we had Rexcom in-house."

> 'We can now offer our independent agents an industry leader — instant policy turnaround.'
>
> — Don Johnson
> Capitol Bankers Life Insurance Co.

System up quickly

Using the fourth-generation language, programmers brought up the Rexcom system in less than four weeks.

Since Capitol Bankers installed Rexcom, it has used the language and DBMS in about 75% of its new applications.

Programmers, however, rarely write a complete fourth-generation program; rather, they develop data bases and screens in Rexcom and create computational subroutines in Fortran. Johnson said this approach — using the most appropriate language for a given task — has been the reason for his staff's success.

According to Ehlen, Capitol Bankers' users have had few problems with response time, even though the system normally supports between 35 and 55 concurrent users and includes several data bases with up to 100,000 records.

Users sometimes have to wait for their initial system inquiry, but subsequent inquiries generally take less than three seconds, he added.

Ehlen, left, and Johnson

MODEL from SR/28

established as the preferred definition strategy. Prototyping will be used as the cutting-edge definition technique to get a verified agreement on the user's needs quickly. Prespecification methods will then be used to complete those parts of the application that do not lend themselves to model building.

The rationale for this is simple: Prototyping fits naturally the way people normally decide on what they want.

Fourth-generation development methodology. Prototyping will lead the way to a modern fourth-generation development life cycle (see figure 1). The attributes of such a life cycle would be as follows:

- Prototyping will reduce application development risk. The strategy is straightforward: Invest neither substantive human nor machine resources in developing an application until a working model has been experienced, critiqued and agreed to by all affected users.
- Performance modeling will assure operational feasibility. The results of the functional prototype will provide the necessary metrics to permit meaningful performance modeling to assure and define operational feasibility.
- Rapid and responsive application development. More then anything else, users want applications rapidly. By leveraging the prototype into production by optimizing it, the life cycle will be compressed.
- Fully leverage tactical software. The powerful software that enables the rapid prototyping will be extended to the entire life of an application. From feasibility through system evolution, an integrated set of software will track, build and maintain the system.
- The system life cycle will trade conjecture for confirmation. Rather than proceeding solely on paper specifications, the system life cycle will be punctuated by numerous small, rapid experiments to confirm the wisdom of an approach.

In conclusion, fourth-generation system development will bring together many of the best current ideas on software development and package them into a responsive but orderly process.

The trend toward a user-friendly DP style is becoming evident. Whether the subject is languages or the user/machine relationship, the trend is clear.

FOURTH

from SR/23

and UFO by purchase of Oxford Software Corp. Dun & Bradstreet Corp. now owns both Nomad2 by purchase of National CSS, Inc. and the Millenium development harness through its purchase of McCormack & Dodge Corp.

SAS Institute, Inc. bought the System 2000 data base system. The Canadian conglomerate Crowax bought the Model 204 data base via purchase of Computer Corp. of America.

The software tool conglomerate Sterling Software, Inc. acquired Mark IV by taking over much larger Informatics General Corp.

Standard unlikely

Under these circumstances, it is unlikely that any fourth-generation language standard will emerge.

Instead, existing languages will continue to evolve and extend. IBM VS Cobol II is already available, and Ansi Cobol 85 is due in November.

> *Under these circumstances, it is unlikely that any fourth-generation language standard will emerge.*

As if anticipating this trend, the fourth-generation language vendors are hedging their bets. Applied Data Research, Inc. offers ADR/DL, which is an enhanced Cobol, and Martin Marietta Data Systems announced in June both a Cobol/XE and a PL/I-like System Building Executive.

Supporting existing languages key

Fourth-generation language vendors will survive by moving away from inventing languages and moving toward supplying support functions that are compatible with existing languages.

With this service, they can promise to assist the data processing professional in the arduous task of keeping current systems targeted on current needs.

This is a less magical promise than that of the fourth-generation language, but it is one more likely to be fulfilled.

BOOST

from SR/22

ing data query, report generation, graphics generation, decision support, applications generation, micro-to-mainframe links and, in some cases, a fully integrated micro version of the mainframe product. The languages are appropriate for use both by non-DP end users and DP professionals.

Most fourth-generation languages provide a user-friendly front end that may be learned easily by end users to support data base query operations and the generation of screens, reports, graphics and application prototypes.

In many organizations, DP professionals use these tools to create complex applications requiring extensive functionality and large amounts of procedural logic.

Most fourth-generation language tools routinely demonstrate about a 10:1 improvement in productivity relative to Cobol for business applications of moderate complexity. Improvements of 3:1 relative to Cobol are typical for complex applications requiring extensive procedural logic.

These productivity gains are achieved primarily by the nonprocedural components of the tools, that is, the ability to support very rapid specification of data dictionary entries, data views, edit criteria, display screens, menus, reports, graphics and simple prototypes. Numerous users report productivity gains in the range of 10:1 or 20:1 relative to Cobol for on-line transaction processing applications involving large numbers of screens, transactions and reports.

Significantly lower productivity gains, in the range of 3:1 relative to Cobol, are reported for applications that require an extensive amount of procedural logic.

Advantages

Organizations that have made a commitment to fourth-generation languages and to an appropriate development methodology have found that they can develop applications much faster and at lower cost than with Cobol. They are able to develop time-critical applications rapidly and to reduce the backlog of pending applications.

One of the most important advantages of the use of fourth-generation languages is the ability to solve critical business problems quickly and to react immediately to business or market changes through the development of applications and products. Fourth-generation languages may be used very effectively to gain a competitive edge in a rapidly changing environment.

The advantages of fourth-generation languages will become even more pronounced in the future as information services moves away from a mainframe-oriented environment toward an end-user environment dominated by networks of personal computers.

Highly integrated fourth-generation language micro-mainframe tools, such as Focus and PC/Focus from Information Builders, Inc., enable users of IBM Personal Computers to query data on a mainframe, download the extracted data transparently to the micro and automatically format the data for use by standard Personal Computer tools such as Lotus Development Corp.'s 1-2-3 and Ashton-Tate's Dbase III.

There are several ways to simplify VM for your users...

and they're all called MULTIPAK/VM™

MULTIPAK/VM is a productivity aid designed by SKK, Inc. to enable your VM users to more easily perform daily tasks. MULTIPAK/VM is actually a collection of four separate but related VM utilities that improve upon some existing facilities, while adding some powerful new capabilities for VM users under CMS.

MULTIPAK/VM was written to assist users at all levels of experience. The package offers a trove of features that will benefit the most experienced VM/CMS programmer as well as the non-technical, inexperienced VM user. In fact, we developed MULTIPAK/VM for our own use based upon our years of IBM and VM experience from our ACF2 product line. SKK is a leader in IBM mainframe software products, with over 1,600 user sites worldwide.

Here are just a few of the many ways that MULTIPAK/VM can help you:

1. SPOOL VIEWER

Spool Viewer gives users the ability to now display all spool files. This includes print and punch files, which were previously inaccessible. With Spool Viewer users are no longer limited by file size, because the entire spool file may be viewed regardless of size.

Spool Viewer offers user-tailorable screens, which may also be used to change the displayed data. The Display/Change feature enables users to change file attributes by simply keying-over the displayed data without using complex CMS commands.

2. SHORT CUT

Short Cut is a command shell which simplifies CMS by guiding users through a multilevel system of command panels. Short Cut is designed to reduce the CMS learning curve and to increase efficiency of experienced users by offering simpler, faster alternatives to existing facilities.

Managers may use Short Cut to restrict CMS command usage by specific groups of users or by individuals.

3. SCREEN PAINTER

Screen Painter enables users to construct full-screen application panels by laying out screens exactly as they are to appear. Screen Painter offers new levels of performance, while automatically validating all screens and allowing users to print screen hardcopies. These screens may be called from an assembler program, and EXEC, or a high-level language.

4. STRETCH EDIT

Stretch edit offers VM users new and enhanced XEDIT capabilities. MVS or VS1 datasets, or parts thereof, may be copied directly into CMS files without losing the current line displayed. Stretch Edit allows users to swap screens, rename files in one step, and enhance normal program function key usage.

5. FREE TRIAL

SKK can also give you a productive way to evaluate MULTIPAK/VM; a 30-day free trial. Simply mail in the completed coupon or call a MULTIPAK marketing representative at 312/635-1040.

What could be more productive? Your company..., with MULTIPAK/VM.

WHEN THE CHAIRMAN EXPLODES OVER A SECURITY LEAK, WHAT'S YOUR DEFENSE?

VMCENTER:

THE ONE INDISPENSABLE SURVIVAL TOOL FOR VM DATA CENTER MANAGERS.

It doesn't matter who actually leaked it—if there's a failure in system security, it's *your* problem.

But now, at last, you have an ally. In VMCENTER.

VMCENTER puts you squarely in control of system resources—providing multiple levels of authorization, for maximum protection against security violations.

It also allows you to do a lot more. Change passwords in a flash, encrypt data through simple commands, and keep top management informed of potential problems through a variety of reports.

Best of all, VMCENTER makes *you* secure—knowing that problems are being taken care of *before* they happen, not after.

But there's more.

In addition to security problems, VMCENTER solves a lot of others, like disk and tape management, resource scheduling and accounting, even workload balancing. And it does it all in an integrated manner that's more effective than any possible collection of quick fixes.

VMCENTER. It's a survival tool—and then some. Once you use it, you'll wonder how you ever got along without it.

And the Chairman may even learn to feel the same way about you.

For more information on VMCENTER, call or write VM Software, Inc., 2070 Chain Bridge Road, Suite 355, Vienna, Virginia 22180, telephone (703) 821-6886.

Insurance firm secures DSS with statistical tool

GRAND RAPIDS, Mich. — A statistical analysis software package helped bring together end users and the MIS department at an insurance firm here in a project to develop a decision support system (DSS) during a pressing DP backlog.

Users from the marketing department at Foremost Insurance Co. wanted a system that would help them target new customers and retain old ones by reporting information such as customers' demographics, the time periods during which they held their policies, the number of claims they made and the amount of money the firm paid to them.

Until January 1984, the department channeled requests for such reports through the firm's MIS department. But, according to Ben Salzman, marketing manager at Foremost, MIS was so busy processing information for other departments that it could not turn around marketing's requests in time. "Sometimes, we simply completed report requests on our own, using hand-held calculators and typewritten formats," Salzmann said. "It was not efficient."

Marketing DSS to the rescue

Salzmann and his supervisor Jim Malnight felt that a marketing DSS would help solve the problem. "We needed a DSS to extract data easily, format that data in reports customized by the end users and allow us to bypass that MIS backlog," Malnight said. Because MIS was busy developing a comprehensive billing program for the firm, Foremost contracted a team of outside Cobol programmers to develop the data base for the DSS, which was to be called the Customer Retention Decision Analysis (RDA) system.

Once the data base for the RDA had been established, Salzmann and Cathy Bandt, a customer retention development specialist from the marketing department, planned to format reports using SPSS-X statistical software from SPSS, Inc. "I said, 'Give us a friendly data base, and we'll do everything else with SPSS-X,' " Salzmann said.

Salzmann and Bandt directed the project from the marketing end, and Dave Herbert, Foremost's systems development manager, provided help from the MIS department.

When the Cobol programmers delivered a less than satisfactory data base, Salzmann, Bandt and Herbert used SPSS-X to pinpoint problems and correct them (see story right). After the bugs had been ironed out, they put the software to its intended use — formatting marketing reports.

Pleased with marketing's role in project

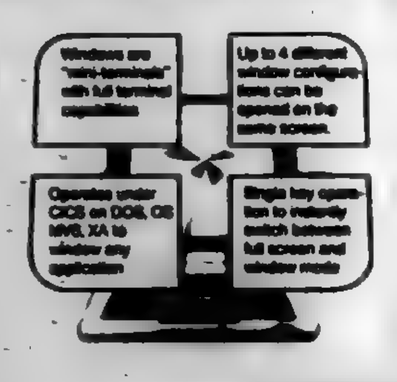
Herbert said he was pleased with the marketing department's role in the development project. "RDA was designed, tested and implemented with very few programming resources from the Foremost MIS staff. This is the first time we used this approach, and it's been very successful."

The department is made up of professional staff members familiar with reporting tools, he said, and they had the knowledge to take responsibility for some of the development. The firm had used SPSS software for seven years.

Now that the marketing department's data base system is in place, Salzmann said, the department uses SPSS sorts and aggregates to break the more than 4½ million records in the data base into smaller groups determined by information in the records' fields and to consolidate them into categories for reporting. In 1984, the department ran more than 60,000 SPSS-X jobs on a 16M-byte IBM 3033.

Bandt estimated that SPSS-X and RDA give the marketing department a report output more than 10 times greater than that of the former reporting setup. Staff members now control the format and turnaround time of their reports.

Herbert said the software processes data from the data base efficiently. "SPSS-X doesn't use up a lot of CPU cycles. I would have expected a lot more cycles given what it's doing."



Windows are "mini-terminals" with full terminal capabilities
Up to 4 different window configurations can be opened on the same screen.
Operates under CICS on DOS, OS MVS, XA to window any application
Single key operation to instantly switch between full screen and window mode

WINDOWS ON YOUR MAINFRAME TERMINAL
CICS–WINDOWS™

SAVE YOUR HARDWARE $$$

- Window facilities on every 327X terminal without any changes to your hardware or software
- Work with 2, 3, even 4 transactions simultaneously without losing valuable time switching back and forth between applications
- Increase productivity by having needed information instantly available on the same screen including other applications, menus, help screens, prior transactions, editors, notepads, etc.

Guide to Software Productivity Aids

A Directory of commercial software tools to help improve the productivity of your system development efforts and equip the Information Center with user friendly packages.

TOOLS FOR DEVELOPMENT: Most installations continue to have a substantial amount of traditional development activity which for years has been marked by low productivity and cost overruns. Tools for all phases of the system development life cycle can help to substantially improve productivity.

TOOLS FOR THE INFORMATION CENTER: In Information Centers, users are given access and software facilities to do many of their own applications. The Guide will lead you to many types of packages which are user friendly and designed for non-programmers.

[illegible]/year

- Over 1100 products
- 22 product classifications
- Cross Indexed
- Semi-annual

Overhead concerns will keep systems analysis in vogue

By Barbara F. Medina
Special to CW

Recent articles have suggested that structured systems analysis techniques are obsolete and, by inference, not needed if programmers would only switch from Cobol and Fortran to fourth-generation languages [CW, April 8].

Predictions have been made for 10 to one increases in programmer productivity with the use of data base management systems and query language software. User satisfaction is guaranteed and annoying backlogs in meeting user demand for processing will be cleared up by simply building prototype systems using fourth-generation languages, proponents claim.

Impatient, action-minded American managers, who have always resisted allocating the time and resources needed for planning and systems analyses, are being tempted by these claims. After all, DBMS and query languages do make it possible to get a system up quickly. What many managers do not recognize, however, is that these systems have a high permanent overhead and are a drain on computer resources.

Minicomputers with their single-channel I/O buses are prone to processing problems when I/O demands increase, and a variety of different software packages are used simultaneously. DBMS and query languages increase I/O demands on the system. Although minis are prone to failure from poor application design, even mainframes can get overloaded.

Well-designed data bases and efficiently designed applications can limit problems, and systems analysis is the very tool that uncovers duplication of data in records and redundancies in processing. It is because DBMS and query languages require such a large overhead that systems analysis and planning are a necessity before new applications are implemented.

As languages are developed that make applications easier and faster to implement, the well-trained analyst will be the key to successful use of computers by organizations of all sizes. What data processing managers should advocate is better theories and materials for use in training more proficient systems analysts.

In addition, nontechnical managers have to be educated to understand the long-term benefits of systems analysis and planning. Data processing managers who cave in to the immediate demands of users who want terminals or micros on their desks when they know that they are building inefficient, redundant systems are asking for trouble.

Medina is a consultant and the author of numerous articles and two books. She has also directed computer service bureaus for 12 years.

SERIX

ANNOUNCING SYSTEM V UNIX™

...puts your IBM Series/1* ahead of the pack!

SERIX is the high performance CMI version of AT&T's UNIX™ System V operating system with Berkeley 4.1 enhancements ported to the IBM Series/1 minicomputer.

SERIX transforms your Series/1 into an even more powerful, flexible, and convenient processor for general data processing, office automation, communications, and process control. Its advantages are outstanding:

Reduced software costs

Long term growth path
- Software is highly portable
- Provides access to a large, growing software base

More power from the Series/1
- Optimizing C compiler uses native code features
- All code reentrant
- Dynamic memory allocation without fixed partitions

Increased programmer productivity
- Large set of utilities
- Hierarchical file structure
- Pipes, forks, semaphores, and shared data segments

Other CMI Series/1 software
- RM/COBOL™
- UNIFY™ database management system
- ViewComp™ spreadsheet
- vi visual editor
- EDX™- to -SERIX™ conversion kit

CMI Corporation is a Master Value-added Remarketer of IBM Series/1 equipment. Leasing and other financial arrangements are available.
Contact us for further information.

Photographer - Michael Zagaris • UNIX is a trademark of Bell Laboratories • SERIX is a trademark of CMI Corporation • SERIX was developed exclusively for CMI by COSI • IBM, Series/1, and EDX are trademarks of International Business Machines Corporation • UNIFY is a trademark of North American Technology, Inc. • RM/COBOL is a trademark of Ryan-McFarland Corporation • ViewComp is a trademark of Unicorp Software, Inc.

Self-interest motivates development

By Roger E. Booker
Special to CW

DHAHRAN, Saudi Arabia — The goal for setting up a data dictionary might be described by the following Marxist doctrine: "From each according to his ability; to each according to his need." Experts from different areas provide their input so that all users can access whatever information they desire.

The best way to ensure success in a data dictionary project, however, is to satisfy the capitalist question "What's in it for me?"

During a large data base conversion project that centered on the development of a data dictionary, an international oil firm here used the maxim of self-interest to its advantage.

In 1984, the Arabian American Oil Co. (Aramco) decided to centralize its oil exploration and production information into an integrated business data base. A feasibility study, management approval, conversion planning and data base management system selection of Model 204 from Computer Corp. of America [CCA] had all been completed. The remaining tasks involved design of the new data structure and the conversion of applications software.

But the volume and nature of the interpersonal communication necessary to complete these tasks posed special difficulties for the conversion team:

- The project would cross the boundaries of two technical disciplines, engineering and geophysics, with inherent differences in terminology and data conceptualization.
- The data processing staff came from different backgrounds with training in different data base design methodologies and varying exposure to relational concepts.
- The conversion team was drawn from many nationalities: Saudi Arabian, American, British, East Indian and Norwegian, with the attendant cultural and language differences.
- By many standards, the conversion was large. It would span a user community of 600 people, with as many as 60 active participants in the conversion process. Nearly 2,000 data elements would be reviewed and more than 250 applications converted.

Early in the conversion process, the firm recognized that a comprehensive and well-maintained data dictionary system could provide the communications mechanism necessary for a successful conversion project. It also recognized the inherent pitfalls of using a data dictionary.

To overcome any disadvantages, the Aramco conversion team took several important steps:

- It customized the data dictionary software and data structure to meet the particular needs of Aramco's system development methodology. A great deal of software was developed in-house to meet local reporting requirements.

The data structure of the dictionary itself was altered to support specific needs for meta data. Fortunately, this was easy to do because of the malleable nature of Dictionary/204, CCA's data dictionary product.

- It used the dictionary actively in each phase of system development, from conceptual design to system implementation. The conversion team used

Reach 20,000 computer professionals in Mexico.

Advertise in CW Communications' Mexican publications and sell your products directly to Mexico's burgeoning computer community. According to International Data Corporation (IDC), the world's leading information industry research firm, there are over 21,000 computers in Mexico. CW Communications covers the Mexican market with two important publications: *Computerworld Mexico* and *CompuMundo*.

10,000 DP professionals in government, banking and industry read *Computerworld/Mexico*. Modeled after *Computerworld*, its sister publication in the U.S., *Computerworld/Mexico* is considered an excellent way for advertisers to reach a broad range of influential industry leaders. Twice each month, *Computerworld/Mexico* reports developments in hardware, software and terminals as well as industry trends.

CompuMundo covers one of Mexico's fastest growing market segments — microcomputers. Microcomputer growth is expected to jump 15% annually from its current base of 17,000. Each month 10,000 micro users and potential users turn to *CompuMundo* for the latest information on micros, programming and all the latest industry developments. Telecommunications and electronics specialists also rely on *CompuMundo* for up-to-date industry information.

CW International Marketing Services makes advertising your products in Mexico, and around the world, easy. We have over 50 publications in more than 25 countries around the world. For more information on our wide range of services, complete the coupon below and mail today.

Global approach builds flexibility into programs

Lets systems keep up with future changes

By Rusty Williamson
Special to CW

Executive management's first thought is to blame MIS managers, project leaders and staff members for backlogs, missed deadlines and bugs. The real cause of such problems, however, is often built into the system itself: Many system designs do not anticipate change and cannot accept it.

If software developers hope to increase productivity, they must plan for the future. A common methodology, the use of global procedures and definitions, can help them do so.

By definition, the methodology relies on two components: global procedures and global definitions (see story below). Global procedures — procedures for common, low-logic-level tasks — are stored on disk files, as are global definitions, which are definitions for common variables, structures and files.

Compiling programs

Programmers can call on the system to compile the procedures and definitions into any program or group of programs that requires them. If a programmer changes a procedure or definition in the source code, the system will compile that change into all relevent programs. With this methodology, coding for most software systems is basic commonsense programming.

Global procedures and definitions reduce development, debugging and support man-hours. Because it removes redundant complexities from main logic, it makes the growing complexity of a system relatively easy to handle. Because it stores common components in one place, rather than in every program, it decreases source and object code memory requirements.

The advantages of using global procedures and definitions span a system's life cycle and can be illustrated using two hypothetical systems: System G, which uses global procedures and definitions, and System B, which does not. Aside from methodology, both systems are identical: Each consists of 125 programs and contains a data base of 45 files.

Development phase. During the first phases of development, Systems G and B proceed at much the same pace. At first, B outpaces G because G's development staff is spending some of its time planning global procedures and definitions disk files.

But System B's development team writes each of its 125 programs from scratch and codes each of its programs and processes as a stand-alone project. System B's development effort soon begins to snowball with increasing complexity and disorganization.

System G's effort is more coordinated. As each program is written, programmers develop, test and debug procedures and definitions. The programmers use these same components again and again in other programs. As the coding of each program proceeds, more global procedures and definitions become available for future development. More and more, developers need to create main logic only.

Time-consuming complexities gradually disappear, and file definitions no longer need to be keyed in. Systemwide naming conventions and one-change enhancements become by-products of development. G's development is smoother than B's and soon outpaces it.

Shakeout. As program development ends, a system debugging phase begins. During this shakeout period, both systems develop a loss of interprocess messages during heavy system usage — a tuning problem. To compensate, programmers must increase time-out values for interprocess messages from .01 to .08 seconds.

Programmers for System B have used a constant value, .01, in the code and must search each program for every occurrence of the interprocess message code, keying in an 8 over the 1 each time. Some of the 125 programs will be affected, and B's development team, not knowing which ones, must search each.

For System G, on the other hand, programmers have used a variable called "INTER-PROC-TIME-OUT," which resides in source code in one place — the global definition disk file. It has been set to .01. One programmer keys an 8 over the 1, runs the compiler and goes home.

The compiler links the new definition, "INTER-PROC-TIME-OUT = .08," into each affected program as the program is compiled (see chart). In each of the 125 programs, every occurrence of the interprocess message code uses "INTER-PROC-TIME-OUT," which is now equal to .08.

Production. During the production phase, Systems G and B, like most large systems, require continued programmer support. New protocols, file formats, applications, reports and other enhancements continually bombard the original system.

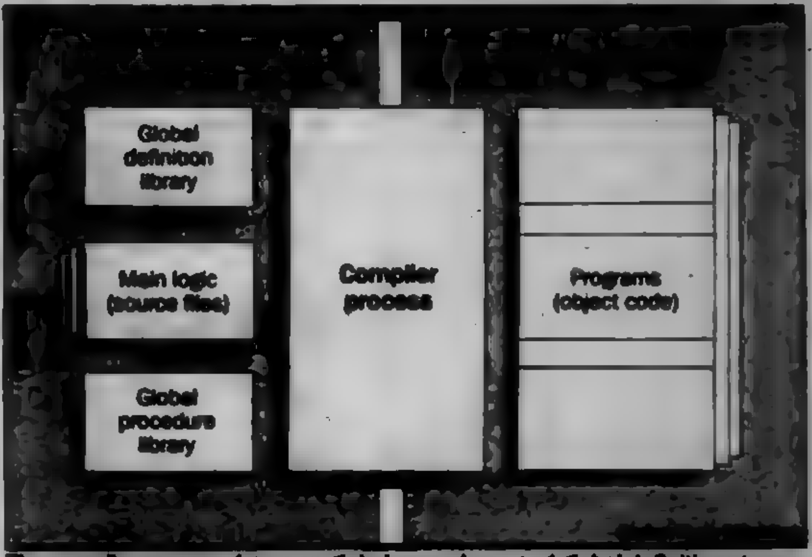
System B requires more programmer man-hours than System G does. Its code contains varying conventions and programming styles, which confuse maintenance programmers and stall their work. Moreover, maintenance employees must change code many times in many programs. Under these burdens, the programming department increases both its size and its cost to the company.

Inside the programming department, this system structure eventually brings on impossible work loads, widespread discouragement and frequent staff turnover. To make matters worse, new employees coming aboard must face the system's bewildering maze; they take a while to become productive.

System G, on the other hand, has a clean, consistent structure that is easy to maintain. Coding enhancements are easier because all changes are global.

Death. Normally, the death of a software system occurs when the effort that goes into continued support or required enhancements equals the effort that a rewrite would entail. System G outlives System B, if for no other reason than its organization and ease of enhancement.

When it dies, however, System G will be relatively easy for programmers to rewrite. If the rewrite does not involve a major environment change, for example, a new programming language, most global procedures and definitions will stay as they are.



The compiler process draws on global procedures and global definitions to create uniform, easy-to-maintain programs.

> *If software developers hope to increase productivity, they must plan for the future. The use of global procedures and definitions can help them do so.*

Williamson is a programmer/analyst for Gascard Club, Inc., a Del Mar, Calif.-based company that serves a network of independent petroleum marketers.

Global procedures, definitions: components of uniform system

[illegible]

■ The procedure entails complex calculations [illegible].

Global definitions. These are a system's variable names, structure names and file definitions.

Under global procedures and definitions, they are commonly kept in a disk file. Compiler directives then selectively pull the definitions from the disk file and insert them into main programs.

Because definitions are not repeated in each program's source code, the setup saves disk space and reduces code entry.

It also enforces systemwide naming conventions and ensures that changes to file layouts affect [illegible] programs.

Selling systems software? In September Computerworld Focus targets your market.

When it comes to systems software, there are no easy choices. So in the September 18th issue of *Computerworld Focus* on Software: Systems, we take a good hard look at what's available now. And what's coming down the road in the near future.

Topics will include all the building blocks available for a fully integrated system. Like information center packages. Operating systems. Data base management systems. Productivity tools. Data dictionaries. Decision support systems. Even things like artificial intelligence and fourth generation languages.

We won't just look at the pieces. We'll also discuss how they work together to provide a completely integrated system for companies of nearly every size.

And we'll target right in on your market. 128,000 paid *Computerworld* subscribers. Plus thousands of attendees at the Software Expo in Dallas in September.

So if you've got systems software to sell, we've got the perfect place to do it. The **September 18th** issue of *Computerworld Focus* on Software: Systems. But hurry, closing is **August 9th.**

For more information, contact Ed Marecki, Vice President/Sales, *Computerworld Focus*,
375 Cochituate Rd., Framingham, MA 01701.

Solid maintenance spurs development

By Ronald A. Zink
Special to CW

Most MIS managers understand that good systems design and programming techniques can help reduce future maintenance efforts. Many do not realize, however, that the reverse is true as well: A good maintenance program can increase development productivity.

One of the most disrupting experiences in the development of any computer system occurs when a project begins to expand uncontrollably in scope, with users demanding more and more features they feel must become part of the system. Such expansion is often a symptom of a poor maintenance program.

In such cases, users who attempt to expand the scope of projects are acting quite rationally, for two reasons:

- They know that if development moves on to a new project, they will see little activity in their area for a long time — years, perhaps.
- They know that, from their company's viewpoint, there may be more productive projects to be done, while nonetheless feeling that it is their turn. They have been subjected to the frustration of waiting in line for years, and they are not about to give up their place until they have gotten as much as they can.

Poor maintenance programs are almost invariably caused not by the abilities of the people involved but by an improper attitude: the attitude of users and programmers that systems should be completed in one fell swoop. This attitude not only forces the user to ask for the definitive system but also causes follow-up maintenance work to become a random series of fixes.

Systems must evolve

Good maintenance programs, on the other hand, arise from a healthier attitude: the attitude that systems must evolve. This attitude allows the MIS department to take a system and break it into a series of optimal implementations, a series of properly graduated steps. It helps the organization move forward in a controlled, low-risk manner.

MIS managers fool themselves when they think they can implement a system that does all it should. They have neither the resources nor the ability to design such a system. A system is never finished; its requirements change constantly because of fluctuating business conditions and the growth of users' expertise.

In reality, managers and their staffs should try to lay a solid foundation that provides key benefits right away and can be built upon later. The DP staff should also plan on revising the system, as part of the maintenance function, on a periodic and scheduled basis. Everyone involved will then be in a better position to evaluate the next step.

Within a system life cycle that includes periodic reviews and enhancements, the user changes his attitude toward any initial development project. Users know they will get their day in court fairly soon, at a time when they will be in a good position to identify the types of enhancements they need.

Developers benefit because they can now concentrate on the major components of a system without being distracted by constant political battles about what features should or should not get added to a project. In turn, the development staff will produce more and better systems.

In order to gain the most from their computing dollars, companies must recognize the opportunity that planned, periodic maintenance affords. Recognition, however, is not enough; they must organize accordingly.

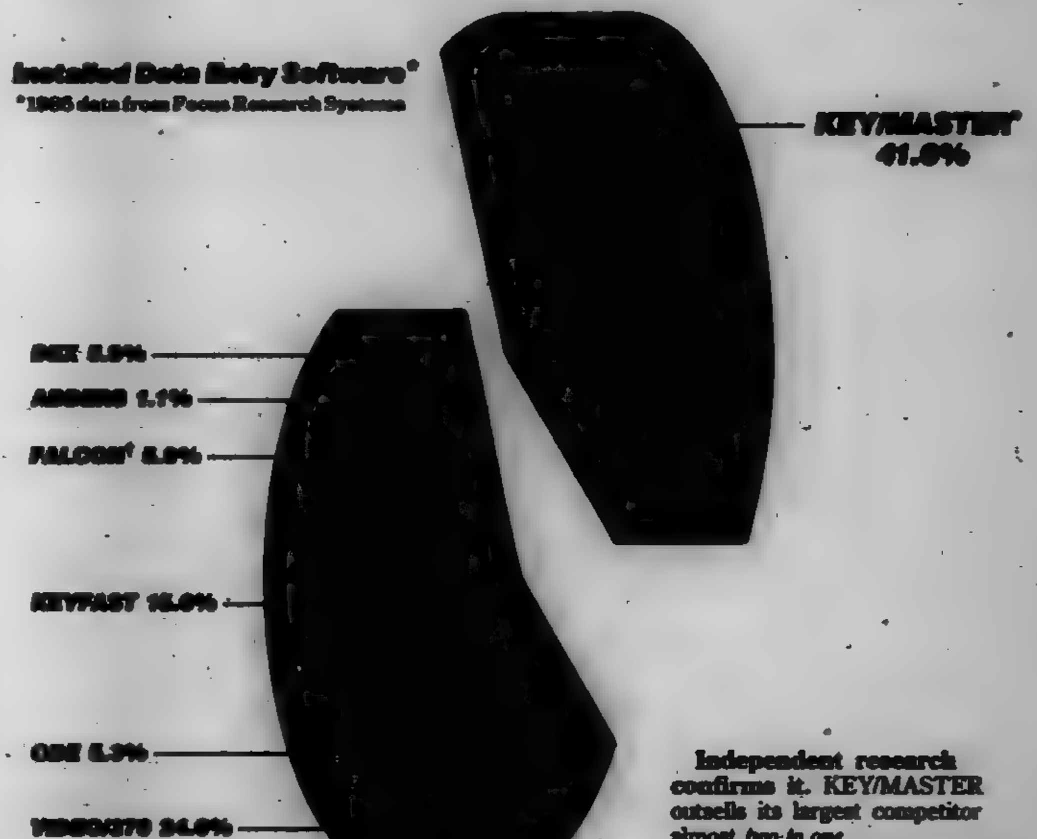
Managers must not sit by and randomly respond to user requests; this is an inefficient way to use valuable programming resources. Rather, they should do the following:

- Make planned and periodic enhancements to systems. Aggressively evaluate all existing systems on a periodic basis to identify justifiable enhancements.
- Divide the maintenance group's work into meaningful and substantial units so it can be done efficiently.
- Schedule enhancements so that they complement group members' skills and can be incorporated in the training of new people.
- Realize that users are rational beings and are willing to wait their turn if their wait is reasonable and fair.
- Maintain users' confidence by working on every system on a periodic and scheduled basis, with the effort being a function of benefits.
- Deliver enhancements the same way software houses deliver new releases: on a periodic, scheduled basis.

Zink is manager of systems planning and support for Beecham Products, a Pittsburgh-based consumer products company.

More IBM Sites Have Installed KEY/MASTER® For Distributed Data Entry Than Any Other Software System

Installed Data Entry Software*
*1985 data from Focus Research Systems



Independent research confirms it. KEY/MASTER outsells its largest competitor almost *two-to one.*

KEY/MASTER cuts data entry costs, speeds up turnaround time and reduces errors — all without applications programming.

KEY/MASTER is continually chosen over all other data entry software for one simple reason: *"Perhaps KEY/MASTER is one of those products whose design level so closely approximates user requirements that it is virtually faultless."**

Not convinced? Find out for yourself why KEY/MASTER tops all the rest in distributed data entry software. Call 1-800-227-3800, ext. 7005, and ask for the facts about KEY/MASTER. Or, write directly to the Data Entry Experts: TSI International, Dept. #213, 295 Westport Avenue, Norwalk, CT 06856.

How to negotiate a successful maintenance contract

By Thomas R. Mylott III
Special to CW

Software maintenance affects every organization's productivity, and for every organization that relies on outsiders, a contract controls the quality of maintenance.

To negotiate and draft a successful maintenance contract, an organization must pay careful attention to its expectations and must use the best means available to prod vendors into addressing its needs. MIS managers must consider many issues when they put together a contract; the following are the most important:

- Definition of maintenance.
- Duration of the contract.
- Definition of response and solutions.

Definition of maintenance. The first step toward maximizing returns from a software maintenance contract is to define software maintenance. The simplest form is a warranty extension, a promise to correct defects beyond the software's original warranty period. Many maintenance plans go no further.

If an organization's environment is static, an extended warranty will suffice, but few environments are static: Operating systems change, hardware changes and users increase their demands for performance and functionality. MIS managers should make sure that their contracts cover changes in environment as well as modifications and enhancements to software programs.

- Changes in environment. Most software maintenance agreements include no requirement that the vendor change its software to accommodate changes in the user's environment. Many vendors do this as a matter of course, but users should not wait until the time that an upgrade arrives to find out if their vendor is part of this group — they should get it in writing.

- Modifications. Some contracts imply that modifications are part of the regular software maintenance fee, but no vendor can afford to do an unlimited amount of software modification without additional compensation.

Although it may seem clever to allow a maintenance vendor to promise unlimited modifications, it is unrealistic; unless MIS managers ask for very little, they are bound to go beyond what the vendor thinks is reasonable. The result will be a dispute and the user will receive no maintenance at all.

A better approach, contractually, is to define some objective standard by which the user and the vendor can determine how reasonable a request for a modification is.

- Enhancements. Another promise vendors often make in maintenance agreements is a guarantee of enhancements. The problem is defining what constitutes an enhancement. For some vendors, an enhancement is the correction of software errors in the form of a release. For others, an enhancement is a qualitative improvement in the software's function. Any maintenance contract ought to define what the vendor is actually promising.

The MIS manager should negotiate for a written promise that for as long as the organization pays maintenance fees, the vendor will provide the organization with every release of the software at no extra charge. If the vendor improves its software regularly, this provision can save the user organization a lot of money.

Duration of the contract. Duration, or contract term, is an aspect of software maintenance agreements that many organizations overlook.

Most maintenance contracts remain in effect for only one year. Usually they renew automatically for subsequent one-year terms.

Vendors, however, often build an escape hatch for themselves, one that allows them to terminate the relationship as long as they give sufficient notice. The effect of this provision is to allow the vendor to end maintenance after one year. From one year to the next, the user has no assurance of support. This may seem reasonable, but MIS managers must consider the consequences: Without maintenance, a user organization is nearly helpless.

The manager should try to secure, in writing, a guarantee of several years of maintenance, preferably for as long as his firm will use the software. Most vendors, however, will balk at extended maintenance agreements.

The next best thing for an organization to have is the ability to maintain its software in-house. For this, the user needs source code. MIS managers should negotiate a provision in maintenance contracts for the vendor to release its source code if it discontinues maintenance.

Definition of response and solutions. When an organization plans to have outsiders maintain its software, it expects those outsiders to get the job done. It also expects the work to

Dedicated maintenance staff key to smooth operation

By William W. Marks
and William D. Strowbridge
Special to CW

In most DP shops, programmers who maintain installed production systems consider themselves second-class citizens. They do not get to work with the latest applications and technologies, and they feel burdened with keeping old systems going.

The quality of staff members that managers often assign to these jobs — junior programmers or people with little chance of being promoted — reinforces the perception of low status.

In reality, these should be among the most important positions in an MIS organization. The maintenance group — more appropriately known as production support — repairs and enhances systems that are critical to the operation of the business. This group also supports management's need for information.

Keeping systems current

If an organization does not employ good people to keep its systems current and efficient, it can run into major operational disruptions.

To find the knowledgeable, experienced people who should be performing this role, MIS managers should look for DP workers who have the following traits:

- A business orientation and knowledge of company operations.
- Strong familiarity with the applications systems that need support.
- Problem-solving ability.
- A dedication to precision.

People with these traits tend to enjoy the rapid feedback that comes from solving users' operational problems. Managers should encourage any staff members who want to become involved with day-to-day business to try production support.

Identifying employees who have the personality and skills to excel in maintenance is not enough, however. To keep these experts happy, managers in MIS and user departments must take the following steps:

- Acknowledge maintenance workers' importance.
- Publicize their accomplishments.
- Offer them commendations.
- Compensate them handsomely.

Acknowledging importance. A positive attitude about production support starts at the top. MIS management should explicitly state the value of the maintenance function.

User management should consider support staff members to be an important part of its organization, as well, and should include them in staff meetings, planning sessions and discussions about operational changes. When they attend management meetings, capable production support people frequently make contributions that are worthy of recognition.

Publicizing accomplishments. Many shops ignore their production support staff members unless something goes wrong. This should not be the case; the maintenance staff must come to understand that its contributions are appreciated.

Offering commendations. Management should take advantage of every opportunity to recognize late-night or weekend calls, timely completion of new features or support for new products and smooth installation of releases. This recognition can take the form of public commendations, lunches and awards.

Compensating staff members. MIS managers should never compromise on the quality of people assigned to production support. To be able to hire and keep top-notch workers, managers must pay them well.

Marks is president of Poc-It Management Services, Inc., a Santa Monica, Calif.-based management consulting firm that specializes in information services. Strowbridge is vice-president of MIS for Dataproducts Corp., a printer manufacturer based in Woodland Hills, Calif.

ANALYST from SR/39

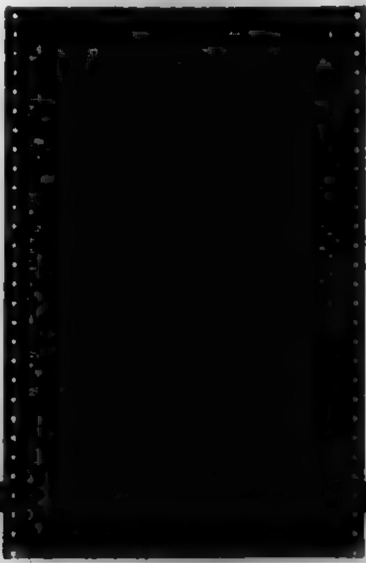
system. Are there periods of time when either the organization as a whole or a unit receives no information from outside? How long are these cycles? What happens if they are interrupted by unexpected input or by unexpected requests for output?

No unnecessary processing

The analyst who can evaluate these attributes of a system and can translate their findings into charts, data flow diagrams, data dictionaries and words clear enough to share and evaluate with users and management will succeed in the following two ways:

- He will produce applications free of the unnecessary duplication of record processing.
- He will avoid massive redundancy of data storage.

In addition, he will not select applications software that uses too much of a system's resources for the processes supported or software that loads the computer with an unnecessarily high overhead.



programming.

While doing research for their recent book,* James Martin and Carma McClure reviewed seventeen diagramming techniques and came to one overwhelming conclusion:

Action diagrams are the simplest and best method of representing structured programs.

Action diagrams combine graphic and narrative notations in a rigorous but easy-to-understand technique. The method is applicable to any size program. In almost any language.

When used to sketch out program logic, action diagrams encourage correct structured thinking. Logic errors become more apparent. Communication improves among programmers, analysts, and end users. And top-down design is enhanced, because action diagrams handle any level of logic, from systems overview to detailed program code.

Fast, full-screen editing with ACTION DIAGRAMMER™ and an IBM PC.

Working closely with James Martin, DDI has developed an action diagram editor for the IBM Personal Computer and 100% compatibles. The Action Diagrammer™ editor lets you create and update action diagrams right on the screen. You draw brackets with a single keystroke. Manipulate text with all the power of a visual editor. And expand or contract to focus on any level of detail you choose.

The net result: faster application development

With Action Diagrammer you can develop designs and programs faster, and with fewer errors. Maintenance is easier too, because Action Diagrammer enforces logic structure and provides excellent documentation.

The price is easy too — only $495

The Action Diagrammer software package sells for $495 and comes with a complete user guide, which includes a thorough overview of the action diagramming method. No serious programmer or analyst with access to an IBM PC or compatible should be without it.

Even more features

Represents logic hierarchy with nested brackets for all constructs such as sequence, selection, case, and repetition. Can also represent database actions and subprocedures

Automatically supplies control structure syntax in English, COBOL, PL/1, FORTRAN, C, Pascal, and many 4th generation languages including FOCUS, RAMIS, NOMAD, MANTIS, IDEAL, NATURAL, and ADS/O

Offers one-stroke commands and user programmable function keys

Shifts mainframe software development to PC's

Allows color coding of diagram sections through user control of text and bracket colors (for users who have a color monitor)

Includes ample help messages and other on-line documentation

Produces hard copy of action diagrams on any IBM PC-compatible printer. Graphic output on IBM graphics printer or HP7470A plotter

Short-shrifting design inflates maintenance costs

By Robert Todd
Special to CW

Nothing can replace hard, disciplined thinking as the ultimate means to increased productivity. Software aids, such as code generators, sophisticated data base management systems and query languages, are useful for certain functions but not for critiquing them.

In many companies, $100 worth of software money involved throughout the system life cycle is distributed as follows:

- Analysis — $15.
- Design and coding — $5.
- Testing and debugging — $20.
- Maintenance — $60.

These figures mean it costs more to fix a system after it is delivered than it does to deliver it in the first place, and half the cost of delivering a system is spent testing and debugging it.

The figures also show that if a 10% increase in design and coding can produce a 10% decrease in debugging and maintenance, the cost is 50 cents, but the benefit is $8.

Favorable cost/benefit ratio

Even if it required a 100% increase in design costs to achieve a 10% reduction in debugging and maintenance, the cost/benefit ratio would still be favorable. Doubling the design effort can cut by half the debugging and maintenance effort — surely a worthwhile effort.

These observations lead to the two primary goals of system design:

- First, to maximize the ease of modifying the system.
- Second, to maximize the ease of testing and debugging the system.

These goals show clearly that software productivity aids are useful for implementing a system and for making changes but are not particularly useful for designing the system in the first place. And that is where the beautiful systems are separated from the ugly ones. It is where good old-fashioned thinking shows up as the most fundamental productivity aid.

But what makes a system easy to modify and debug? How can the DP professional recognize a beautiful design, as opposed to an ugly one, and what hidden costs are likely to crop up in a highly maintainable design?

There are two elements involved in developing and maintaining a computerized system — the computer and the people who work with the system.

To a computer, everything is equally simple. A 10-line program in Baby Basic is as complex — or as simple — as a million-line system in undocumented Assembler. Complexity simply does not exist for a computer.

People, on the other hand, are severely affected by complexity. People can handle up to about seven different things at the same time with acceptable error rates.

Before a system can be modified, the modifier, or the programmer, has to understand the system, or at least the program, requiring modification. Understanding will come easier if the program is simple, clear, obvious, direct and without unnecessary considerations of machine or operating system peculiarities, coding eccentricities, obscure data names and so on.

Five design features are strongly related to ease of maintenance:

- Small module size.
- Modular independence.
- Black box characteristics.
- Conceptual modeling.

Todd is a senior systems analyst at Dictaphone Corp. in Bridgeport, Conn. He is a lecturer in systems analysis and design at the University of Bridgeport and a Ph.D. student at the Polytechnic Institute of New York in Brooklyn.

We develop scientific VAX applications faster with PowerHouse.

There's a new formula for developing scientific and engineering applications on VAX.

Keep FORTRAN or other 3rd-generation languages for your number-crunching routines. But use 4th-generation POWERHOUSE to front-end your FORTRAN program as a data manager and forms creator. Or use 4th-generation POWERHOUSE as your post-processing report writer.

The secret to this formula is that POWERHOUSE is designed specifically to support your RMS files.

That means POWERHOUSE can work side by side with FORTRAN, PASCAL, C or other computational languages, sharing the same data files. For each part of your application, you can use the language that's most appropriate.

Why write the data management parts in 3rd-generation FORTRAN, when you can work 10 to 100 times faster in 4th-generation POWERHOUSE.

And you can tie the application together neatly for your users with POWERHOUSE menus.

Ask for a POWERHOUSE demonstration today. Call 1-800-272-0068. (In Massachusetts, call 617-535-7350.) Or write Cognos, 2 Corporate Place, I-95, Peabody, MA 01960.

- Isolation of detail.

These five design features lie at the heart of structured design and lead directly to highly maintainable systems. They can be achieved with or without software productivity aids, although good aids are genuinely useful.

Structured methodology works not only because design features have been identified, but because techniques for measuring them have been developed. It is possible to apply uniform standards of measurement to any proposed system and thereby evaluate the quality of the proposed design. The yardsticks of system design evaluation embody the following concepts:

- Normalized file design.
- Coupling.
- Scope of effect and scope of control considerations.
- Packaging.

But first it is necessary to discuss the concept of efficiency, which is not on the list. Concern about efficiency — from a machine and/or operating system viewpoint — is the unspoken golden rule of programming. It goes without saying that all code should be tight, linear and, above all, make efficient use of machine resources.

The industry has matured to the point where business objectives are far more important than technical concerns. And business objectives are invariably tied to adaptability to change. That means that maintenance is the single most important function that programmers perform. If programmers cannot respond in a reasonable time to reasonable requests from businessmen to adapt to a changing environment, they are not earning their pay.

It follows then that systems should be designed for maintainability and that the best programmers should be primarily responsible for maintenance. In fact, no program should go into production without the blessing of the maintenance team.

If a DP department adopts the principles of structured design, which lead to more maintainable systems, what will be gained or lost?

First, the losses: Systems that are designed for maintainability are harder to develop. It takes more thought, effort and iterations on paper, or with a software design aid, before coding begins. That delays the beginning of system testing, but, somewhat paradoxically, hastens its completion.

Those who do not understand MIS are suspected of these activities. To endorse a methodology that pushes visible progress even further out on the project schedule takes a fair amount of courage, not to mention a considerable sales effort.

Performance loss

Systems designed with this methodology also lose some performance efficiency — about 10%, according to Yourdon, Inc. We lose a similar amount of memory usage with added overhead and, again, a similar amount of disk resources. To take this message to machine-oriented programmers also requires courage and a firm conviction that the longer view is of greater importance to the company — and to the department.

To summarize our losses, we must be willing to tackle the following issues:

- More difficult, disciplined and time-consuming design effort — and subsequent delay in starting testing.
- Program performance.
- Memory overhead.
- Disk resources.

If you pay this price, what will you buy? You'll buy a system built of independent modules whose single function is known or easily learned. You'll buy a self-documenting system, because it is fully designed before it is coded. You'll buy a system that is structured the same way the business problem is structured and the same way the data is structured. And, because of the preceding factors, you'll buy a system that is about twice as easy to maintain.

There is another consequence of the structured methodology. The laissez-faire approach to coding, in which each programmer is free to express himself as long as the program works, will be a casualty of structured design. As programming matures into software engineering, the artistic aspect becomes subjected to the constraints of guiding principles.

We develop commercial VAX applications faster with PowerHouse.®

More and more companies are recognizing VAX as a commercial computer.

Of course, it's not the hardware that makes a commercial machine. It's the software. And that software is the POWERHOUSE 4th-generation language.

POWERHOUSE is 10 to 100 times faster than 3rd-generation languages for developing commercial applications.

And POWERHOUSE stands up to the toughest commercial applications, not just information-center applications.

That's why POWERHOUSE is installed on more commercial minicomputers than any other 4th-generation language. And why it's used by more than 100 FORTUNE 500 companies.

Wherever you're going commercially with VAX, POWERHOUSE will take you there.

Open up your VAX to its full commercial potential. Ask for a demonstration of POWERHOUSE in your office today. Call 1-800-272-0068. (In Massachusetts, call 617-535-7350.)

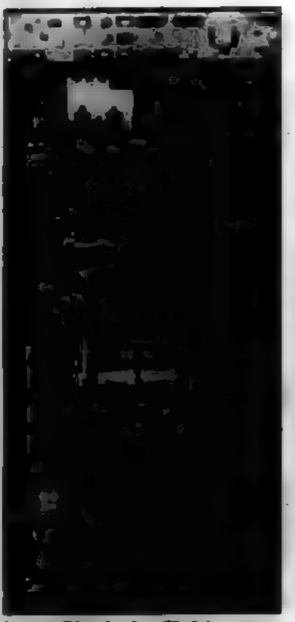
Special Report

Source code librarian conquers tight design deadline

GRAND RAPIDS, Mich. — During a project with deadlines so tight that development and maintenance overlapped, a programming team here relied on a software tool to prevent source code changes from undermining its efforts.

Programmers in the software tools section of Lear Siegler, Inc.'s Instrument Division used the tool to keep track of more than 13,000 code changes during a hectic attempt to design and build a flight management system for Boeing Commercial Aircraft Co.'s 737-300 passenger jet.



Lear Siegler's flight management system went from drawing board to cockpit in two years.

The system, which would eventually encompass 800 common blocks of code and 2,000 subroutines, was best suited to a three-year development schedule, according to Katherine Hornbach, manager of the software tools section.

However, Lear Siegler had just slightly more than two years in which to complete it: Boeing ordered the system in September 1982 and planned to have the aircraft carrying passengers by December 1984.

Given the time constraint and the size of the project, development and testing had to proceed simultaneously.

Lear Siegler staffed the project team with about 65 engineers — 20 software development engineers, 25 test engineers and 20 systems engineers — and scheduled them to work through two weekday shifts and weekends.

Software testers would be running subroutine builds while developers were designing upgraded versions of those same routines.

If the testers made changes to the code, they would have to be able to link those changes into the current development version.

"We couldn't afford to have source code control problems," Hornbach said. "We just couldn't afford to waste time because we linked in the wrong version." Such a coordination glitch could make software problems difficult to isolate and could stall the development project for weeks.

To keep on top of source code changes, Lear Siegler purchased Digital Equipment Corp.'s Code Management System, a source code library utility that controls access to code and keeps a record of changes that programmers make to it. The firm ran the software on an 8M-byte DEC VAX-11/782 under VMS, which programmers accessed through VT100 terminals.

The librarian stored one copy of the original source code. To make changes in any module during the development process, programmers at Lear Siegler checked a copy of the code out of the library. The code librarian recorded the transaction and kept track of who was using what module.

Once the programmers completed their work, they sent the module back to the library, where the code librarian assigned the changed module a generation number, noted the date of the transaction and asked for a description of any changes that had been made.

In the description, the programmer listed the number of the problem report filed about the change and gave reasons for altering the code.

Change incorporated into source code

The librarian then incorporated the change into the source code. Later in the project, when a programmer wanted to re-create any past version of a module, he asked the librarian for the specific generation number, and the librarian compiled the specified version.

Hornbach (above) said a tool that tracks source code played a key role in her team's speedy project completion.

Hornbach said the librarian provided Lear Siegler's development team with two important benefits:

- It kept track of the latest version of any subroutine. This ensured that testers never wasted time testing an obsolete version.
- It noted the generation statements that went into any given version of the source code. This helped testers link the proper versions of subsystems into any build they executed.

"All of a sudden we had complete control of our software," Hornbach said. "We know exactly what went on with each module. We have the entire history of the development of that software."

The only problem the team encountered was one of response time. During peak usage periods, the librarian took up to two minutes to fetch a subroutine, according to Hornbach.

She blamed the problem partly on the team's demanding pattern of use — Lear Siegler allowed heavier concurrent use than the VAX was designed to support — and partly on the librarian itself — the software tool's thoroughness accounted for much of the delay. DEC has improved response times in its most recent release of the tool, she said, and Lear Siegler has installed more VAX machines.

Other problems Hornbach expected, however, never materialized. She said she had worried that the source code library would take up too much disk space.

But the historical subroutine versions used less space than one clear copy of the source code.

She had also questioned the tool's reliability, but said it did not lose one line of code during the entire project.

On Nov. 14, 1984, the Federal Aviation Administration granted full certification to Boeing's 737-300, which included the Lear Siegler flight management system. The plane went into service, on schedule, during the first week of December 1984. The source code librarian played a key role in helping the development team meet its deadline, according to Hornbach.

She said other software — including fourth-generation prototyping tools, a problem report data base, a data dictionary and on-line documentation tools — also contributed to the team's success but stressed that without dedicated people, the project would have failed.

Tools, according to Hornbach, "were a necessary, but not a sufficient, condition for getting the project out."

POPLOG.

Where Artificial Intelligence Solves Real-World Problems.

Now you can dramatically reduce costs and create expert or knowledge-engineered systems more quickly and easily with POPLOG.

An integrated combination of languages, POPLOG is a fully-supported interactive AI development environment that runs on VAX(VMS), VAX-(UNIX), SUN II workstations and HP 9000/200 computers. Because it allows the most appropriate language to be used in a given situation (PROLOG, LISP AND POP-11), it provides incremental compilation facilities to promote fast prototyping. Routines can be written in PASCAL, C, FORTRAN, and ADA all of which can be linked into the POPLOG environment.

POPLOG contains an on-line support system and a powerful screen editor to provide a set of AI-based tools. Once you see how much power you can obtain for a fraction of the cost of other more complicated, hard-to-use systems, you'll want POPLOG.

For more details and our exclusive NO-RISK evaluation, call or write today. POPLOG is the artificial intelligence tool that solves real-world problems.

LIBERTY from SR/14

helped to write it.

Liberty Mutual's programming staff wanted to rewrite some of the code to make maintenance more efficient, according to Mike Nerney, assistant manager of systems and programming. But staff members had to devote most of their efforts to developing new programs instead. "We really needed to rewrite," Nerney said, "but we didn't have the staff time."

Despite the resource constraints, he said, Liberty Mutual almost decided to go ahead with some desperately needed rewrites. As the firm prepared to start the process, however, its staff members came across a software package, Group Operations, Inc.'s Superstructure conversion program, that they thought might help them.

'Programs in dire need of rewriting'

"We were in the process of identifying the programs that were in dire need of rewriting when we read an article about Superstructure," Nerney said. The firm decided to test the program to see if it could help defer the rewrites.

Liberty Mutual began testing late in 1983. In May 1984, it installed the conversion program on a 32M-byte IBM 3081. Programmers then started running the conversion program against their unstructured applications. By October, Mooney said, the programmers had restructured the 60 problem applications.

He said the conversion program made the applications' logic easier for programmers to follow. It eliminated interparagraph GOTOs and fallthroughs and removed ALTER statements and altered GOTOs. The program also organized the applications' code into modules, each consisting of a paragraph or a series of paragraphs that performed a discrete logical function.

To test the integrity of the restructured code, Liberty Mutual's DP staff compared output tapes from the original applications with tapes from the restructured ones. Mooney said output from the new code matched perfectly with output from the old code in every application.

No one has calculated how much maintenance time and expense the restructured code has saved the firm to date, but Mooney said programmers have assured him it has made their jobs easier. "The people who work on the programs day in and day out see improvements," he said.

Staff members have fewer problems understanding the logic in the applications, and run books and compiles are much cleaner than they were in the past, he said. Because programmers spend less time deciphering logic, they have more time to devote to development.

According to Nerney, the conversion program has also allowed the staff to keep running programs that otherwise would have required total rewrites. "We thought Superstructure might buy us some time, and it is doing that," he said. "It has helped us to defer the costly rewrite of at least 50 programs, without tying up programming resources needed elsewhere."

Nerney said Liberty Mutual will eventually rewrite many of the programs, but only to answer functional needs — not in response to maintenance problems. "Eventually, the existing versions are going to outlive their usefulness," he explained. "Then we can rewrite."

Besides using the conversion program on unstructured code, Liberty Mutual's programmers have experimented with running Superstructure against programs written under the firm's structured methodology. But Mooney said the results of the experiments were not dramatic.

Because most of the required restructuring is complete, the conversion program is no longer in heavy use. Liberty Mutual maintains it in a library, however, and programmers call for it when they have need, Mooney said.

CONTRACT from SR/44

be completed within a reasonable amount of time. Software maintenance contracts, however, rarely address the timeliness of a vendor's work.

To solve any software problem, a vendor must first respond to a request for assistance. Response varies among vendors: Some consider the logging of a user's telephone call as a response; others define a response as the assignment of personnel to solve a problem. If the user does not define — in writing — what constitutes a response, the vendor will make his own definition, and the definition is likely to vary over time to suit the vendor's work load.

In addition to defining response, the user organization should try to install in its contract a mechanism for expediting solutions. The MIS manager can establish a contractual time frame for a response, but any attempt to force a solution within a specific period is unrealistic. Some problems are more difficult to solve than others, and few vendors will promise to provide solutions within a given number of hours or days.

A user organization can, however, structure its software maintenance agreement so that the vendor has an incentive to fix problems. One way is to have the vendor promise to assign certain personnel to the problem after a specific period of time has passed; another is to have the vendor agree to send maintenance people to work at the user site until the problem is resolved. Such incentives do not guarantee a solution, but they increase the chances of finding one.

How to survive in times of abundance

It used to be that companies could go under if they didn't have enough management information. Now it's happening to companies that have more than they can handle.

Therein lies the problem. Data processing departments are swamped with work. Backlogs are swelling. Management expectations and end-user demands are not being met. In other words, your information system is out of control.

If you run an IBM OS or DOS operation, we can help you.

MANAGER SOFTWARE PRODUCTS INC has developed the first dictionary-driven family of tools designed specifically to help develop, manage and control an organization's entire data and information systems resource.

Right now, we offer four such tools: DATAMANAGER®, DESIGNMANAGER™, SOURCEMANAGER™ and CONTROLMANAGER™. They can be combined into a unique, fully integrated system. A system that will give you complete control of your IS operations today, and help you accommodate tomorrow's changing systems environment and end-user involvement.

msp

MANAGER SOFTWARE PRODUCTS INC

Offices worldwide: Australasia, Benelux, Canada, Italy, Japan, Scandinavia, Spain, Switzerland/Austria, U.K./Eire, U.S.A., West Germany.

MSP's MANAGER Family helps you model and document data structures and programs, and helps you design data base and file systems. Its powerful interrogation facilities enable you to produce accurate and timely reports.

And it provides your end-users with a plain English command language, on-line help and a sophisticated full screen interactive environment that can be tailored for each and every user.

MSP even has an application development system that actively generates programs from the dictionary — and guides your programmers to increased productivity through the re-use of existing source code.

And this is only the beginning.

MSP's information resource management tools truly are business survival tools. Find out more about them. Send the coupon today. Or call (617)863-5800.

Send me more information about MANAGER SOFTWARE PRODUCTS' family of integrated, dictionary-driven products:

SOFTWARE AG
Where the future
comes as no surprise.

E-N-T!

ADABAS does it again— and we're not surprised!

The results are in! Datapro Research Corporation asked systems software users to rate their data base management systems. And, Software AG users rated ADABAS "Excellent!"

Exactly the same thing happened in an earlier survey when Data Decisions asked users what they thought. For the third year in a row, ADABAS went right to the top of the list as the highest ranked DBMS for the IBM mainframe. And NATURAL was a top contender for best fourth-generation language.

Together, ADABAS and NATURAL make an unbeatable team!

At Software AG we don't believe in surprises. We believe in providing our users with the most powerful software tools available anywhere. And that's the proper plan for the world leader in advanced systems software.

So, if you want the facts about systems software, just ask our users. For starters, send us the coupon below and we'll rush you the official Datapro DBMS report. Or call us at 1-800-336-3761. (In Virginia and Canada, call 1-703-860-5050.)

OIL

from SR/40

the dictionary as a tool to complete the development effort, not as a repository for after-the-fact documentation of the completed system.

- The team wrote several data base applications that directly accessed the dictionary data as part of their processing. These programs provided a quality-control mechanism for the accuracy and currency of the dictionary data.
- Aramco took great care to ensure that anyone on the development team who served as a source for dictionary information received tangible benefits from using the dictionary in his part of the development process.

With these safeguards in effect, the project was successful. People from every part of the development group cooperated. In return, they all received some strong benefits.

Users. The user community, composed of engineers and geophysicists, was the ultimate source of information about business data and activities on which the data structure and applications would be based.

For every data element to be converted, users were assigned the task of entering into the dictionary a concise definition, units of measurement, encoding schemes, reporting precision and business-based editing rules.

In return for this arduous effort, the user community gained many important benefits. The completed dictionary would provide ready-made documentation of the system, a valuable aid in the formulation of ad-hoc queries. Dictionary-driven reporting software printed tables with prestored headings, element-based reporting precision and value decoding, thereby reducing dependence on the DP staff for the development of simple applications.

Most importantly, the user community achieved a significant degree of control over the content and structure of data in the resultant system.

Logical designers. The logical design team added information about data base structure into the data dictionary. Team members grouped data elements into records and subject data bases, identified logical keys for each record and defined important inter-record relationships and structure-based editing rules.

They were able to use the user-generated definitions in their data analysis efforts. In addition, several dictionary applications were written to aid the logical design process. Reports were generated that showed proposed record layouts in each phase of data normalization. Structure charts depicting inter-record relationships were generated directly from the data dictionary to serve as road maps for data navigation.

Physical designers. The physical design team added information about size and estimated number of occurrences of each record and data element. It also modified the logical structure where necessary to improve performance.

The physical designers were able to use the dictionary information that had already been entered by the logical designers, modifying it to reflect the physical tuning. They then used the Dictionary/204 system to generate the data definition statements necessary to build the physical data base.

System analysts. The system analysis group designed the dictionary software enhancements as well as the data conversion software and data base applications. Group members used the data dictionary to describe conversion algorithms, defining a source for each target data element in the new data base.

The system analysis group enjoyed many benefits from the dictionary. The data elements, records and structures previously defined reduced the time required to design and document the data base applications. In addition, it now became possible to design dictionary-driven generic systems.

One design effort, for example, included the development of a generic update system that would update any data base record based solely on data in the incoming transaction and the information on data structure and editing rules previously stored in the data dictionary. This generic process eliminated the need to develop hundreds of update modules, one for each record in the data base.

Programmers. The programming team developed the programs that extended the dictionary function to meet the needs of the other groups. Programmers also entered into the data dictionary information about which data elements and records were used in each program developed.

In return, the programmers were freed from a great deal of trivial coding. Code generators were written to generate record descriptions in the PL/I and SAS languages in a manner that allowed the descriptions to be included directly in an application program.

Data administrators. The data administration group was responsible for overall dictionary maintenance and development. Administrators developed standards for data element names, units of measurement and reporting precision and generated quality control software to validate the meta data in the data dictionary.

The data administration team used the dictionary to make impact analyses (for example, What programs will be affected if we change this data element?) and to facilitate development of data standards. Team members generated comparison reports, for example, that showed the units and precision for each data element of a general type.

Compuware Case #2

(You and)
File-AID
vs.
The "Quick Fix"

Exhibit A.
The Sore Fingers.

Don't make a federal case out of handling data.
Are you tired of "Quick Fixes" that come back to haunt you later? Put them away for a long term cure with File-AID, from Compuware. It's the one software package which allows fast, easy and secure data handling without programming—regardless of your access method or file organization.
Why argue with the facts?
Compuware File-AID is available in BATCH and also as an extension of the ISPF environment. And you'll appreciate how it consolidates the most commonly used file and record handling functions into one, easy-to-learn, simple-to-use package. So you can expect to improve your total system—and eliminate your frustration—right from the start.
Proven beyond a reasonable doubt.
Compuware File-AID eliminates the confusion and maintenance costs associated with having several

unrelated utilities in your installation. And you'll realize the cost-savings right away. Compuware File-AID's effectiveness can be seen immediately, in all areas of data processing: application programming, systems programming and in operations. And it will go on to prove itself everyday.
You be the judge.
Give Compuware File-AID a fair trial for 30 days, free of charge, and enjoy the savings of time, money and effort. You'll never need "Quick Fixes" again! Call 1-313-540-0400 today, and Compuware will take it from there.
With Compuware File-AID on the case of the "Quick Fix," you can be a winner every time.

MICROCOMPUTERS

Aion offers AI development system

LOS ANGELES — An expert system development environment that runs on IBM Personal Computers and is targeted at solving well-understood problems was introduced last week by Aion Corp. at the International Joint Conference on Artificial Intelligence here.

Aion's Application Development System/Personal Computer (ADS/PC) is designed to permit experts who lack artificial intelligence training to create expert systems, according to Aion President Harry Reinstein. Priced at $7,000 and scheduled for commercial availability Oct. 15, ADS/PC is aimed at use within traditional DP environments.

Likely candidates are systems that can be implemented in less than six months that would have been done anyway without expert systems but that require judgment rather than mathematical computation alone and that can benefit a number of employees whose current job performance varies widely, Reinstein said.

ADS/PC consists of two parts, an Application Building System that includes the development functions required to create text and run knowledge-based systems and a runtime Application Execution System.

The Application Building System, which requires 512K bytes of internal memory, reportedly contains a set of intelligent editors. Each editor shows users a screen, allowing them to select various options, such as creating or modifying an object. The editors include Help facilities and semantic and syntax checkers. Aids for verifying and analyzing the completed knowledge base also are built in.

The Application Execution System, which requires 320K bytes of memory, interacts with the end user, directing a dialog with the user and providing Help functions and explanations of system conclusions.

Written in Pascal, ADS/PC offers subsecond response time to questions on a standard Personal Computer, with disk I/O the biggest limitation on performance, Reinstein said.

Aion also will develop software for other IBM machines, with a version for IBM 370 mainframes scheduled for delivery in first-quarter 1986, Reinstein said.

The company plans to sell to both software developers and MIS departments. "We're a little more focused on the DP/MIS environment than when we started," Reinstein commented. In each case, Aion said it expects to work closely with its customers, providing consulting and training services, with the overall cost of products and assistance typically ranging from $100,000 to $500,000.

"In any new technology, one can build excellent products the first time, but they are almost always not perfect," he said. "We want to stay very close to the people who are building the initial products."

Founded in May 1984, Aion received $2.4 million in venture funding last February.

The company is located on the Fourth Floor of 101 University Ave., Palo Alto, Calif. 94301.

Slow DSS sales laid to lack of user knowledge

SMALL TALK
Eric Bender
CW Senior Editor

Although the Lightyear, Inc. Lightyear decision modeling software earned mostly good reviews and received a lot of press attention, only 3,000 copies have sold since the package, designed for the IBM Personal Computer, debuted last November.

What barriers did Lightyear face, and what do they mean for innovative microcomputer software in general?

Chris Christiansen of the Boston-based Yankee Group, who calls Lightyear "a great little program," feels that the biggest holdup was in education. "They didn't have the money to educate the public on what kind of decision support system [DSS] it really was," Christiansen said. "It basically was a tool that very few people knew how to use effectively. Very few people had enough imagination to know what to do with it."

Terry Garnett, Lightyear's founder and chairman, agreed, drawing an analogy to micro spreadsheets, which have been around since 1978. "The calculator really set the stage for spreadsheets," with thousands of people familiar with Hewlett-Packard Co.-style calculators making a natural progression into spreadsheets, he said.

But DSS software has lacked that kind of metaphor, he maintained. "This category is so new that it will take a while to develop. The barrier is more time than anything else."

While Lightyear often is described as a decision-making tool, that's misleading, because it makes decisions no more "than a word processor will write a book for you," Garnett said. Instead, it's aimed at examining explicit reasoning for decisions — a task often now addressed via spreadsheet.

Another slowdown came in marketing

Visage boosts V:Station videodisk line

Adds icon-oriented V:Tools for applications development

NATICK, Mass. — Visage, Inc. has enhanced its V:Station series of interactive videodisk systems to include V:Tools, an icon-oriented software package for applications development. The V:Stations are IBM-compatible personal computers that interface with a videodisk player to provide an interactive video system for training, sales and other uses.

V:Tools includes a program simulation tool that reportedly permits users to model video program segments interactively before coding them and a color graphics program for use with high-resolution displays.

The software package also features a variety of utilities for file management, zone creation and system configuration. A palette creation utility permits users to chose a 16-color palette from a choice of 4,096 colors, Visage said.

V:Tools will be bundled with V:Stations beginning in October and will run under V:Exec 2.5, the V:Station's systems software, Visage said. The development software will also be made available to current V:Station users at a cost of between $200 and $300, Visage said.

Also introduced were an upper end to the V:Station line, the V:Station 2080, and the V:Link 1580 upgrade package for use in converting a machine in the IBM Personal Computer line into a videodisk controller.

The V:Station 2080 is based on a personal computer that is said to be compatible with the IBM Personal Computer AT and includes a monitor, system software, a videodisk player and a choice of authoring languages and input options.

Both the V:Station 2080, priced from $9,000 to $15,000 depending on options, and the V:Link 1580 upgrade packages, costing from $3,500 to $6,000, will be available in October and will support high-resolution, 640- by 400-pixel graphics, Visage said.

At the same time, Visage announced support for still-frame audio products from both Laserdata, Inc. and Eeco, Inc. that reportedly permit users to incorporate segments of continuing audio and "frozen" video in the programs they develop on V:Stations.

Products to create still-frame audio program segments are available currently from both vendors, Visage said.

Visage is located at 12 Michigan Ave., Natick, Mass. 01760.

Iomega rolls out storage systems

ROY, Utah — Iomega Corp. has introduced a line of half-height storage systems for use with the IBM Personal Computer line and compatible machines.

All of the products use the technology pioneered by Iomega in its Bernoulli Box line, which uses a pressurized stream of air to spin the disk media. The technology reportedly prevents head crashes. The products are offered in 10M-byte and 20M-byte capacities and single- or dual-drive configurations, Iomega said. Like the original Bernoulli Box, the products use removable media. Iomega said that 20M-byte cartridges will be made available for the new 20M-byte drives only. The Bernoulli Box itself uses 10M-byte cartridges.

A single-drive unit reportedly measures 6.32 in. high by 12.6 in. wide by 15.25 in. deep, or roughly half the size of the Bernoulli Box.

The 10M-byte Bernoulli 10 (B), a single drive, costs $2,695. The 20M-byte Bernoulli 10+10, a dual drive, is priced at $3,695. The 20M-byte Bernoulli 20 (B), a single drive, is $3,295. The 40M-byte Bernoulli 20+20, a dual drive, is $4,495.

More information is available from Iomega, 1821 4000 South St., Roy, Utah 84067.

Datacopy offers Fastore archiving tool

MOUNTAIN VIEW, Calif. — Datacopy Corp. here has introduced a high-speed image scanning and storage device designed for use in digitizing and electronically storing documents.

The Fastore system reportedly will permit the archiving of historical documents, engineering drawings, maps, handwritten forms and other papers.

The unit incorporates Datacopy's Electronic Digitizing Camera and display system and runs in conjunction with a host IBM Personal Computer XT or AT, which is not included in the price of Fastore.

The system can scan a document page in less than three seconds, according to Datacopy.

Once scanned, the document is compressed. A document page of up to 11 in. by 22 in. requires 50K to 100K bytes of storage, Datacopy said.

The digitized documents are stored on the host's hard disk, and the hard disk can be backed up, permitting extensive archivals. The Smithsonian Institution reportedly uses Fastore to archive its document library.

Images captured and stored by Fastore can be displayed at high resolutions, Datacopy said. A resolution of 200 dot/in. is achieved when an 8¼- by 11-in. document is displayed using Fastore.

The host Personal Computer can be used to annotate document files and pages. The text annotations can, like the rest of a file, later be searched on the basis of keywords, authors and document names.

Fastore, which also includes a high-resolution display and controller and software, is priced at $44,500. It uses the Priam Corp. Datatower mass storage system, which is not included.

The Datatower units come in two versions — a 160M-byte unit priced at $9,995 and a 290M-byte unit that costs $12,995.

Datacopy is located at 1215 Terra Bella Ave., Mountain View, Calif. 94043.

WHAT TO WARE TO SURVIVE THE HIGH SEAS OF BANKING

Ware something extraordinary. Ware INFOPOINT™ banking software by UCCEL. The most complete, most proven line of integrated financial software on the market. The software that keeps you cool in calm waters no matter how turbulent the market gets.

With INFOPOINT's 21 major applications, you'll not only survive — you'll survive in high style. And continue to grow and prosper — even while others are going under. What's more, INFOPOINT costs less than ordinary software and can be implemented in less time.

Survive the high seas of banking in high style. Call UCCEL now at 1-800-UCC-1234.

INFOPOINT BY
UCCEL
Banking software that makes you look good.

GTE starts home micro call service

RESTON, Va. — GTE Telenet Communications Corp. has announced a service under which home users of personal computers will be able to pay a flat fee of $25 per month to use the Telenet packet-switched public data network to call other personal computers anywhere in the U.S.

PC Pursuit reportedly will permit users to conduct real-time communications, including file sharing, with other personal computer users or electronic bulletin boards, GTE Telenet said. However, it will be available for use only during evenings and on weekends and, at present, only in certain cities. These include Atlanta, Boston, Chicago, Dallas, Denver, Detroit, Houston, Los Angeles, New York, Philadelphia, San Francisco and Washington, D.C.

PC Pursuit reportedly will permit users to call any modem's telephone number, including those of nonsubscribers, as long as the modem being called is in any city served by PC Pursuit. PC Pursuit does not support 2,400 bit/sec. modems or spoken communication.

GTE Telenet said the service, which requires users to have their own modems and software for asynchronous communications, could save them up to 75% of their current long-distance charges. Users will dial their local Telenet access number and enter their home phone number and a destination phone number to access the service. If the user's home phone number is valid, they will be called back and connected to the number they were trying to reach, GTE Telenet said.

GTE Telenet is located at 12490 Sunrise Valley Drive, Reston, Va. 22096.

Meet to feature DBMS display

DEKALB, Ill. — Next month's Entity-Relationship Conference in Chicago will feature a micro data base management software competition in which a small number of vendors will demonstrate how their products handle a case study involving personnel data.

Attendees will be able to see inexpensively a large portion of a project life cycle beginning with data base specifications, according to session chairman Rodney Zimmerman. Specifications will be written in terms of entity-relationship diagrams, a graphics documentation technique that is rapidily spreading among Fortune 500 data base professionals, he added. The session will compare solutions in terms of several factors.

The session is scheduled for 7:30 p.m. on Oct. 29 at the Chicago O'Hare Airport Hyatt Hotel.

More information is available from Kathi Davis, Computer Science Department, Northern Illinois University, DeKalb, Ill. 60115.

SPECIAL REPORT

Minis and Small Business Systems

September 30

The September 30th Special Report will take a close look at the minicomputer and small business systems market. We'll discuss the latest trends in minicomputer architectures and examine the evolving supermini market. And we'll cover what's happening in the supermicro market and how it's affecting the mini market. We'll include reports from users on the problems that they encounter in selecting and implementing minicomputer systems and the solutions they discovered.

Computerworld's user subscribers are heavily involved in the purchase of computer systems —82% make purchase decisions for minicomputers and 84% are involved with the purchasing of small business systems for their organizations.

If you want to reach Computerworld's audience of 687,000 computer-involved professionals with information about your superminis, minis, supermicros or small business systems and any related products or services, this is the place to be. Computerworld's Special Report on Minis and Small Business Systems.

Reserve your space for the September 30th issue today. Simply fill out the coupon below and drop it in the mail. Or call Ed Marecki, Vice President/Sales, at (617)879-0700 or your local sales office. But hurry, the closing is September 13th.

Advertising close: September 13

☐ Yes, I want to reach buyers of minicomputers, small business systems and related products or services. Reserve space for my ad in the September 30th Special Report issue.
☐ I'd like information about Computerworld's upcoming Special Reports. Please send me your rate card.
☐ Please have a sales representative call me.

Announcing Masterpiece™ A Powerful Mainframe Application Software Product Built Upon A Simple Idea Called Intelligent Architecture™

What do you call a mainframe application software product designed with such patient attention to detail that it will register the effects of one transaction on every other business transaction in a company?

What do you call software architecture so artfully conceived it will someday enable a person using an application to move from one database management system to another, or from one teleprocessing monitor to another, without a single change in his work style?

What do you call query and reporting tools so simply and powerfully rendered that even a novice will find them no more difficult to work with than a personal computer spreadsheet?

Only one name fits…

Introducing Masterpiece.

The Masterpiece series is a family of mainframe business software products—a classification and a category which may lead you to conclude that it is like other mainframe software products.

Don't leap to that conclusion.

The Masterpiece design is so clean and uncluttered that it makes current and future applications efficient to develop and easy to use. Masterpiece comes with none of the excess baggage, inherent short-comings or system limitations that have traditionally plagued the people who need business information and the people who manage it.

Masterpiece is, in every aspect, a new family of software products.

And, in every aspect, an *improvement* over the software packages you may be used to.

Or are, in fact, now using.

Intelligent Architecture Design: The Fundamental Difference.

Previous software designs have been developed to better utilize the power of the computer.

Masterpiece was designed to mirror the methods and styles of the work place and to anticipate the *inadequacies* of the computer.

Masterpiece design is called Intelligent Architecture. It's a new term. And a new way to build software. Now, Intelligent Architecture brings new meaning to concepts like "modularity," "borderless integration" and "event-oriented processing."

Only application-specific code is contained in the application…other coding (system code, interfaces, code common to multiple applications) is separated out and coordinated by the Intelligent Architecture itself.

This means that ultimately a user can adopt a new database management system without the slightest change in either his way of working or in the application code itself.

Only software built in this manner, is software that will endure.

The Intelligent Architecture design means that all menus and screen prompts become common to all Masterpiece applications. It means that the way users interact with an application will be the same from application to application—a significant factor contributing to greater ease-of-learning and ease-of-use.

It is this capacity, present now in the Masterpiece Intelligent Architecture design, that lifts Masterpiece beyond the promise of other software products in its class.

And *that* is the fundamental difference.

maste

Masterpiece is a trademark of Software International Corporation. Intelligent Architecture is a trademark of Software International Corporation. MasterQuery is a trademark of Software International Corporation. MasterSecurity is a trademark of Software International Corporation.

Masterpiece: Common Functions.

The reason Masterpiece works so well is because each of its pieces work so well together.

And apart.

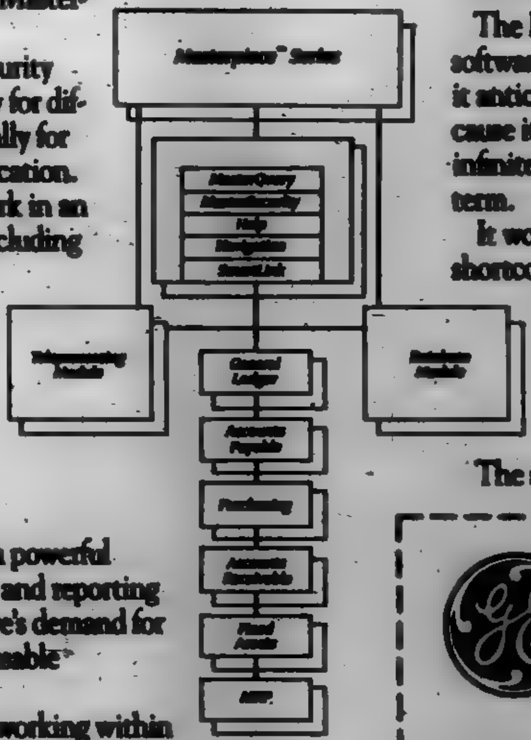
The MasterSecurity™ system, Online Help and Navigation features work across (and are common to) all Masterpiece applications.

But because they are separate from all applications, Online Help, for example, can be custom modified or even translated into different languages.

The Navigation feature lets you move from screen to screen with direct access from one Masterpiece application to another.

Levels within the MasterSecurity system can be determined not only for different applications but set specifically for transactions within the same application.

Everything is designed to work in an intelligent and modular fashion including what may now be the industry's most advanced query tool… MasterQuery.™



MasterQuery System.

The MasterQuery system is a powerful fourth generation borderless query and reporting tool designed to satisfy an executive's demand for instantly accessible and instantly usable information.

MasterQuery gives a person working within one application the ability to access information from another (accounts payable while working on general ledger, for instance) and to merge information from separate applications in a single report.

It also gives that person the ability to arrange his information in whatever form, format, or fashion he chooses. In whatever sequence or order. With whatever computations or projections he wants to make. With only the barest bit of computer know-how.

Masterpiece Integrated Applications.

The Masterpiece series will include these fully integrated, functionally rich business applications: General Ledger, Accounts Payable, Purchasing, Accounts Receivable, Fixed Asset Accounting, and MRP software products.

Masterpiece: The Promise The Future Holds.

The Masterpiece series is truly "built from the ground up" software. Because its architecture is so well thought through it anticipates future enhancements and applications. Because it's a product designed to be completely modular and infinitely improveable it represents a real value over the long term.

It won't, in short, fall prey to technological or design shortcomings. Won't dead-end at some point. Won't fail to perform as your needs expand.

For a Masterpiece demonstration, clip the coupon below or call toll free 1-800-343-4133 (in Massachusetts, call 1-800-322-0491) and arrange to attend a Masterpiece executive briefing.

The sooner you call, the further ahead you'll be.

SOFTWARE

■ United Software Security, Inc. has added a backup program to its product line.

Taketwo backs up hard disk data stored on an IBM Personal Computer XT or AT. The product copies only those files that have been added or changed during a day rather than copying all data on a hard disk, according to the vendor.

The package supplies security features for access and control of backed up files.

Taketwo sells for $1,400.

United Software Security, 6867 Elm St., McLean, Va. 22101.

■ Zedcor, Inc. has enhanced ZBasic 2, a programming language that runs on the IBM Personal Computer line, on Apple Computer, Inc.'s Apple IIe, Apple IIc and Macintosh and on microcomputers with Digital Research, Inc.'s CP/M operating system 2.2 or higher.

The language uses the same commands regardless of the type of microcomputer. The programming language features device-independent graphics, up to 54-digit numeric accuracy, a built-in interactive editor, a compiler and a choice of alphanumeric labels or line numbers.

Zbasic works at speeds up to 50% faster than other programming languages, according to the vendor.

The package costs $89.95.

Zedcor, 3438 N. Country Club, Tucson, Ariz. 85716.

■ California Computer Products, Inc. has introduced Cadvance, a computer-aided design package for use on a IBM Personal Computer XT or AT using a graphics display board and a minimum of 512K bytes of random-access memory.

Cadvance reportedly employs variable interpretive macros to save time in repetitive design. It also offers nested commands, which reduce the number of times a user must switch between menu selections, the vendor said.

The software reportedly offers the capability to zoom in or out, window and pan short, long or by page without leaving the draw command. While in the draw command, the user can change grids, move or float grids, view a fit and do other functions, according to the vendor.

Cadvance is priced at $2,500.

Calcomp, 2411 W. La Palma Ave., Anaheim, Calif. 92801.

■ David L. Aldridge Co. has introduced Precursor, indexing software for the hard disks of the IBM Personal Computer XT and compatible machines.

Precursor reportedly eliminates the need to remember DOS commands when accessing programs on a hard disk. The package, which resides in 50K bytes of memory, presents users with an index of applications on the disk and permits users to call up applications by pressing one key, the vendor said.

Included in the software are printer setup selections and three levels of password protection.

Precursor is priced at $69.

David L. Aldridge, 341 Town & Country Village, Houston, Texas 77024.

■ Network Software Associates, Inc. has introduced Adaptsna Remote Job Entry/Automatic Processing Facility (RJE/APF) software for use with the IBM Personal Computer.

Adaptsna RJE/APF reportedly permits automatic, on-the-fly post-processing and reformatting of data transmitted from a mainframe to a Personal Computer.

It also is said to allow a remote Personal Computer to function as an intelligent RJE workstation on which users can automatically determine how to reformat or modify downloaded mainframe data.

The software is priced at $870, the vendor said.

Network Software Associates, 19491 Sierra Soto, Irvine, Calif. 92715.

See TOOLS page 61

Package enables Modula-2 users to access Lotus 1-2-3

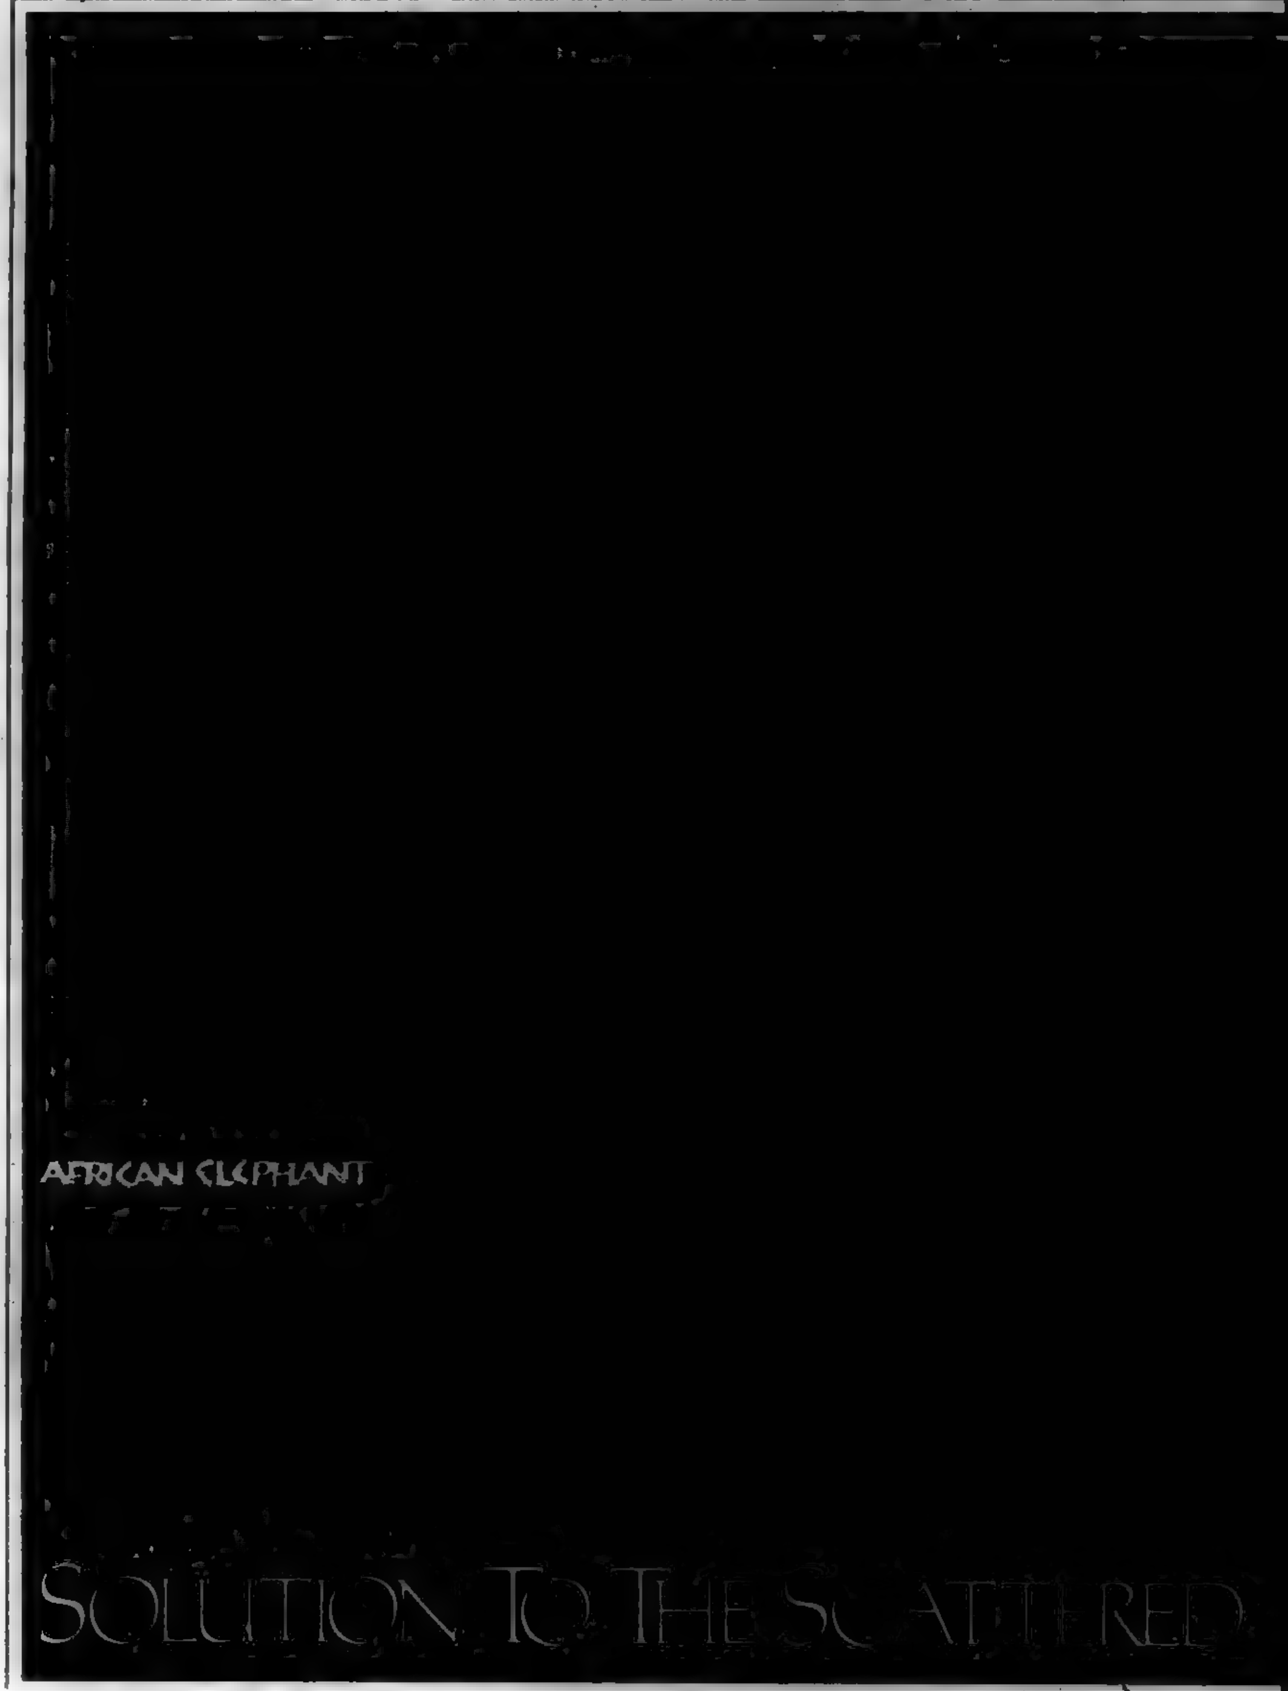
HOUSTON — Interface Technologies Corp. earlier this month introduced M2access, a $49 package designed for Modula-2 programmers that permits them to read and access Lotus Development Corp. 1-2-3 files directly.

IBM Personal Computer users who work with the Modula-2 language now can access 1-2-3 files without having to construct macros and without having to run under the 1-2-3 spreadsheet, according to Interface Technologies' President Robert Warfield.

"People can write add-on programs to 1-2-3 to do custom report generation, file manipulation and improved business graphics," Warfield said.

In addition to being available as a stand-alone product, M2access will be bundled in with sales of the company's M2SDS-XP software development system or Modula-2 Extended Libraries software until Sept. 30, the vendor said.

More information on M2access is available from Interface Technologies, which is located in Suite 200, 3336 Richmond Ave., Houston, Texas 77098.



TOOLS

from page 60

■ The Institute for Scientific Analysis, Inc. has introduced Small-X, an interpreter program for use in artificial intelligence programming on the IBM Personal Computer.

Small-X reportedly includes a programming language that combines a simple syntax with the tests and actions needed for the development of rule-based expert systems. It includes the ability to control and exchange data with other Microsoft Corp. MS-DOS-based applications, the vendor said.

The software requires 128K bytes of memory and costs $249. A manual, several example expert systems and a demonstration script are included.

Institute for Scientific Analysis, Suite 106A, 36 E. Baltimore Pike, Media, Pa. 19063.

■ Financial Decision Systems, Inc. has announced an enhanced version of its Corptax Linx tax reporting software for the IBM Personal Computer, Personal Computer XT and Personal Computer AT.

Version 2 reportedly allows users to customize reports in single-column, multicolumn and book-to-tax trial balance forms. It includes additional capabilities for consolidations, deletions and disk management and also includes the ability to convert data into general ledger format.

Version 2 requires a hard disk, a minimum of 512K bytes of random-access memory and a printer.

Cost of the software is $2,000. Users of Corptax Linx Version 1 may upgrade for $350.

Financial Decision Systems, 26035 Dorothy Drive, Agoura, Calif. 91301.

■ BST Consultants, Inc. has announced that its Management Information System software for professional design firms and other project-oriented firms is available on Digital Equipment Corp.'s Microvax II running under DEC's MicroVMS operating system and on the IBM Personal Computer AT running under Microsoft Corp.'s MS-DOS operating system.

The system is said to combine functional and organizational accounting and financial management in a multiuser integrated package. The functions include project control, billing, payroll and general accounting functions.

The system costs $12,500 for the Personal Computer AT version and $20,000 for the Microvax II version.

BST Consultants, P.O. Box 23425, Gunn Highway, Tampa, Fla. 33622.

■ Infocode, Inc. has introduced Infolok security software for the IBM Personal Computer and compatibles.

Infolok reportedly encrypts data using a passkey of up to 64 characters. Its functions include encryption and decryption, file purging, teleformatting and file hiding and finding.

Teleformatting capability is said to allow the software to convert a standard or encrypted file into transmittable Ascii format and to encrypt and transmit simultaneously using a single command.

Infolok is priced at $149.

Infocode, 19 Union Square W., New York, N.Y. 10003.

■ California Software Products, Inc. has introduced its Backrest software option for its Baby/34 and Baby/36 software products, which emulate the IBM System/34 and System/36, respectively, on the IBM Personal Computer.

Backrest, a software module, reportedly uses an incremental backup feature that indicates changes made to data during a specific period and backs up only the changes. The package also has an automatic formatting feature and indicates how many diskettes are needed for the backup.

Backrest is priced at $390 for Baby/34 and Baby/36 customers. It will also be sold as a stand-alone product for $350.

California Software Products, Suite 300, 525 N. Cabrillo Park Drive, Santa Ana, Calif. 92701.

■ Decision Resources, Inc. has introduced Diagram-Master software for the production of diagrams on the IBM Personal Computer.

Diagram-Master reportedly is a prompt-driven application able to produce organizational and Gantt charts as well as custom free-form diagrams, such as flow charts. A vector graphics package, the software interfaces with a variety of output devices including pen plotters, printers and the Polaroid Corp. Palette 35mm slidemaker.

When creating an organizational chart, users reportedly can include up to 70 boxes with up to six lines of text per box.

Diagram-Master is priced at $345.

Decision Resources, 25 Sylvan Road S., Westport, Conn. 06880.

■ Rand McNally Infomap, Inc. has introduced Randmap mapping software for the IBM Personal Computer.

Randmap reportedly permits maps to be created by state, county, Standard Metropolitan Statistical Area, three- and five-digit Zip code areas, congressional districts and other means. The package also features

Ordinary computer systems take a very narrow view of your world.

The extraordinary MAPPER® System puts things in true perspective.

Ordinary computer systems see you and your special business problems the way their programs tell them to. Which means they can't see things quite right.

That's because computer programs are either off-the-shelf—designed for some mythical "typical" business. Or they're custom-designed—created by an outsider who's unlikely to have a complete picture of your business.

But meet the Sperry MAPPER System.

It's truly an extension of your mind. Instead of confining you to any fixed program, MAPPER gives you carte blanche to create your own programs. Without doing any programming, in the conventional sense.

As a result, you gain unheard-of power. To make the computer see the full scope of your real world, and deal with it realistically.

MAPPER adapts to the way you work.

You and your people don't have to be computer experts to use MAPPER expertly. Far from it. Simple but powerful English commands get you what you want. A word or two is usually enough.

As you insert and extract information, freed from rigid procedures, you create your program along the way. So you can make mistakes. Change your mind. Even alter your destination in mid-journey.

MAPPER does more than work the way you work. It actually follows the way you think.

MAPPER can serve a handful. Or handle a thousand.

The MAPPER System can be scaled for a major corporation, for a single department, or for a growing business. You can even timeshare through a Sperry service bureau.

So no matter what size your business, the power of MAPPER is affordable. In fact, it can cost as little as a network of ordinary personal computers.

Come see MAPPER in action—hands-on, at a nearby Sperry Productivity Center. Phone toll-free. **800-547-8362** Or send us the coupon.

to large companies, which account for at least three-quarters of Lightyear shipments but take a long time in evaluation.

Financing the Santa Clara, Calif., start-up brought other problems. Last summer, Lightyear tried to tap venture capital, but "the market was just absolutely atrocious for raising capital, as it still is," Garnett said. Interested venture capitalists typically wanted Lightyear to merge with another software firm, which Garnett thinks would have wasted time.

The firm raised more than a million dollars privately, got the product out the door, hit a break-even point in January and has been marginally profitable ever since. While it was in no danger of closing its doors, the principles did worry about Lightyear's vulnerability to a few months of bad sales.

Snags cropped up

Snags in distribution also cropped up. "The distribution channel may be turned off right now," with distributors and dealers accustomed to products selling in large quantities, Garnett commented.

Dealer sales personnel may have little incentive to push new packages because customers often end up placing their volume orders with wholesalers. "We did everything we could to keep it out of the gray market," Garnett said. But there's a catch-22 involved because vendors seek to make their products widely available.

Through the first half of this year, Lightyear continued to examine options for raising bucks to continue the struggle.

Two months ago at a Future Computing, Inc. conference, I asked Garnett and Thoughtware, Inc. President Jack Levine an industry-standard question — are you guys buying anyone, or is anyone buying you?

There was no need for acquisitions from a product point of view, because "you can license anything you want," Levine said. But Garnett remarked that "there's so much chaos in the market now, everyone's talking to everyone."

In fact, the two began talking at the conference, and earlier this month they announced plans for Miami-based Thoughtware to acquire Lightyear.

Thoughtware's Trigger management package faces many of the same obstacles as Lightyear, Garnett said, and "it's a very good merger for both sides."

dot-density mapping and the ability to specify map boundary colors and text colors, according to Rand McNally Infomap.

Eight color boards, 11 plotters and eight mice are supported, Rand McNally Infomap said.

Randmap is priced at $995, according to the vendor.

Rand McNally Infomap, P.O. Box 7600, Chicago, Ill. 60680.

■ Felton Engineering Ltd. has announced computer-aided design and drafting software for the IBM Personal Computer, Personal Computer XT and Personal Computer AT.

Ecad is said to feature cursor-driven panning and instant zooms, regardless of the complexity of the drawing. Line thickness and patterns are displayed on the screen as they are on the plotted drawing. The software reportedly sorts and plots the lines of each thickness consecutively.

The software requires a minimum of 640K bytes of memory, an Intel Corp. 8087 math coprocessor, a Hercules Computer Technology, Inc. Monochrome Graphics Card, a Houston Instruments DMP series plotter and the IBM PC-DOS operating system.

The cost of Ecad is $2,195.

Felton Engineering, 3991 Smuggler's Cove Road, Victoria, B.C., Canada V8N 4M1.

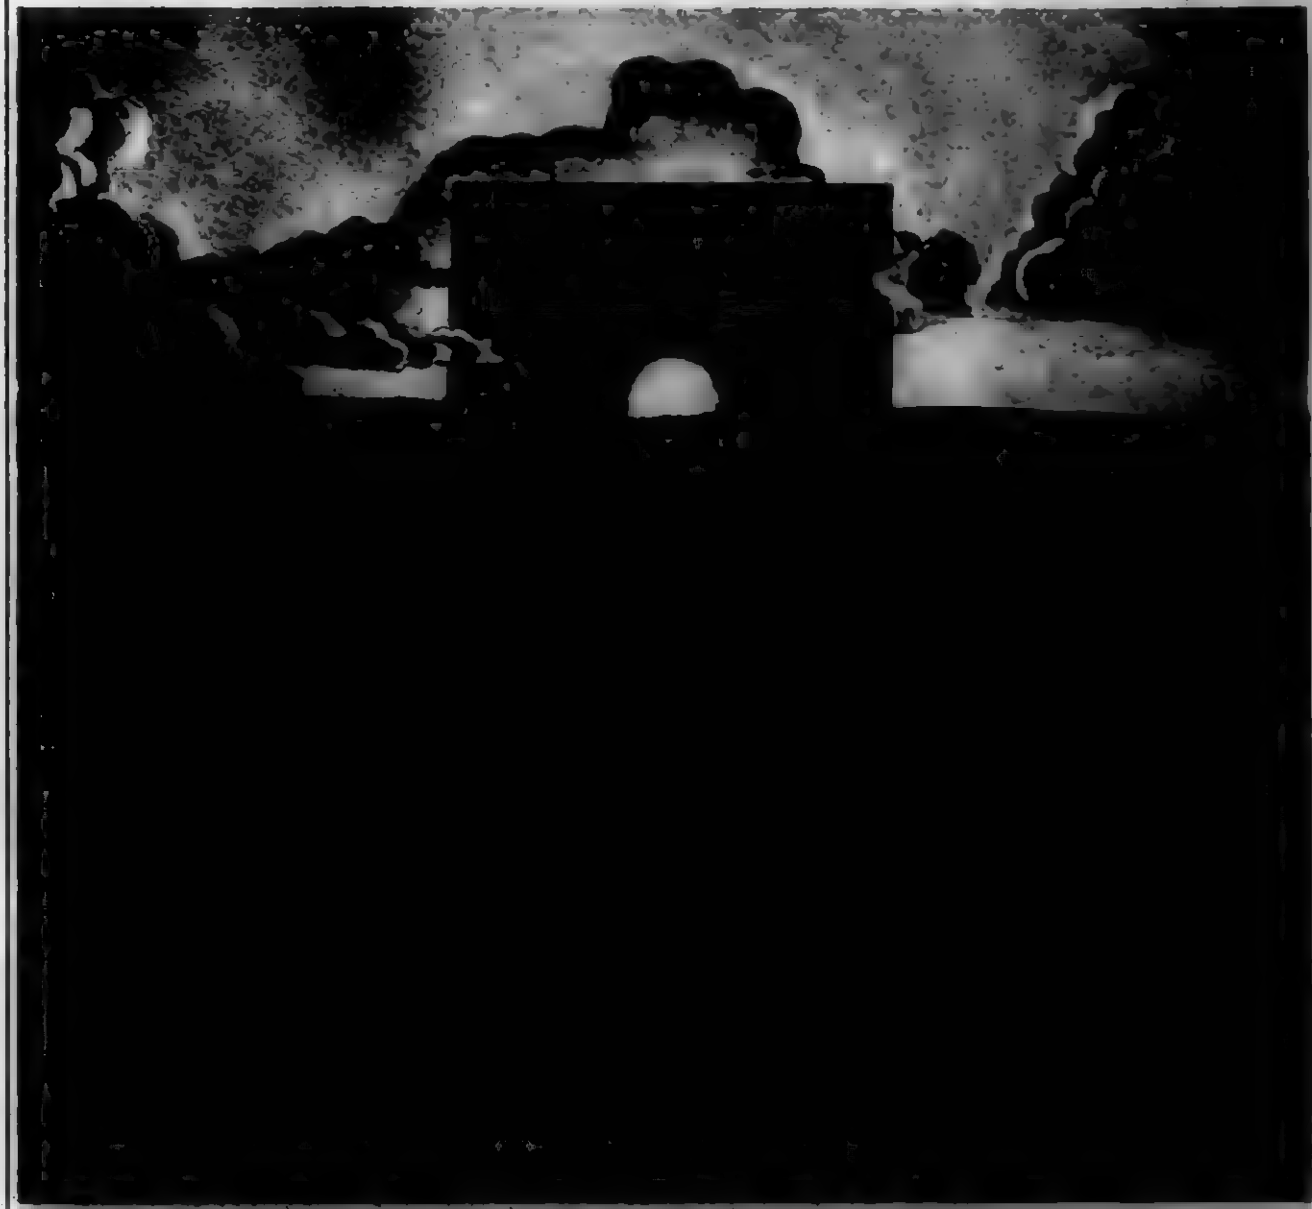
FUSION



The rush to Revelation® has just begun.

When ordinary database management software isn't enough, enlightened users are switching by leaps and bounds to Revelation, the complete database and applications environment.

That's because Revelation includes powerful tools to create applications in no time. Plus advanced features that help users get the most from their system day in and day out.

For software developers, there's a powerful applications generator that builds files, fields, menus and reports.

For corporate users, Network Revelation is already off and running on both IBM's® PC Network and any hardware running Novell NetWare.™

For hard-core programmers, Revelation's R/BASIC procedural language combines the best of BASIC with the structure and logic of C.

And for everyone, there's an advanced query language and report writer that's fluent in everyday English and eager to learn new expressions.

The secret is incomparable technology: variable-length fields to conserve precious disk space; unlimited files, fields and records; data dictionaries that make it easy to change your database when you change your mind; plus a high-speed compiler to accelerate program execution. And, of course, conversion utilities for dBase II® and Lotus 1-2-3™ are included at no extra cost.

Revelation isn't for everyone. But if you're ready for a database management system you'll never outgrow, rush to your nearby dealer.

Ask for an unforgettable demonstration of Revelation's superior capabilities.

CW Senior Editor

AT&T's reign spurs mergers

AT&T, formerly Ma Bell, probably took some lessons from Mother Nature. You can't mess with either.

At least, you can't do it alone.

The largest fly in the ointment, MCI Communications Corp., conceded this fact recently when it flew into the arms of IBM. While that agreement is significant given the importance of the companies involved, it is neither the first sign of industry maneuvering nor the latest in the turbulent long-distance telecommunications market.

It all began in late 1982 when GTE Corp., the second largest telephone company before AT&T's divestiture, moved to acquire Sprint from Southern Pacific Railroad.

It was a bold move by the local service supplier to enter the long-haul business.

Little more than a year later, United Telecommunications, Inc., the third largest telephone company before divestiture, acquired U.S. Telecom, one of the industry's largest resellers.

The MCI/IBM deal is recent history. IBM sold Satellite Business Systems to MCI in exchange for a 16% interest in the discount long-distance company.

And, most recently, Allnet Communications Services, Inc. joined forces with Lexitel Corp. Allnet is a Chicago-based carrier that operates a nationwide network, and Lexitel is a regional carrier based in Birmingham, Mich.

The impetus for the mergers and acquisitions is different in each case. As the second and third largest tele-

Financial analysis for the communications manager

FIRST IN A THREE-PART SERIES

By Daniel Minoli
Special to CW

Communications managers increasingly are being confronted with financial decisions regarding the capital equipment needed to run an efficient and up-to-date network. Even when managers restrict themselves to technical issues and delegate financial questions to experts, they still need to understand why a particular choice was recommended over another.

In a three-part series, this column will outline the basic concepts of financial analysis that are likely to apply to data communications and to capital equipment — asset — acquisition. The first two parts will define and explain commonly used terms. The third section will outline actual decision methodologies.

Two examples will guide the development: Should the manager buy a piece of gear for $2,000 or lease it for $80 a month? Should the manager buy a piece of gear for $2,000 with a maintenance fee of $100 per month or buy another model that costs $3,000 and has a maintenance fee of $50 per month?

Basic concepts

Basic terms that communications managers should be familiar with include the following:

- Capital asset. A physical asset used by a firm in producing goods or services.
- Capital budget. A statement of the firm's planned investments, generally based upon estimates of future sales, pro-

Quadram unveils micro link

ROSWELL, Ga. — Quadram Corp. has announced the Quad3278 Gateway, providing a communications link between micros in a local-area net and their IBM Systems Network Architecture (SNA) hosts.

The Quad3278 Gateway provides communications support for SNA Physical Unit Type 2 and Logical Unit Types 1, 2 and 3 sessions and services. The product emulates an IBM 3274-51C/61C communications controller and emulates IBM's 3278 Model 2 and four-color 3279 displays as well as an IBM 3287 printer.

The Quad3278 Gateway is capable of 9.6K bit/sec. synchronous host communications. The product features 512K bytes of main memory and National Semiconductor Corp.'s 32016 microprocessor set.

The product can support up to 32 concurrent users while the host continues computing. Other features include session control options such as multiple concurrent IBM SNA host sessions, user-controlled session switching, printer sharing, host-initiated printing and disk logging. A session-hold option permits the user to switch from a host session to the microcomputer operating system and back.

The Quad3278 Gateway also includes on-board parity checking of memory, an RS-232C modem connection, power-up diagnostics resident in read-only memory and downloading of Quad3278 Gateway software from any local-area network-based hard disk or diskette.

The Quad3278 Gateway costs $6,000.

Quadram, 1009 Mansell Road, Roswell, Ga. 30076.

Bridge offers video modems for CATV broadband nets

BEDFORD, Texas — Bridge Communications, Inc. has announced intelligent video modems that enable users to add video capabilities to CATV-type broadband local-area networks.

The 8433 Video Modulator and 8432 Video Demodulator handle video teleconferencing, video surveillance, closed-circuit instructional television, TV distribution and remote factory process monitoring, a spokesman said. The products are based on an Intel Corp. 8051 microprocessor.

The 8433 and 8432 can be installed in new broadband networks or in existing CATV plants used previously for only data communications.

An RS-232 port is provided for control of remote devices.

The modulator can be tuned in 250-KHz steps to any frequency between 50 and 300 MHz, and the demodulator can be tuned to any frequency between 50 and 440 MHz. Other features include a separate nine-pin connector for audio signals, selectable CATV tuning schemes, selectable automatic fine tuning and a front-panel, 4-char. LED display indicating the channel selected and other parameters.

Both units reportedly are compatible with U.S. National TV Standards Commitee video standards.

The 8433 Video Modulator is priced at $1,795, and the 8432 Video Demodulator is priced at $1,495, the company said.

Bridge, R. F. Products Division, 2001 Reliance Pkwy., Bedford, Texas 76021.

Racal-Vadic enhances modem, unveils controller

MILPITAS, Calif. — Racal-Vadic, Inc. has announced that it has added Microcom MNP error-control and speed-conversion features to its 2400PA modem. The company also announced the 855M, a stand-alone error controller that supports MNP.

Both the 2400PA and 855M are said to increase throughput by converting data from asynchronous to synchronous format. The model adapts its transmission speed to the fixed speed of data terminal equipment. The modem can operate at dial-up speeds of 300, 1,200 and 2,400 bit/sec.

A flow control feature prevents data terminal equipment from overloading the modem with data. The 2400PA offers a Modem Manager and memory editor feature, said to allow remote management and maintenance from a single location. Network managers can access and set configuration options, update and store access numbers and logon passwords and redirect call-ins when a computer goes down.

An automatic logon feature in the 2400PA allows a user to log on with a single command.

Other features include RS-232 terminal interface compatibility, operation in either synchronous or asynchronous mode, tone or pulse dialing, call-progress detection, security password to prevent unauthorized access to memory contents and user diagnostics.

The 2400PA is priced at $795. The 855M is priced at $295.

For additional information, Racal-Vadic is located at 1525 McCarthy Blvd., Milpitas, Calif. 95035.

FINANCE

from page 65

duction needs and availability of capital.

■ Depreciation. A deduction of part of the cost of an asset from the company's income in each year of the asset's life. Some typical, and minimal, depreciation intervals are five years for modems, personal computers and other pieces of small equipment; and seven years for front-end processors, private branch exchanges and other pieces of large equipment.

Recently an accelerated depreciation schedule became law that allows firms to depreciate a piece of equipment fully well before the end of its useful life. The motivation was to fend off foreign competition by permitting some segments of the manufacturing industry to retire older but still functioning equipment in favor of newer, more efficient and automated equipment.

■ Investment Tax Credit (ITC). An income tax credit is given to firms for investing in plant and equipment. It ranges between 7% and 10% of the face value of the investment. This is generally considered as a reduction of the initial equipment cost.

The proposed tax simplification legislation currently being discussed would do away with ITC. This would hurt small to medium-size firms in regard to upgrading their equipment.

■ Cash flow. This is the actual dollars coming to the firm or paid by the firm as a result of adopting an investment. In other words, it is the difference between the cash income generated by the project — new sales, products, benefits and the like — and the necessary expenditures — equipment costs, labor and the like.

■ Amortization. A sinking fund established for settling debt-financed assets; writing off expenditures by prorating them over a fixed period of time.

■ Cost of capital. The interest rate being charged to secure a loan to finance a given project, for example, the prime rate or the average rate on the securities (bonds and stocks) issued by the company. This represents the minimum acceptable rate of return on an investment or project undertaken by the company.

■ Principal. The amount of money on which interest is paid by the borrower. It decreases according to the amortization schedule.

■ Interest. Same as the cost of capital. Interest can be demanded as simple interest or compounded interest. In the former case, the borrowing charge is a linear function of the initial loan; in the latter case, the charge is an exponential function of the original loan. Compounding always makes the amount due larger than under the simple interest case. In business, compounding is the norm.

All these factors come into play in the decision of how to compare alternate strategies for capital equipment acquisitions listed above.

However, more background is required before we can find the answers to the two problems presented above. This will be done in next week's column.

MULTIPLEXERS/ MODEMS

■ **Datacom Northwest, Inc. has added a synchronous short-haul modem to their product line that complements their asynchronous model.**

Selectable data speeds range from 1,200 bit/sec. to 19.2K bit/sec. Features include analog and digital loopback, transmit and receive LED indicators and optical couplers.

The unit is available in 110V or 220V configurations and is priced at $159.

Datacom Northwest, S.W. Building 100, 3303 112th St., Everett, Wash. 98204.

■ **Aviv Corp. has unveiled the Model CC 900 8-line asynchronous communication multiplexer for Digital Equipment Corp. Q-bus processors.**

The product is based on Webster Computer Corp.'s 8-channel SDZV11 multiplexer. The companies have reached an agreement that gives Aviv manufacturing rights to the Webster multiplexer. The Model CC 900 is functionally compatible with DEC's DZ11 or DZV11 multiplexers.

The CC 900 features line programmable transmission rates, character length, parity, stop bits and transmitter enable. Two tables of 16 transmission rates each are provided, permitting access to faster rates of 19.2K bit/sec and 38.4K bit/sec.

The Model CC 900 costs $995.

Aviv, 26 Cummings Park, Woburn, Mass. 01801.

LOCAL-AREA NETWORKS

■ **Codenoll Technology Corp. has announced a switch-selectable fiber-optic Ethernet transceiver.**

The $795 Codnet-3030S can be switched to meet the interface requirements for IEEE 802.3 standards and Ethernet Version 1 and 2 equipment, the vendor said.

A user can choose from various options like ac or dc coupling and interfaces with or without self-diagnostic capabilities for standard operation or use with remote repeaters.

Codenoll Technology, 1086 N. Broadway, Yonkers, N.Y. 10701.

■ **AST Research, Inc. has introduced the AST-Netbios Option software program for its local-area networks, said to provide compatibility with software written for the IBM Personal Computer Network Adapter.**

AST's PCnet and PCnet II networking hardware emulates IBM's Network Basic I/O System (Netbios) when running the AST-Netbios Option. This enables AST to take advantage of standard IBM network applications software, a spokesman said. Netbios functions as an interface between a local network and an operating system.

The AST-Netbios Option provides support for the IBM Personal Computer Network Program. It will be available in September at a price of $195 per node.

AST Research, 2121 Alton Ave., Irvine, Calif. 92714.

AUXILIARY EQUIPMENT

■ **Emcom Corp. has added an enhanced Network Control System to its product line of management tools for complex data networks ranging in size from four to 4,096 lines at speeds to 64K bit/sec.**

NCS70/30 is said to provide real-time error and status message reports.

Response time, line utilization and activity, error and status reports are presented by a local control terminal and system printer.

The system costs $75,000.

Emcom, Suite 901, 101 E. Park Blvd., Plano, Texas 75074.

MERGER

from page 65

phone companies providing local services in the U.S., it was natural for GTE and United Telecom to venture into the long-haul market.

GTE bought a healthy company in Sprint, second only to MCI in competition with AT&T for long-distance service. United Telecom went another route, preying on what appeared to be an early casualty of divestiture. As a reseller, U.S. Telecom was eking out its living by buying bulk services from AT&T and reselling them at competitive prices.

Resellers operate on very slim margins by necessity, and the uncertainty of AT&T rates at the time of divestiture and pending access charges had all resellers — and their customers — on tenterhooks. Business was suffering, and U.S. Telecom was looking for a white knight.

MCI sought the IBM deal because it needed the deep pockets of the mainframe maker to fund its network expansion. MCI couldn't capture new customers without the new facilities and would have had problems funding the facilities without the new customer revenue.

The most recent allegiance, the Allnet/Lexitel merger, was triggered by the financial difficulty Allnet was experiencing and the fact that the companies were synergistic.

Driving all this merging, shuffling and posturing is AT&T's stranglehold on the long-distance telecommunications market. While talk of competition is rampant, AT&T still controls an estimated 90% of the industry.

And yet, by rough count, there are still over 500 long-distance carriers in the business today, according to Anne Frances Bleecker of the Competitive Telecommunications Association in Washington, D.C. Other than the companies mentioned, most all of the remaining carriers — with the notable exception of Western Union Corp. — are resellers.

Read their last rites in 1983, this tenacious group of companies has been somewhat revived by the long-distance fiber-optic carriers. These networks have created a glut of long-haul capacity and have given the resellers an option that is less expensive than leasing AT&T facilities.

The reseller shakeout, however, is inevitable, leaving perhaps a few dozen companies in its wake. Mergers, acquistions and filings under Chapter 11 of the Federal Bankruptcy Act will prevail. No industry sector, it appears, can stand alone against the AT&T tide.

SYSTEMS & PERIPHERALS

Disk cache option out

WALTHAM, Mass. — Honeywell, Inc. has announced a hardware-based disk cache processing option. The option — available to users of the company's 16-bit DPS 6/75 and 32-bit DPS 6/95 minicomputers — is said to offer improvements in system efficiency, terminal response time and terminal connectivity.

The system manages disk caching on a global basis instead of assigning a disk cache buffer to individual disk controllers, a spokesman said. Increases in actual performance with the disk cache processor depend upon the specific customer environment. To determine if and by how much the option may benefit the user, Honeywell technical field staff members use a DPS 6 system monitor.

The disk cache processor can be field installed in existing systems or ordered as an option on new systems. On the DPS 6/75, the processor price, with 2M bytes of cache buffer memory, is $18,000 if factory installed and $22,000 if field installed. Additional cache buffer memory, in increments of 2M bytes, can be added for $10,000 each, up to a maximum of 6M bytes.

On the DPS 6/95, the disk cache processor price is $12,000 at the factory and $16,000 if field installed. DPS 6/95 users must allocate at least 2M bytes of system main memory for the disk cache buffer. The system can support up to 14M bytes of disk cache buffer memory.

Honeywell is located at 200 Smith St., Waltham, Mass. 02154.

Wang offers more power for mid-range VS units

Extra configurations added for up to 80 users

By Donna Raimondi
CW Staff

LOWELL, Mass. — Wang Laboratories, Inc. has announced increases in power and configuration options for its mid-range VS computers.

Main memory capacity has been doubled to 8M bytes for the VS 85 and to 16M bytes for the VS 100 system. The VS 85 can now be ordered in 2M-, 4M- and 8M-byte versions, and cache memory is standard at each level. The VS 100 comes in 2M-, 4M-, 8M-, 12M- and 16M-byte models. Existing 4M-byte VS 85 and 8M-byte VS 100 systems can be field upgraded in 4M-byte increments to the maximum configurations. Each step of 4M bytes costs $32,000.

The company has announced an increase in the number of terminals that can be connected to the VS 65 and VS 85 systems. The VS 65 now has a maximum configuration of 40 workstations; the VS 85 can support a maximum of 80 workstations.

Enhancements in configuration include the Wangnet Peripheral Band, which allows both local direct attachment and remote attachment of workstations and other devices to the VS 15/65 and the VS 300. The modular serial I/O systems were previously available for the other systems in the VS series. The cost per connection starts at $121 for VS 15 or VS 65 installations and runs up to $182 for VS 300 systems.

A 32-port serial device I/O processor for the VS 85 and VS 100 is said to double the number of physical ports per I/O processor slot. The processor supports up to 32 VS serial ports and a total of 32 logical devices. It costs $5,000.

Also announced was the ability for VS 85 and VS 100 users to add the VS-6550 telecommunications processor. The processor is said to provide all telecommunications support circuitry and 128K bytes of memory. It supports communications in a number of networks including Wang Systems Networking, IBM's Systems Network Architecture and the X.25 protocol. The VS-6550 costs $2,200.

Newly packaged configurations include a VS 65-A package that has a VS 65 CPU with 1M byte of main memory, 16K bytes of cache memory, a 147M-byte internal disk and a small data storage cabinet offering an additional 223M bytes of storage — a 147M-byte fixed disk and a 76M-byte removable disk. The system costs $47,680.

Three VS 85 and VS 100 packages have been announced — basic hardware packages, office automation packages and data processing development packages. The hardware packages add some basic Wang Office functions to become the OA packages. The inclusion of Wang's Professional Application Creation Environment data base management software, a Cobol com-

Sequent rolls out enhancements for Balance 8000

PORTLAND, Ore. — A series of enhancements to the Sequent Computer Systems, Inc.'s Balance 8000 parallel processing system has been announced.

The Balance 8000 — announced in September — is a 32-bit parallel processing system that incorporates from two to 12 National Semiconductor Corp. microprocessors under Dynix, Sequent's version of AT&T's Unix 4.2 operating system.

An Atomic Lock Memory (ALM) enhancement, which is an add-on set of chips to the computer's multibus adapter board, is said to support 16,000 hardware locks per board, with up to four boards per system. The microsecond locking speeds of the ALM are said to support fine grain parallel programming by decreasing synchronization overhead. The ALM costs $1,000 as an upgrade for existing customers but will be standard on future machines.

A new software library is said to offer a formal, secure way to share memory among processors by adding support for dynamic allocation and reallocation of shared memory regions. A newly announced parallel programming library enables application developers to use shared memory and fast lock features through standard language library call mechanisms. It includes routines that allocate and deallocate shared memory resources and includes program synchronization primitives. There is no charge to existing customers for any of the software enhancements, the company said.

The company also announced it is replacing all of the National Semi 32016 processors in the system with the National Semi 32020 CPUs. All new machines will have the 32020s, and all existing user machines will be field upgraded at no charge.

Information can be obtained from Sequent Computer Systems, 14360 N.W. Science Park Drive, Portland, Ore. 97229.

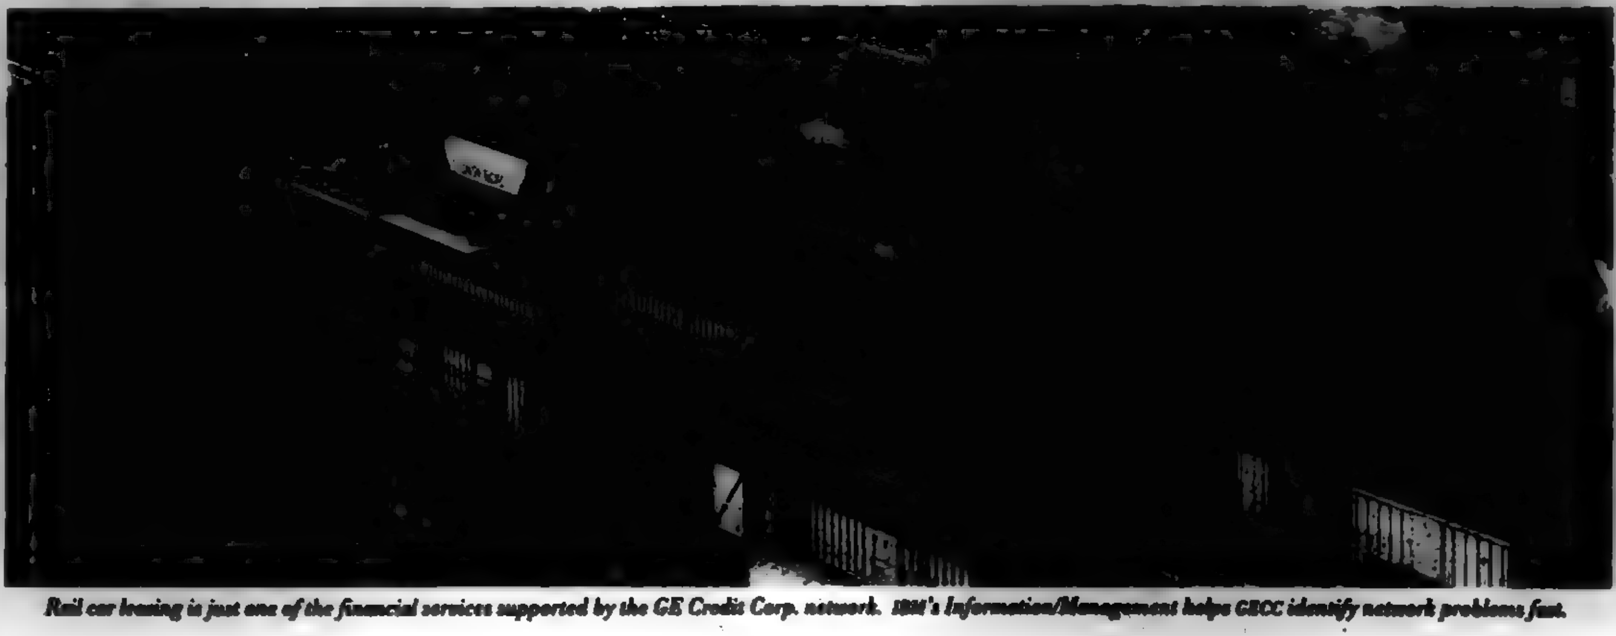
News for the DP professional



Rail car leasing is just one of the financial services supported by the GE Credit Corp. network. IBM's Information/Management helps GECC identify network problems fast.

Information/Management Helps GE Credit Keep Network On Track

"We have happier customers," says Tom Dixon, manager of computing and telecommunication services for General Electric Credit Corporation (GECC) in Stamford, Conn. He is describing the use at GECC of IBM's Information/Management, Version 2—a licensed program that helps manage large data networks.

With assets of $17 billion, GECC is one of the country's largest commercial lenders—active in retail credit, commercial leasing and mortgage banking.

And GECC operates a very large network: one with more than 2,000 terminals. The users, Mr. Dixon's customers, are in GECC field offices, retail stores and GECC client offices. They operate workstations, point-of-sale terminals and credit authorization terminals.

IBM's Information/Management program helps Mr. Dixon's staff use its computer to provide better service to customers. It enables the staff to record and retrieve all the data relevant to any network operating problems: the list of equipment at each site, the details of every communication link, a complete record of every problem occurrence at each site, complete data on every type of equipment used in the network, and a detailed file on each vendor.

These data files can be searched to learn, for example, the history of a particular incident or of all previous occurrences of similar problems.

"We know our customer's environment," Mr. Dixon says. "Over the telephone from GECC's customer support center, we can provide procedures to identify or correct the problem. We can see every change made to the telephone circuit serving that site. We can see all problems on that circuit, year to date. And we can talk to the telephone vendor in specific, geographic terms.

"We're automating ourselves so that our present staff can handle a much larger network and a much greater rate of network change," Mr. Dixon continues. "We're already handling about ten times more devices than two years ago. And we're eliminating paperwork and becoming more responsive.

"Our next step will be to automate the management of network change with Information/Management." ▪

Pacific Northwest Bell Creates Online System Fast

"This is a very large and complex system," says John Osterfeld of Pacific Northwest Bell Telephone Company. "Yet we were able to implement it with 12 programmers—half of them brand-new to programming—in a total of 13 months from preliminary design to an online production system.

"It would have taken at least twice as long without ADF."

Mr. Osterfeld, a system analyst for Pacific Northwest Bell, is referring to IBM's Application Development Facility (ADF). Designed for users of the IMS/VS data base/data communication system, ADF greatly reduces the amount of programming required to create an application.

The programmers, under the technical guidance of Mr. Osterfeld, worked with ADF to develop a new version of the Customer Account Retrieval System (CARS) used by Pacific Northwest Bell representatives to call up account histories while answering customer telephone inquiries.

"We were up against a hard deadline. The application had to replace an older version within 13 months," he continues.

"Fortunately, ADF simplified the IMS programming to the point where we could meet the deadline using some people with no programming experience at all.

"CARS now has several thousand users," Mr. Osterfeld points out, "and a very large data base. In our largest center, CARS handles 350,000 transactions a day—12 per second at peak times. So it is an application with a lot of demand on it. Execution has to be very efficient.

"And this version handles 28 I/O calls per transaction, compared to 20 or less in our previous system.

"In other words, the system as written with ADF is actually more efficient in execution than the conventionally programmed system it replaces." ▪

IBM Software Experts Answer the Call to Keep Systems Running Smoothly

It's 2:00 a.m. You're testing a new application on a tight deadline. Suddenly, something—you don't yet know what—triggers an "abend."

With software, that happens. Each new hardware configuration, new application, or different combination of software releases is a unique environment that may cause a previously hidden problem to surface.

So, to keep IBM intermediate and large system customers up and running, the skills of more than 1,500 software service professionals are always on tap. Part of the IBM National Service Division, these professionals have the full power of special data bases at their fingertips.

You just call a special 800 number. At any time, 24 hours a day, seven days a week, you reach an IBM support center in Chicago, Boulder or Tampa. These locations service IBM's MVS, MVS/XA, DOS/VSE, VM and VS/1 system products and the licensed products associated with them. The centers also service licensed products for the Series/1 and the 8100.

Often the IBM Program Support Representative (PSR) taking the call recognizes the problem and gives the customer a remedy. To help the PSR, IBM maintains a data base of symptoms and solutions for known problems. If the problem requires a revision to the code, the PSR has a Program Temporary Fix (PTF) sent to the customer by the fastest possible method—in some cases, by a telephone link.

Over 50 percent of problems are solved by the PSR. But when a problem is a new one, the customer is put in touch with a program specialist, who often is located near the actual developers of the software product.

On the most severe problems—those which have halted processing—the first goal is to find some remedy, such as a bypass, that allows work to resume. The objective is to complete this within 24 hours.

The second goal for the program specialist is a permanent solution. When this requires a new PTF, the objective is to develop and test it within 14 days. The specialist re-creates the problem, functionally tests the new PTF, and then runs "regression tests" to be sure the fix is reliable.

To close the loop, IBM periodically makes available service updates which combine all recent program changes. ▪

To consult a data base of software symptoms and solutions, IBM representatives at customer sites talk by phone to these specialists at the IBM support center in Chicago.

Cross System Product Set–Version 2 Recently Announced

With the recent announcement of Version 2, the IBM Cross System Product Set becomes a strategic productivity tool for large systems, as well as for intermediate and distributed systems. This application generator includes three licensed programs: one for creating applications, one for executing them and a third that permits end users to query the VSAM or CMS files.

The Cross System Product Set runs under all operating systems for 30XX and 4300 systems and under DPPX/SP in the 8100. With this version, support is added for IMS/VS/DB and DL/I as data bases for CICS/VS. In addition, it has been enhanced to run in systems with large networks of terminals.

Simplify MVS Installations

The IBM Custom-Built Installation Process Offering (CBIPO) is a simplified packaging of MVS. A CBIPO can cut the time to install an MVS system or subsystem from weeks to days.

Conventionally, a major system change involves a separate tape, documents and installation procedure for each program product.

With CBIPO, you first select the program products you intend to use with MVS. Then, with an automated process, IBM custom-builds an MVS system consisting of the ordered products in the form of distribution data sets.

The CBIPO also includes customized documentation that provides a step-by-step single installation path.

[illegible]...

If you're interested in the growing information needs of business professionals, you'll be interested in *IBM Software Notes for the Business Professional and Manager*, an advertisement in recent business publications that featured these products:

- IBM's Query Management Facility (QMF). QMF is part of Dow Corning's end-user computing program. QMF lets employees do ad hoc queries on relational data bases.
- The Information Facility (TIF). Pratt & Whitney manufacturing experts create computer applications quickly, easily and in plain English.
- Info Center/1 is a new functionally integrated decision support product, combining and enhancing three popular IBM products: ADRS, APL/DI, and FPS.
- The IBM Personal Decision Series (PDS) lets PC users perform a variety of tasks on corporate, departmental or personal data bases.

Computer Automation's Syfa System 2 out in U.S.

Distributed DP unit debuted in UK, Europe

DALLAS — Computer Automation, Inc. has released its Syfa System 2 family of distributed data processing systems in the U.S. The hardware and software offerings were announced in the spring in the UK and Europe.

The Syfa System 2 is a direct replacement for previous Syfa systems, which can be field upgraded to the new capabilities, the vendor said. Five multiuser, multifunction transaction processors for high-volume interactive applications are said to provide data entry and inquiry response to both local and remote data bases. Each can be field upgraded to be attached to the company's broadband local-area network bus as a resource processor.

According to Computer Automation, systems include the entry-level 150TP configuration with eight local or remote terminal ports, 128K bytes of random-access memory, 258M bytes of disk storage, 60M bytes of tape cartridge backup and one system printer.

The 170TP is similarly configured but is expandable to 256K bytes of memory and 16 terminal ports, the vendor said.

Another model, the 190TP, reportedly features a 2K-byte cache memory.

The 300TP expands to a 24-port capability, up to 680M bytes of fixed disk storage and up to two system printers.

The 1000TP — the largest Syfa System 2 configuration — is said to support 384K bytes of memory and 1.36G bytes of disk storage. In typical configurations the above models range in price from approximately $23,000 to more than $150,000, the vendor said.

Computer Automation also announced four Syfa System 2 Resource Processors (RP) that function as file servers on the company's shared resource local-area network.

An RP — operating on a Syfanet distributed network architecture — can support 128 individual sessions simultaneously.

Up to 15 RPs can be attached to a single Syfanet network, the vendor said.

The models 170RP, 190/195RP, 300/350RP and 1000/1500RP range in price from approximately $65,000 to more than $350,000.

Additional information can be obtained from Computer Automation, which is headquartered at 1800 Jay Ell Drive, Richardson, Texas 75081.

Microvax II gets EMC cards

NATICK, Mass. — EMC Corp. has announced 2M-byte and 4M-byte add-in memory cards for Digital Equipment Corp.'s Microvax II computer system.

The MVXII-2MB and MVXII-4MB are quad-height cards that reportedly use 256K-byte random-access memory devices. They are said to be compatible with the Microvax II hardware and operating system and to support all memory system features, including diagnostics and parity checking.

The MVXII-2MB costs $2,900, and the MVXII-4MB costs $5,100, the vendor said.

More information is available from EMC, 12 Mercer Road, Natick, Mass. 01760.

DATA STORAGE

■ Anritsu America, Inc. has announced a series of ¼-in. tape drives for backup and archival storage of Winchester disks in small systems that operate on the same command set as ½-in. tape drives with no modifications to existing tape handlers.

The DMT 730 series uses 8-track, ¼-in. tape cartridges and offers up to 48M bytes of storage and a mean time between failure of 10,000 hours. Data can be recorded using either serpentine or separate channel mode.

The DMT 730E model operates in a streaming mode at a data transfer rate of 86.7K bytes and tape speed of 90 in./sec. The DMT 730C operates in a start/stop mode at a data transfer rate of 28.9K bytes and tape speed of 30 in./sec. The units cost $1,400 to $1,500, depending upon options.

Anritsu America, 128 Bauer Drive, Oakland, N.J. 07436.

TERMINALS

■ Ampex Corp. has announced terminals for corporate network and multiuser systems that emulate the Digital Equipment Corp. VT220 and VT100 terminals.

The Ampex 220 is said to include an adjustable slope alphanumeric keyboard with key grouping and layout that emulates the DEC VT220. The user has a choice of data formats — either 24 lines by 80 col. or 24 lines by 132 col. The unit comes with a 14-in. nonglare screen. The Ampex 220 costs $749.

The company also released its Ampex 219 terminal that emulates the DEC VT100, VT102, VT131 and VT52 terminals and the Wyse Technology, Inc. WY-75 terminal. The terminal includes the four DEC general-purpose function keys. The unit has a 14-in. screen. The Ampex 219 costs $649.

Ampex, 401 Broadway, Redwood City, Calif. 94063.

■ Tektronix, Inc. has released a color version of its 1200 series logic analyzers.

Based on the earlier 1240 model, the 1241 logic analyzer combines a proprietary liquid crystal color shutter with a 7-in. monochrome monitor. The 1241 features a vertical expansion mode that is said to double the height of timing diagram traces.

Three primary colors — yellow, green and red — make up the color display.

The 1241 costs from $8,600 to $21,000 for 9- to 72-channel systems.

Tektronix, P.O. Box 500, Beaverton, Ore. 97077.

■ Digi-Tech Consultants has released its Satellite Terminal, said to allow up to five users to access a single-user Convergent Technologies, Inc. Ngen or Burroughs Corp. B25 workstation.

The Satellite Terminal is said to allow the Ngen workstation, which is also sold as the NCR Corp. Worksaver and as Mohawk Data Sciences Corp.'s Hero workstation, to be used as a multiuser, multitasking computer.

It will reportedly enable users at remote sites to use a workstation via a modem. Features include a 14-in. green phosphor screen and full compatibility with most existing Ngen software. No changes will be needed to any user software, the vendor said.

The unit costs $1,750.

Digi-Tech Consultants, P.O. Box 12144, Dallas, Texas 75225.

PRINTERS/PLOTTERS

■ Xerox Corp. has announced a daisywheel printer from its subsidiary, Diablo Systems, Inc., that is said to be connectable to most personal computers, word processors and workstations.

The Xerox/Diablo Advantage D80 is said to produce letter-quality documents at speeds up to 80 char./sec. with noise measured as low as 58 dbs. The unit features Diablo's all-purpose interface, which allows connection to RS-232, Centronics Data Computer Corp. or IEEE 488 interfaces.

Features include a semiautomatic paper feed, with an optional automatic dual-bin, cut-sheet paper feeder, an envelope feed and a bidirectional tractor for feeding forms and computer fanfold paper through the printer. The D80 uses Diablo's extended character set, which contains 200 char./print wheel. Multilingual print wheels are also available.

The unit costs $2,195. The bidirectional tractor costs $300, and the dual-bin, cut-sheet paper feeder costs $903 and will be available in the fourth quarter of 1985. The envelope feeder costs $300 and snaps onto the cut-sheet paper feeder.

Xerox, Xerox Sq. 006, Rochester, N.Y. 14644.

POWER SUPPLIES

■ Solidstate Controls, Inc. has unwrapped a series of uninterruptible power supply (UPS) systems for minicomputer systems.

The Powerbase 4000 series protects against blackouts, brownouts, sags, surges and frequency deviations. The UPS comes in four power-range sizes: 5, 10, 15 and 20 kVA with either single- or three-phase output for any real-time application.

Prices range from $5,000 to $30,000.

Solidstate Controls, P.O. Box 1216, Columbus, Ohio 43216.

■ Power Systems & Controls, Inc. has unveiled its Monopowerpac power distribution and conditioning system for minis and mainframes.

The Monopowerpac is said to protect against sags, surges, transients and brownouts. It uses a synchronous motor for continuous performance at -15% low voltage and -25% for up to one minute. The Monopowerpac is available in 30, 60 and 95 kVA ratings with I/O voltages of 208/208, 480/208 or 480/480.

Prices range from $30,000 to $35,000.

Power Systems & Controls, 3206 Lanvale Ave., Richmond, Va. 23230.

BOARD-LEVEL DEVICES

■ Modular Computer Systems, Inc. has announced its Classic CT/15 single-board minicomputer that supports Modular Computer's MAX IV real-time operating system and virtual memory addressing capability.

The CT/15 processor — a low-end addition to the company's Classic series — consists of a single-board CPU and contains either 512K bytes or 2M bytes of memory. An optional storage subsystem includes a 20M-byte Winchester-type formatted disk drive and a floppy disk drive for software loading. Standard Modular Computer peripherals and I/O subsystems are supported.

The 512K-byte version costs $11,500 without the storage subsystem, and $15,900 with the storage subsystem. The 2M-byte version costs $16,500 minus the storage option and $20,900 with the option.

Modular Computer Systems, P.O. Box 6099, 1650 W. McNab Road, Fort Lauderdale, Fla. 33310.

■ National Instruments has released its general-purpose interface bus (Gpib) 410 interface card and software that is said to convert an IBM Personal Computer into an IEEE 488 bus analyzer.

The product is said to be useful for Gpib troubleshooting and analysis applications, such as designing and debugging a network of test and measurement equipment controlled by a general-purpose computer.

The unit costs $495 and will be available in mid-September 1985.

National Instruments, 12109 Technology Blvd., Austin, Texas 78727.

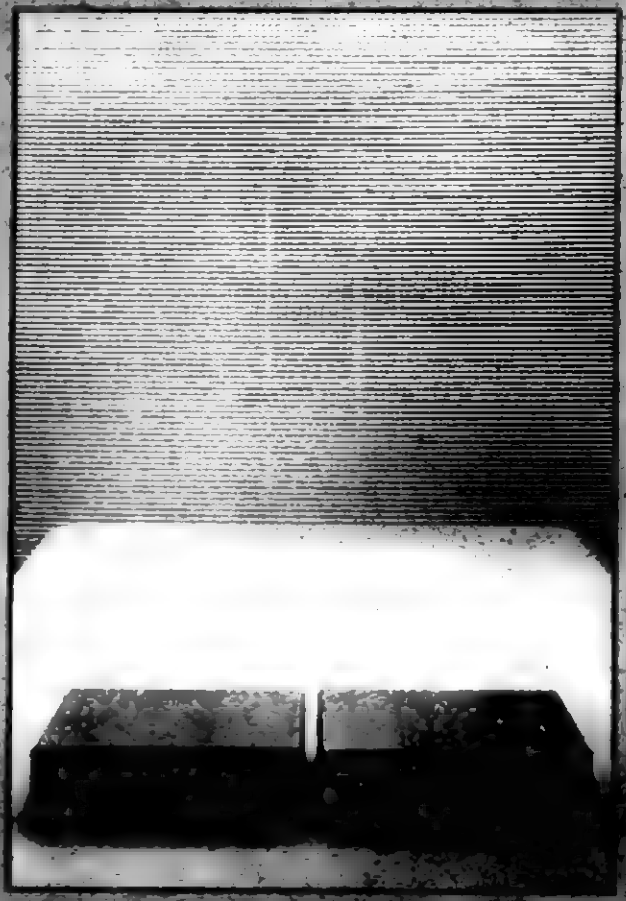
HOW TO KEEP YOUR [illegible] UP AND RUNNING.

THE DATAPHONE II SYSTEM FROM AT&T.



[illegible]

[illegible]

Today, you're more dependent on your data network than ever before. You have no time for downtime. You need reliable data communications equipment that can keep your network running strong. That's the DATAPHONE® II System from AT&T.

The DATAPHONE II System is an evolving line of high-performance data communication products—modems, multiplexers, data service units and diagnostic control devices—that combines data transmission with real-time diagnostics and sophisticated network management and control.

It's a modular system of hardworking components, designed to keep your network up and running. And to easily grow in size, speed and diagnostic capability to meet your changing needs.

Whether you have an analog or digital network, the DATAPHONE II System offers a full line of microprocessor based private line modems and data service units to provide reliable transmission and sophisticated diagnostics. These modems are the [illegible] of our system.

From this base, you can [illegible] your system in easy, planned stages. You can build an extensive network management system to match your precise needs.

To really get the most of your network, you need to make maximum use of your transmission facilities. The DATAPHONE II System offers a full line of multiplexers to meet that need, and to satisfy both point-to-point and multipoint requirements. They get your data traffic moving fast and minimize line costs. All of these multiplexers work with our analog modems and DSUs. And they connect to our System Controller to give you total network management.

Recent additions to the DATAPHONE II multiplexer line include: The 735 T-Mux, a high-speed, time-division multiplexer for T-1 facilities. The 718 Stat Mux, a statistical multiplexer with unique expansion capabilities. The 719 Networker,

Add on a little more.

Get as big as you want.

a combination of statistical multiplexing and data switching.

We're determined to keep the DATAPHONE II System at the leading edge of technology. That's why we're constantly researching and developing new products and enhancements to keep your information on the move.

Our latest digital product offering includes two new data service units, the 2500 and 2600. The feature-rich 2500 offers quick, on-site, graphic, LCD displays of test and fault reports. The 2600 provides all the features of the 2500 and the added bonus of advanced diagnostics through connectivity to the DATAPHONE II System Controller.

You can be certain a DATAPHONE II System is the right choice, offering the capability you need now with flexibility for the future.

And AT&T backs the DATAPHONE II System with the largest, most experienced sales and service force in the industry. We're available 24 hours a day to provide support and service, to troubleshoot faults and prevent problems before they occur.

To learn how our DATAPHONE II System can meet your needs from start to finish, call your AT&T Information Systems Account Executive. And ask about our flexible purchase and leasing options. Or call 1 800 247-1212 for more information.

AT&T
The right choice.

BOARDS

■ **Lexidata Corp. has announced Virtual Windows, an engineering workstation window management product supported by a board on the controller module of the company's LEX 90 graphics display processor. The product can be used with minicomputers from Digital Equipment Corp.; Data General Corp.; Honeywell, Inc.; Prime Computer, Inc.; Hewlett-Packard Co.; and others.**

Virtual Windows can display solid overlays and support color images in up to eight windows, a spokesman said. It does not require information stored on computer screen windows to be moved between display memory and the host CPU or disk memory.

Because the screen and bit map are separated, the need for a tightly coupled CPU and graphics display is said to be eliminated. Functions supported by Virtual Windows include split-window text scrolling, dynamic window size, dynamic priority setting, panning and scrolling of color graphics, solid overlays and double-buffering of bit map areas.

The product includes medium resolution of 640 by 512 pixels and high resolution of 1,280 by 1,024 pixels. Both configurations are based on the company's LEX 90/35 high-resolution graphics display system.

Virtual Windows as an option to the LEX 90 family costs $3,000. The price for Virtual Windows with the LEX 90/35 is approximately $17,000. The price for a high-resolution LEX 90/35 Virtual Windows system is approximately $23,000.

Lexidata, 755 Middlesex Tnpk., Billerica, Mass. 01865.

■ **Intel Corp. has announced a Multibus II development tool that is said to allow designers to use existing or proprietary Multibus I products in developing boards, systems and software based on the Multibus II bus architecture.**

The ISBC LNK/001 board serves as a translator between Multibus I- and Multibus II-based systems, allowing the Multibus II product being developed to gain access to the capabilities of Multibus I products as if they were resident in a Multibus II system. The board is a Multibus I form-factor board that resides in a Multibus I system and connects by ribbon cable to the Multibus II central services module.

The board costs $1,225.

Intel, Literature Department W242, 3065 Bowers Ave., Santa Clara, Calif. 95051.

ZENTEC
WE BUILD COMPATIBLES

■ **AST Research, Inc. has announced a hardware and software package that facilitates bidirectional file transfer between IBM Personal Computers and the IBM System/34, 36 and 38.**

The AST 5251-11 is a board with software that resides on the IBM Personal Computer and emulates the IBM 5251 Model 11 terminal. Included in the AST 5251-11 is VDI software, a virtual disk interface to IBM's File Support Utility that runs on System/34, 36 and 38 minis. The VDI software was developed by Tenman Systems, Inc.

The system costs $895.

AST Research, 2121 Alton Ave., Irvine, Calif. 92714.

■ **Emulex Corp. has introduced its SC03/MS controller for Digital Equipment Corp.'s Microvax, MicroPDP or LSI-11 computers.**

The SC03/MS, which uses one quad slot in the computer's backplane, reportedly permits the use of drives of various capacities without the use of driver patches. It also incorporates a storage module drive interface, giving it the ability to handle large drives.

The SC03/MS reportedly transfers data at rates up to 1.8M byte/sec. and assumes such functions as error checking and correction, bad-block replacement, command prioritizing and seek optimization.

The SC03/MS is priced at $2,000.

Emulex, P.O. Box 6725, 3545 Harbor Blvd., Costa Mesa, Calif. 92626.

■ **Network Sciences Corp. (NSC) has released local-area network interface cards that allow IBM Personal Computers and compatibles and Digital Equipment Corp.'s Rainbow microcomputer to communicate with DEC minicomputers via a Corvus Systems, Inc. Omninet local-area network.**

NSC offers two types of DXZ cards: the DQZ for Qbus machines and the DUZ for Unibus machines. The DQZ emulates DEC's DZV11 multiplexer on a dual-size card, and the DUZ emulates three DEC DZ11 multiplexers on a single hex-size card. DXZ cards are said to remove the limitations of RS-232 connections while retaining compatibility with existing DEC software.

A complete DQZ kit is priced at $2,825, and the DUZ kit is priced at $6,400.

Network Sciences, 1857 Port Charles, Newport Beach, Calif. 92660.

WANG

from page 67

piler and Wang's System Activity Monitor II make up the DP development packages.

Prices range from $115,000 to $145,000 for the VS 85 and from $137,000 to $167,000 for the VS 100 lines.

Wang's 7585VST system — the U.S. government-accredited Tempest version of the VS 85 — can now be upgraded from 4M to 8M bytes of main memory, and the number of workstations that can be added has been increased from 60 to 80.

The memory upgrade costs $44,000.

More information can be obtained from Wang, One Industrial Ave., Lowell, Mass. 01851.

The customer said...
"I need one computer system powerful enough to deliver business, scientific/engineering, and end-user processing with great performance."

And we said...

"It's here."

The DPS 90 is Honeywell's most powerful information processing system.

It was developed specifically to help even the largest organizations meet all their information processing and management needs.

THREE WAYS TO HELP

As a commercial system, the DPS 90 is capable of integrating a broad spectrum of business data processing and data management tasks—with high volume transaction and batch processing capabilities to help keep management information up-to-the-minute.

As a scientific and engineering number cruncher with an integrated array processor, the DPS 90 has all the computational power to meet the performance demands of large, sophisticated applications.

And, as an end-user system, the DPS 90 delivers all the data necessary to knowledge workers throughout a company—from the executive offices to the factory floor to the accounting department. With user-friendly software, the DPS 90 now brings mainframe computing power directly to computer novices to improve productivity in all parts of the company.

MAXIMUM UPTIME

Because Honeywell understands that maximum uptime is essential to our customers, the DPS 90 has extensive diagnostic capabilities built right into its hardware, firmware, and GCOS 8 software. In fact, it can be configured as a completely redundant system—making it one of the first mainframes ever to offer so much performance and availability.

And like all our large systems, the DPS 90 is backed by TotalCare™—Honeywell's worldwide service network that is ready to provide a full range of service and support.

Find out how the new DPS 90 can set the stage for expanding your total information management capabilities *and* help maximize your company's return on its information investment. Call 1-800-328-5111 extension 2758. Or write Honeywell Inquiry Center, MS 440, 200 Smith Street, Waltham, MA 02154.

Honeywell 100 Years

Together, we can find the answers.

Honeywell

Our issue on Big Blue can put you in the black.

Big Blue or not Big Blue.

A decision everyone must ultimately make. And even when they choose an alternative, invariably the first question is how to connect with IBM equipment.

Our December 4th *Computerworld Extra!* will provide a number of perspectives on the situation. Which will be of critical interest to anyone dealing with IBM. And that's just about everyone.

First, we'll delve deep inside the company itself. And look at possible mergers and acquisitions, corporate structure, financial status, and the personalities involved.

Then we'll take a hard look at the company's products and strategies. We'll discuss their strengths and weaknesses. We'll look at the new hardware introductions. And explore IBM's local area networking introductions.

Finally, we'll cover the alternatives, from PCs to mainframes. And of course, the compatability issue.

And all this information will go out to our 128,000 paid subscribers. Plus the hundreds of thousands of people they pass us along to.

So if you've got a product or service that's IBM compatible — or an alternative — let IBM do your selling for you. In the December 4th *Computerworld Extra!* on IBM. But hurry, closing is October 25th.

Send in the coupon below to reserve your space today. Or call Ed Marecki, Vice President/Sales, at (617)879-0700 or your local sales representative. Call today.

☐ Please reserve space for me in the *Computerworld Extra!* on IBM.
☐ Please have a sales representative call me.
☐ Send more information on your *Computerworld Extra!* on IBM.

TRW enters bid for Datapoint spin-off

By Peter Bartolik
CW Staff

Just one month after its birth, the nation's youngest publicly traded third-party computer maintenance company last week became the subject of a takeover bid by the biggest nonaffiliated maintenance company.

Intelogic Trace, Inc., the San Antonio-based service spin-off of Datapoint Corp., became the target last Tuesday of a $177 million takeover bid by TRW, Inc., the $6 billion electronics and aerospace company that operates the largest computer maintenance organization not directly affiliated with a computer vendor. Intelogic Trace said it will consider the offer at its regularly scheduled Sept. 4 board of directors meeting.

Datapoint in early July spun off its service division into an independent company with shares owned by Datapoint shareholders. Under a proposal first announced in April, Intelogic Trace is negotiating to acquire the service division of Mohawk Data Sciences Corp. A spokesman for Intelogic told *Computerworld* that negotiations are continuing with Mohawk Data.

TRW, based in Cleveland, said its offer of $9.50 per share was contingent upon negotiation and execution of a definitive agreement, revisions to Intelogic Trace's service arrangements with Datapoint and TRW's satisfaction with the controversial Mohawk Data deal. Intelogic Trace's stock closed at $7.75 on the New York Stock Exchange the day prior to TRW's announcement.

The Mohawk Data transaction has been controversial due to Datapoint's stated intention to lend the troubled manufacturer $20 million upon acquisition of the service division. Both Mohawk Data and Datapoint were the targets last year of arbitrageur Asher B. Edelman, currently chairman of Datapoint and Intelogic Trace, who acquired large holdings in both companies with the intent of selling off various divisions of each. Some analysts have seen the Datapoint-Mohawk agreement as an attempt by Edelman to bail out Mohawk after failing in his initial liquidation strategy. A TRW spokesman said the company had become familiar with the Datapoint service operations during Edelman's earlier attempts to sell those operations.

One industry analyst said the Intelogic Trace acquisition is an indication of a growing trend toward consolidation among the leading third-party maintenance companies. According to John Erlandson, manager of the customer service

Start-up firms go overseas for capital backing

By Peter Bartolik
CW Staff

Reception of U.S. investors to initial public offerings by high-tech companies is lukewarm at best these days. This means that venture capitalists have to pour additional money into existing ventures to protect their investments, so resources are somewhat strained for start-ups. But some companies are avoiding the problem by finding new investors in other countries.

"What we are witnessing is the forming of an international [capital] market; there are opportunities in certain places at certain times," according to David Nosnick, partner and international financing specialist with the Boston office of Deloitte Haskins & Sells' High-Technology Industry Group.

In a recent interview, Nosnick said the Big Eight accounting firm's high-tech group is working with three U.S. companies that are prepared to float their initial public offerings on London's unlisted securities market. The group also is working with 10 others that hope to make that move. "There are at least 25 companies in the U.S. that are in different stages of going to the London market," he said.

David Elsbree, managing partner of the group, said that any disappearance of U.S. venture capital is a myth, but the inability to float initial public offerings at favorable rates is making new demands on the venture capital groups. Because the response of public investors is not favorable, the venture capitalists are required to participate with companies for a longer period and pump in additional rounds of financing to protect their initial investments.

The solution for start-ups is to link up in corporate partnering with larger companies, such as Eastman Kodak Co., that invest in start-ups. The alternative for start-ups and those seeking initial public offerings is to go international.

Nosnick said the London market is most receptive to U.S. companies, but opportunities are opening up in Amsterdam, Van-

INDUSTRY INSIGHT
By Clinton Wilder
CW Staff Writer

And the crunch continues . . .

The battered computer industry is in for continued hard times well into 1986, according to William F. Zachmann, one of the few analysts who predicted the current slump at the beginning of this year.

The often iconoclastic Zachmann, vice-president of International Data Corp. in Framingham, Mass., said he believes that sluggishness in the overall U.S. economy will continue to affect computer purchases for the next several quarters. In a recent interview, he said that as corporate profits are squeezed and capital spending is trimmed, expensive computer acquisitions are, and will continue to be, harder for the MIS executive to justify.

"I think we are sliding into a recession, and I just don't see what is going to sustain high tech," the bow tie-clad Zachmann said. "Corporate profits are down, and the DP shops in those companies are trying to cut expenses.

See ZACHMANN page 83

Harvard expected to OK merger plan

LITTLETON, Mass. — Shareholders of Harvard Software, Inc. are expected to give final approval today to a plan to merge with Software Publishing Corp., maker of the PFS series of microcomputer software.

The acquisition will put an end to Harvard's operations here, which will be consolidated into Software Publishing's Mountain View, Calif., offices.

Eight of Harvard's 30 employees, all within its research and development and marketing and sales areas, were offered jobs at Software Publishing, according to Software Publishing President Fred Gibbons. Termination programs have been offered to the remaining 22 employees, he said.

Harvard Software President Richard Wolfson said he will work on a consulting basis with Software Publishing through the remainder of the year. Others at Harvard, including Shakeel Mozaffar, vice-president of marketing, would not comment on whether they were offered a position at Software Publishing.

The acquisition, announced in July, [CW July 8] is valued at approximately $4 million, Gibbons said. It is expected to give Software Publishing a presence in the corporate marketplace with Harvard's Project Manager software.

Software Publishing last year recorded a profit of $3.2 million on sales of $23 million. Harvard Software recorded net sales of $2.5 million for the six months ended June 30.

Judge sends NEC, Intel suit to trial

By [illegible]
CW Staff

SAN JOSE, Calif. — The long-running battle between Intel Corp. and NEC Electronics, Inc. over alleged copyright infringement will go to trial in April 1986, a U.S. District Court judge has ruled.

Judge William A. Ingram recently denied Intel's request for a summary judgment on NEC's suit filed last December. The judge said the issue was too complex and should be determined through a complete trial. An April 28 court date was set.

The NEC suit, which represented the first shot fired in the copyright battle, attempted to thwart Intel's stated plans to sue NEC, a U.S. subsidiary of NEC Corp., over alleged copyright violations of its Intel 8086 and 8088 microprocessors. NEC argued that microcode — the set of instructions embedded on a microchip — can not be copyrighted.

In April 1984, NEC announced the V20 and V30 microprocessors, dubbed supersets or enhancements to the Intel chips, and Intel threatened legal action. Intel subsequently filed a counterclaim against NEC this past February, alleging copyright infringement.

NEC general counsel Robert Hinckley said the company was pleased with Ingram's decision to bring the case to trial. There are a number of issues that need further legal exploration, according to Hinckley. "We are confident that the NEC micro-

TI, Raytheon report ventures into AI

Two electronics giants, Texas Instruments, Inc. and Raytheon Co., recently announced ventures in the burgeoning artificial intelligence field.

Another leading manufacturing concern, Lockheed Corp., announced that it invested $10 million in Rational, the Mountain View, Calif.-based developer of the R1000 system that is designed to reduce the cost and time of developing large software systems written in the Ada language.

Dallas-based TI agreed to purchase a 10% equity interest in the Carnegie Group, Inc. of Pittsburgh, a privately held developer of AI software for manufacturing applications. Under terms of the agreement, Carnegie will receive cash and equipment credits for its stock and intends to use the credits to purchase TI hardware and software. Financial details were not released.

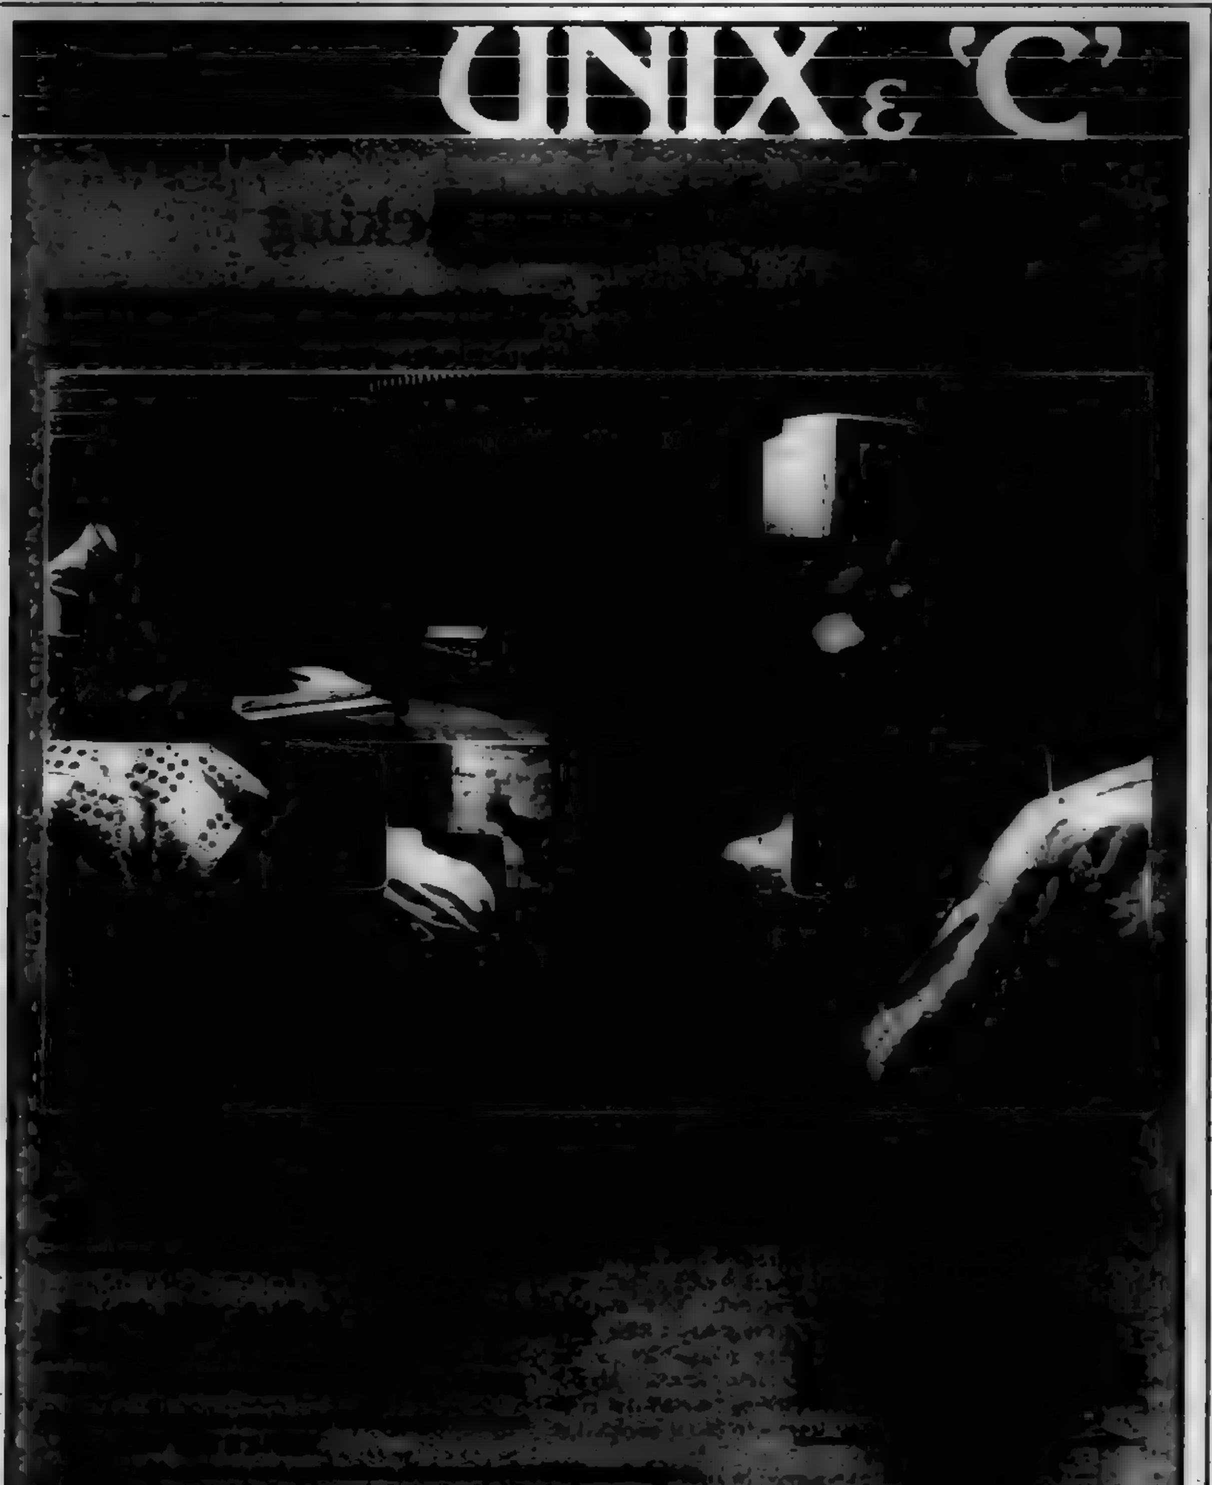
In addition, TI agreed to fund part of Carnegie's research and development for three years in exchange for technical training from Carnegie engineers and a license to distribute Carnegie technology and products internally.

Grant Dove, executive vice-president of TI, said the agreement would enhance the use of AI technology in TI's internal manufacturing operations as well as its position as a vendor of AI hardware and software products.

Raytheon announced a $4.5 million investment in Lisp Machines, Inc. of Cambridge, Mass., a developer of Lisp computers and associated software. The deal was the first struck by Raytheon Ventures, the new venture capital investment arm of the Lexington, Mass.-based defense electronics leader.

Raytheon Ventures President David A. Steadman said the company has no plans to acquire Lisp Machines.

Lockheed, the first beta test site of the R1000 hardware and software system, said its investment in Rational is "important to Lockheed's continued leadership in the aerospace industry."



Profit dip hits Cullinet

WESTWOOD, Mass. — Cullinet Software, Inc. last week reported that first-quarter profits dipped 23% from the year-earlier period as revenue increased by only 5%.

That news marked the first decline after 29 reporting periods of increasing profits. But it was not quite as severe as the 27% dip the company had projected earlier this month [CW, Aug. 12].

The company posted profits of $4.2 million, or 14 cents per share, compared with $5.5 million, or 18 cents per share, in the year-earlier period. Revenue was $42.3 million, up from $32.1 million.

Cullinet President and Chief Operating Officer Robert N. Goldman said in a statement announcing the results, "The earnings for this period represent a significant accomplishment in these economic times for our industry."

Altos earnings up 7% in '85

SAN JOSE, Calif. — Dampened by a fourth-quarter earnings drop of 39%, Altos Computer Systems, Inc.'s fiscal year ended June 29 showed only a 7% increase from fiscal 1984, the company announced recently.

Altos earned $2.24 million, or 15 cents per share, in the fourth quarter, compared with $3.71 million, or 24 cents per share, in the year-earlier quarter. Fourth-quarter revenue rose 2% to $33.7 million from $32.9 million a year ago.

Altos' profits for the fiscal year were $10.4 million, or 70 cents per share, compared with $9.75 million, or 65 cents per share, in fiscal 1984. Revenue rose 21%, from $102.7 million to $124.4 million.

Dave Jackson, Altos' president, chairman and chief executive officer, attributed the weak fourth quarter to the industrywide slowdown and Altos' shifted focus to its high-end, multiuser supermicros.

Sykes files for Chapter 11 aid

ROCHESTER, N.Y. — Sykes Datatronics, Inc., a vendor of telephone cost management systems and software here, recently filed for protection from its creditors under Chapter 11 of the Federal Bankruptcy Act.

Sykes filed the petition Aug. 15 after its two banks, Chase Lincoln First Bank and Chemical Bank, demanded payment of $7.5 million in loans, a spokeswoman said. In its most recent quarter ended May 31, Sykes posted a loss of $2.3 million on $2.7 million in revenue.

Sykes lost $14 million in the fiscal year ended Feb. 28, recording sales of $20.2 million during the year. Sykes employed about 270 people at the beginning of 1985.

COMPUTERWORLD
THE NEWSWEEKLY FOR THE COMPUTER COMMUNITY

[illegible]

Info line out

DENVER — McGraw-Hill, Inc. recently joined a corporate partnership to provide on-line data base information to home and office microcomputers through CATV systems.

The venture, called X-Press Information Services (XIS) and headquartered here, is also owned by Tele-Communications, Inc. and Telecrafter Corp. XIS will supplant Data Cable, the cable-to-computer news service launched by Tele-Communications and Telecrafter in 1984.

The partners said XIS will provide business, financial and economic information to subscribers.

A spokesman said XIS is scheduled to be available through 400 cable systems by the end of 1985.

Tandon, Teac announce out-of-court settlement

CHATSWORTH, Calif. — Tandon Corp. last week announced the out-of-court settlement of its lawsuit against Teac Corp., one of three Japanese companies orginally charged with infringing upon Tandon's patent for double-sided floppy disk drives.

Tandon had previously settled similar claims against Sony Corp. (CW, July 15).

Charges made by the American organization, based here, against Mitsubishi Electronics Corp. are still pending and being heard at an International Trade Commission (ITC) trial. The ITC trial began on Aug. 19.

Tandon to get royalties

Teac agreed that its 5¼-in. disk drives will be licensed under Tandon's patent, allowing Tandon to earn percentage royalties from the sale of the Teac drives.

In addition, Teac agreed to pay Tandon an undisclosed lump sum of money, which a Tandon spokesman called "a significant amount."

The settlement ends the actions filed by Tandon against Teac both before the ITC and in U.S. District Court in Los Angeles.

Paradyne plans leave

LARGO, Fla. — Paradyne Corp. recently announced that it will require an estimated 85% of its employees to take six unpaid vacation days during the balance of 1985.

The furlough will affect all of the data communications equipment vendor's approximately 3,300 employees except customer field service engineers and national technical support and service personnel.

George Pressly, Paradyne's senior vice-president of communications, said exempted employees will make a comparable contribution to furloughed employees but declined to elaborate.

The six furlough days include two this month, one each in September and October and two in December. Pressly said the days will generally be tacked on to holiday dates or weekends.

Paradyne laid off approximately 200 employees in June.

Delta Data posts first-quarter loss

TREVOSE, Pa. — Delta Data Systems Corp. recently reported a $1.99 million loss for the first quarter ended June 30 on a 39% decline in revenue.

The maker of terminals and turnkey systems for the legal and publishing markets lost 29 cents per share in the quarter. A year earlier, Delta earned $28,000, or 0 cents per share, including a one-time gain of $8,000. Sales dropped from $7.2 million in the year-earlier period to $4.4 million.

Delta President and Chairman Robert J. Smallacombe blamed most of the loss on a delay in placement of orders by a single large customer. He said the market for commercial data processing had softened considerably since the prior year.

The company will concentrate more of its marketing efforts in sales to government customers, which accounted for 69% of Delta's revenue in fiscal 1985, Smallacombe said.

LAWSUIT

from page 79

processor is an original design that was independently developed," Hinckley said.

When the Intel lawsuit comes to trial next April, NEC will argue against copyright protection for microcode.

Issue addressed last year

According to Hinckley, the U.S. Congress addressed the issue last year with the introduction of the Semiconductor Chip Protection Act.

The act protects chip designs but does not extend copyright protection to chips, Hinckley asserted.

Intel counsel expressed disappointment with the judge's ruling.

"Obviously we felt that [microcode] is copyrightable, but basically I can understand why [Ingram] wants the experts to testify," counsel said.

"I'll need 75 floppy copies of this new update in half an hour, Mrs. Johnson."

"75 floppy copies in half an hour?"

In the beginning there was carbon paper. Then the photocopier came along to revolutionize the way offices work. And then the microprocessor came along to revolutionize the way we think.

Today you can get a book's worth of information on a single floppy disk. But that's not all there is to it.

You have to test all your incoming diskettes to make sure they're okay. You have to format them before you can use them. And the need to make multiple copies of practically everything is greater now than it ever was. You'll want to verify that each of the floppy copies you make is good. Sometimes you'll want to protect your diskettes, and serialize them. And you'll want to be sure the job's done right.

An MST Desktop Diskette Copier does all of that automatically. At the rate of up to 300 diskettes every hour. Any size. All with higher quality than any PC can possibly deliver. It's a beautifully simple solution to what could be a burdensome problem. MST offers a whole family of systems starting at only $7300.

But, you may ask, why not just make copies one at a time on your own computers? Well, if time is not money to you, and if you're not overly concerned with perfection, you can do that. You can still use carbon paper too.

Masscomp announced revenue for the fiscal year ended June 29 of $45.2 million, down from $21.9 million a year earlier. The company experienced an operating loss of $896,000, vs. a loss of $1.2 million last year.

■

QMS, Inc. achieved record third-quarter revenue of $11.6 million for the fiscal period ended June 28, compared with revenue of $8.3 million for the third period one year ago. Profits were $1.2 million, or 13 cents per share, compared with profits of $1.4 million, or 17 cents per share, for the similar period last year.

■

NBI, Inc. announced that revenue for the year increased 22% to $216.7 million from $177.1 million recorded last year. Profits were $13.2 million, or $1.41 per share, compared with $13.8 million, or $1.40 per share, for the prior year.

■

Hogan Systems, Inc. reported a net loss of $3 million, or 23 cents per share, compared with a net loss of $1.5 million, or 11 cents per share, in the prior year. Revenue was $4.1 million, compared with $6.7 million for the like period a year ago.

■

Intelligent Systems Corp. recorded revenue for its fiscal quarter ended June 30 of $28.4 million, compared with $30.2 million last year. Profits for the quarter were $857,000, or 8 cents per share, compared with $3.8 million, or 34 cents per share, in the prior year's quarter.

■

Miniscribe Corp. reported a net loss for the second quarter of $7.1 million, or 37 cents per share, compared with profits of $2.3 million, or 12 cents per share, for the corresponding period last year.

■

Modular Computer Systems, Inc. announced profits for the second quarter of $708,000, or 12 cents per share, compared with $1.3 million, or 24 cents per share, in the like period one year earlier. Revenue was $18.4 million, compared with $20.8 million in the second quarter of 1984.

■

Mentor Graphics Corp. reported second-quarter revenue of $33.5 million, compared with $18.5 million for the same period last year. Profits were $1.8 million, or 12 cents per share, compared with $1.4 million, or 10 cents per share, in the comparable period one year ago.

■

Wicat Systems, Inc. reported revenue for its first fiscal quarter ended June 30 of $9.6 million, up 48% over $6.5 million for the same period one year ago. Profits were $110,000, or one-half cent per share, compared with a loss of $1.8 million, or 9 cents per share, in the comparable quarter one year earlier.

■

Intergraph Corp. announced revenue for the second quarter of $130.6 million, compared with $96.8 million in the corresponding period last year. Profits were $16.8 million, or 31 cents per share, compared with $16.5

ZACHMANN from page 79

I don't see the purses opening anytime soon."

In addition to the macroeconomic picture, Zachmann said he sees a fundamental change in the nature of the computer market that bodes ill for many vendors — especially IBM. Zachmann said that price/performance ratios have become increasingly better as users move down the product line, with superminicomputers replacing mainframes and with multiuser micros, with their ability to run departmental applications, replacing minicomputers.

"Price/performance has historically been better on bigger systems but not anymore," he said. "There is no more expensive way to process data than a big IBM box running MVS. IBM is losing sales of its larger machines to 4381s and to [Digital Equipment Corp.] VAXs, which are in turn losing to cheaper, smaller minis. The idea that departments will outgrow their personal computers is a myth. Most of their applications don't even come close to using the capacity of an [IBM Personal Computer AT]."

Zachmann is particularly bearish on IBM's high end, feeling that the flow of dollars from the upcoming 3090 Model 200 will be considerably less than what Big Blue is counting on. "They have a very tough time ahead," he said. "The economy is mushy, and users have a big incentive not to buy more stuff, just when IBM needs strong volume sales of the 3090 to sustain its growth."

IBM's estimated 75% mainframe market share will change from an asset to an albatross, Zachmann said, as users increasingly concentrate their purchases in the more competitively priced mini market. "IBM can't have its quasi-monopoly prices in that area," he said. "I think IBM is vulnerable from below."

Zachmann predicted that the economy will not lift the computer industry out of its doldrums before the latter part of 1986. But he noted a few bright spots in his otherwise gloomy scenario — innovative niche companies whose technologies spell real solutions for users. In his view, the local-area networks of 3Com Corp., the network servers of Banyan Systems, Inc. and the fault-tolerant systems of Stratus Computer, Inc. are prime examples.

"Products that provide truly better price/performance or better functionality will sell well," he said.

SERVICE from page 79

program with the Mountain View, Calif.-based market research firm Input, Inc., leading companies in that industry segment are seeking acquisitions in order to meet their customers' requirements for improved service.

Third-party maintenance revenue

Input last year published a study indicating that revenue of third-party maintenance companies — not including vendor-owned organizations — was $1.14 billion in 1984 and will grow to $2.12 billion in 1988.

A study by Arthur Andersen & Co. published last year for the Association of Field Service Engineers predicted that the service industry — including both third-party and vendor-owned organizations — would generate revenue of $46 billion by 1990, more than double the revenue in 1984.

Analysts from Input and other firms have determined that lower prices are no longer the prime reason equipment users turn to third-party companies, according to Erlandson. "Users are becoming more demanding of a high level of service," Erlandson said.

Large third-party companies often provide better response time through regionalized operations and have highly trained field engineers, he said.

Datapoint, according to Erlandson, "has [had] an excellent service reputation in the past" and will provide TRW with a large installed base to service, a well-trained service force as well as a large base of revenue.

In 1984, according to Input estimates, TRW's Customer Services division was the country's largest third-party maintenance provider with estimated revenue of $198 million and a 17.4% market share; one industry source said the division generated revenue last year in excess of $150 million.

Datapoint officials earlier this year said Intelogic Trace, together with the Mohawk Data service organization, would represent the largest third-party organization with revenue amounting to more than $200 million.

Last year, Management Assistance, Inc. — another Edelman target organization that was successfully liquidated — sold its Sorbus Service division to Bell Atlantic Corp., an AT&T regional holding company, for $179 million.

Can you picture a local voice/data network that is powerful, practical and priced right ...even for very small groups of users? It's real. And we've installed more than 40,000 channels.

That's right. At Teltone, we've been showing companies large and small how to manage growing voice and data networks for years, and "cost-effective" is our middle name. Right now, for example, our Data Carrier Systems are helping more than 500 companies extend the useful lives of their telephone systems by letting them double as local data networks. For as little as $450 per channel, DCS enables users to route synchronous/asynchronous data, at up to 9600 bps, to virtually any existing telephone jack. This makes adding or moving a terminal as easy as plugging in a phone—no modems, no cable, and no disruption of voice traffic at any time. We also offer a full line of high-performance multiplexers and other networking products, but most of all we provide expertise. When you do business with Teltone, you deal with our own applications experts—people who know networking inside out, and share your concern about controlling costs. If this sounds like a good idea to you, let's talk. We have offices nationwide, and we'd welcome a chance to communicate with you.

CAPITAL from page 79

couver, B.C., and other areas. The cost of making the offering in London is about 9% to 10% of the amount raised, compared with 15% in the U.S., Elsbree said.

According to Nosnick, the requirement to travel to London for annual meetings is a very attractive prospect for some entrepreneurs, but a more significant benefit is that they may also find international marketing opportunities simply by becoming "plugged into the network" abroad.

International investors at any particular time may have different concerns than U.S. investors, Nosnick said. Until Sinclair Research Ltd. and Acorn Computers Ltd. ran into difficulties in recent months, UK investors were still receptive to new hardware companies, he said. Similarly, the Amsterdam market is receptive to biotechnology firms, he added.

Elsbree said he doubted the U.S. would see another investor feeding frenzy like the one that occurred with the large number of IBM Personal Computer clone producers.

"I think the venture capitalists strayed from their own rules when they got into all these [Personal Computer] companies," he said, noting that a key rule to successful venture capitalism is to invest early and liquidate when the public market discovers the technology at issue.

NICKELS from page 83

million, or 32 cents per share, in the like quarter one year ago.

■

Sterling Software, Inc. said revenue for the third quarter totaled $6.8 million, compared with $4.6 million for the same period in 1984. Profits were $576,000, or 13 cents per share, compared with $335,000, or 8 cents per share, last year.

■

VM Software, Inc. reported an increase in second-quarter revenue to $4.2 million, compared with $2.7 million in the prior year's quarter. Profits were $590,543, or 16 cents per share, compared with $527,113, or 15 cents per share, last year.

POSITION ANNOUNCEMENTS

APPLICATIONS PROGRAMMER

Position in the Department of Electrical Engineering and Computer Science to write graphic and computational programs used in teaching two major undergraduate theory subjects. Will maintain the system of programs, write documentation and provide consulting assistance to students and faculty. This work is part of Project Athena and will be done on a VAX 11-750 system running UNIX. Requires experience with computer graphic systems (i.e. MACSYMA); experience with Berkeley UNIX; skill at numerical field computations.

AVIONICS ENGINEERS

Southern California

Northrop Advanced Systems Division is one of America's most advanced and dynamic research and development centers. Involved in such vital defense programs as the R&D of advanced bomber concept studies for the U.S. Air Force, our Southern California facility seeks the following Avionics Engineers.

Systems Engineers

Develop and analyze avionics system architecture to meet functional and performance requirements. Perform the systems engineering function for an element of the system as it progresses from concept through development, test, and integration.

Software Development Engineers

Require Scientific Programmers to design, develop, code, test and integrate avionics software for Operational Flight Programs (OFP) on a VAX 11/780 VMS operating system using such languages as FORTRAN 77, Pascal and Jovial.

Also require experienced individuals to conduct simulation on software to be developed.

Systems Analysts

Develop and perform computer-based 6 degrees-of-freedom dynamic simulations to define the integrated weapon system performance in areas such as navigation flight path control, terrain following/avoidance, and weapons delivery. Using simulations and analyses, will develop baseline and tolerance-limited performance capabilities of airborne weapons systems equipped with sophisticated digitally-controlled avionics.

VAX/VMS Systems Programmers

Experienced VAX 11/780 Systems Programmers to develop a computer system for high technology in real and non-real-time applications.

Air Data Engineers

Involves the definition, design, integration, test and calibration of an air data system. Responsible for the management of several hardware procurements, the system interface and coordination all the way through flight test. Requires experience in air data computer requirements definition and design, and in pneumatic instruments and their performance, including pitot static system. Candidates should have participated in the analysis of wind tunnel data for the determination of location of the pitot static sensors, and be familiar with Mil. Standard 1553 interface design.

Electronic Warfare Engineers

Develop integrated systems designs which encompass the full spectrum of electronic warfare. Openings in RF Threat Warning and Location Systems, IR Threat Warning Systems, Phased Array Antenna Systems, Active and Passive Countermeasures Systems, including Conventional Logic and Expert or Rule-Based Systems.

Communications and Traffic Control Engineers

Responsible for avionics system design, equipment design, proposal evaluation and vendor interface. Includes communications, identification, and navigation subsystem requirements, definition and equipment design and preparation of specifications.

On-Board Test Equipment Engineers

Participate in the definition, design integration and test of on-board test requirements for several subsystems and LRU's. Responsible for the definition of the sensors, interfaces and data recording requirements.

RF Coaxial Cable Engineers

Responsible for the definition, specification, installation and testing of all types of coaxial cables for airborne applications over a wide range of frequencies. Will manage the production program.

Navigation Engineers

Design, develop, integrate and test a highly complex navigation system, covering such areas of expertise as manufacturing coordination and Kalman filter design to software implementation. Also includes frequent contact with both the customer and subcontractors.

All these positions vary in requirements of 3 to 15 years' experience and degrees in related engineering disciplines.

RIGHT TIME • RIGHT PLACE • RIGHT MOVE

...to join Royal Insurance in CHARLOTTE, NC

The relocation of our Home Office from NYC to Charlotte, NC creates immediate openings for DP professionals – especially Applications Programmers with 2 or more years experience.

Experienced SYSTEMS/ APPLICATIONS PROGRAMMERS & ANALYSTS

Expect to enhance the scope of your professionalism and enjoy a delightful new lifestyle in one of the Sunbelt's most desirable cities by joining this worldwide insurance leader. Either now, as our data processing operations start up, or in the near-term, as our new facility becomes fully functional.

At Royal Insurance in Charlotte, NC, you'll take on challenging assignments involving one of the most sophisticated computer networks in operation anywhere. Using IBM systems at our regional and territorial offices, tied into our IBM 3084 mainframe, enables us to bridge the input and retrieval function. Enhanced by using terminals and TSO at the host site, you'll be working with the newest, most exciting high technology systems.

To qualify for these exceptional opportunities in a multi-project environment, you must be experienced in one or more of the following: COBOL, Assembler, MVS-XA, JES2, ACF-2, TSO, IMS DB/DC, SMP, CICS or VTAM. Insurance background is NOT required.

Salaries are excellent, benefits full ranging and our comprehensive relocation package will provide many extras for you and your family.

For prompt, confidential consideration, we invite you to forward a resume with salary history and requirement, or call toll-free to: Colleen Ford at 1-800-[illegible].

Data Processing

Help Us Maximize Our DP Support For R&D Planning.

The Agricultural Division of CIBA-GEIGY, one of the world's foremost specialty chemicals companies, is using the newest and most advanced technology available to support our R&D efforts. This has resulted in the creation of two excellent opportunities for experienced individuals who can make a substantial contribution within our R&D Information Systems area.

R&D Information Systems Analyst

You will function as liaison between end users and the tools and data available through this system. You will also develop and install data retrieval/analysis systems, and provide formal training classes and consulting. We require a BS degree in Computer Science or a related field and at least 5 years' computer experience (2 years in a VAX/Oracle environment is desired). Excellent communication/interpersonal skills and the ability to develop and conduct training classes are required.

R&D Computer Systems Manager

You will be responsible for the successful operation and implementation of the VAX 785 software and hardware. Additionally, you will develop special software systems to facilitate end user usage and serve as a consultant to both end users and R&D computer professionals. Your qualifications must include a BS degree in Computer Science or a related field and at least 5 to 7 years' computer experience with 2 years in a digital VAX environment. A working knowledge of ORACLE database is desirable. Excellent communications/interpersonal skills and demonstrated training skills are also required.

In return for your expertise, we offer an excellent salary and benefits package and the opportunity to work in a highly progressive and professional environment. For immediate consideration, forward a resume, including salary history and requirements, in confidence to: Mr. Jeff Owens, Supervisor Employment & EEO, CIBA-GEIGY Corporation, Dept. CW721 P.O. Box 18300, Greensboro, NC 27419. We are an equal opportunity employer m/f/h/v.

Our newest program for growth...
Hardware!

The rapid growth of Dynamic Control is about to enter a new dimension. The success of our total software solutions for the healthcare industry has brought major career potential to our employees. There has never been a better time to join us.

Facilities Planner

This groundbreaking opportunity involves plenty of travel and broad systems exposure, and requires a "big picture" mentality grounded in solid knowledge of hardware architecture. As Facilities Planner, you will visit customer sites, identify equipment requirements and assist in producing proposals, based on your proven abilities in configuring and presenting IBM System 38 and 36 via direct client contact. If you have 3-5 years experience suiting you for this marketing support role in IBM hardware sales and installation, along with cross-industry hardware knowledge, flexibility, a love of travel, and a will to win, this opportunity may be for you. Direct experience in hardware physical planning is a distinct plus.

Programmers/Programmer Analysts

Work on our state-of-the-art IBM System 38 hardware, and make the most of your programming experience in RPG II on S/34, S/36 or RPG III in an interactive on-line environment. Your 2-3 years experience may connect you with an opportunity in Systems Development, Customer Support, Client Services, or Clinical Systems. Opportunities exist in Orlando, Florida, Bethesda, Maryland, and Los Angeles, California.

Dynamic Control is a division of Travenol Laboratories, a Fortune 500 health industry leader. We are also a major force in the growing technical sophistication of major medical facilities around the world. The salary and benefits we offer are competitive, and your potential for growth with us is excellent. For immediate consideration, call Carol Wineland TOLL FREE at 1-800-[illegible] or send your resume to: Human Resources Dept. [illegible], [illegible] Springs Dr., Longwood, FL [illegible].

MIS OPPORTUNITIES

As a world class leader in the $2 billion snack food industry, Frito-Lay maintains a state-of-the-art Management Information Systems Department. Our continued growth and operational efficiency depends not only on the most technically advanced equipment and systems, but on top quality people with a demonstrated ability to accept increasing responsibility.

With our new facility scheduled for completion later this year, we must identify experienced professionals for our existing Dallas headquarters, as well as for our new facility in Dallas.

Manager-Production Support

Reporting to the Manager of Production Services, this position will be responsible for application change quality and administration, batch production staging and problem resolution. Individual must possess a degree and at least 4 years of production management experience. A good understanding of batch systems processing and 5-8 years experience, including applications development are required. The exposure to various levels of management dictate strong verbal and written communications. A demonstrated ability to develop and motivate staff members is expected.

Shift Manager Computer Operations

In controlling the batch production processing for the Sales, Marketing, Manufacturing, and Accounting functions, the incumbent must interface with various levels of development and user management to set system priorities and develop contingency plans as needed. Other duties include monitoring the total processing complex, minimizing the impact of hardware and software malfunctions, and directing the training of subordinates. Reporting to the Data Center Manager, the Shift Manager must possess a degree, 1-3 years in operations management and 4-6 years of data processing experience. The exposure to various levels of management dictate strong verbal and written communications skills, as well as a demonstrated ability to develop and motivate staff members. This opportunity offers a 3 day week rotating work schedule.

Exceptional individual achievement is expected in Management Information Systems and is the ultimate criteria for significant reward and recognition in these challenging positions. If advancing your data processing career means upgrading to exceptional opportunities for career development, superior facilities, and outstanding salary and benefits — now is the time to look to Frito-Lay! Please forward resume, including salary history to:

Frito-Lay, Inc.

UNITED AIRLINES

The continued, accelerated growth of our sophisticated computer operations has created key openings for individuals skilled in MIS training and instruction. United maintains a genuine leading edge environment; incorporating hardware and software technologies as they impact the marketplace. The individuals we seek will anticipate and incorporate state-of-the-art technologies into our ongoing Training and Development process.

MANAGER — TECHNICAL TRAINING & DEVELOPMENT

Position has full responsibility for division-wide needs analysis and program planning. The qualified candidate will manage the design and implementation of technical training programs devoted to keeping United staff at the leading edge in MIS hardware and software. MS in Education or Instructional Design and at least 2 years of related management level experience essential.

TECHNICAL COURSE DESIGNERS/TRAINERS

Qualified individuals will be responsible for the development and delivery of technical training programs utilizing a wide range of media. Involves development of student and teaching outlines, course materials, testing and evaluation tools, etc. At least 2 years of experience in the design of computer operations and communications network training programs required. MS in Education or Instructional Design preferred. Computer-based training and video production experience a definite plus.

These positions are located at our corporate headquarters complex in suburban Chicago and at our Denver Computer Center. We provide an outstanding compensation package including relocation assistance. Pass/reduced fare air travel privileges provided. Send your resume with salary history, in confidence, to: Professional Employment/EXOPX-KY, United Airlines, P.O. Box 66100, Chicago, IL 60666. *Equal Opportunity Employer.*

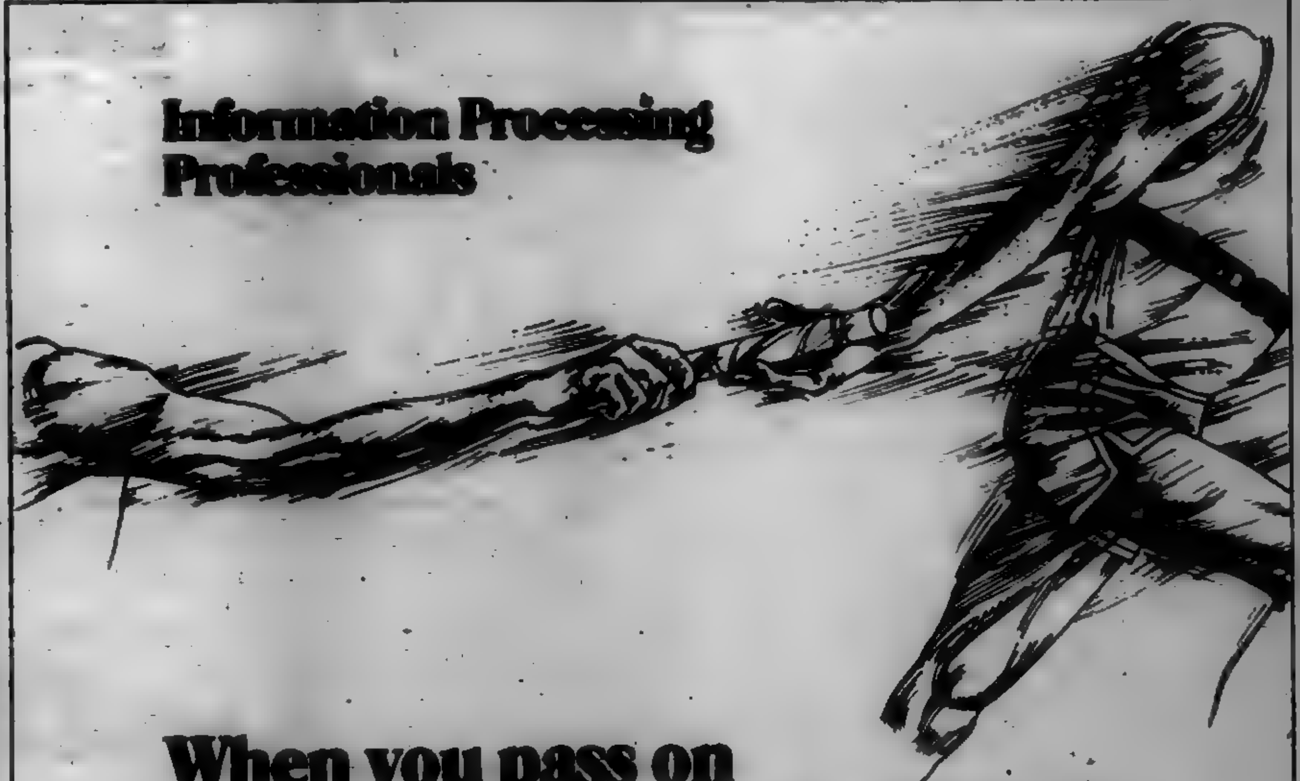
Information Processing Professionals



When you pass on what you know, everyone wins.

It's time to make your career move to the front with a fast-moving company. Electronic Data Systems (EDS) Corporation has grown to be the dominant company in the information processing field. We employ more than 35,000 people, generated over $947 million in annual revenues in 1984, and have an amazing growth rate of 25% per year. Daily transactions exceed six million from more than 50,000 on-line terminals, and we have created the nation's third largest communications network. In this environment of rapid growth, your opportunities for career advancement are virtually unlimited.

EDS is now looking for outstanding professionals to train recent college graduates through our dynamic Systems Engineering Development (SED) Program.

SED — a vital investment in our future.

The SED Program, nationally recognized as the model for the industry, is designed to turn out the best Systems Engineers. At EDS, a Systems Engineer is a computer programmer, programmer analyst, and systems analyst all in one — capable of solving complex business problems through computer applications. Obviously, this dynamic program requires instructors above the norm — in both ability and motivation.

Your career with EDS

These positions are highly visible and offer an excellent introduction into management. Our instructors are afforded the opportunity to supervise 20 employees, make performance evaluations, and provide career counseling. At the end of a typical 18-month to two-year assignment, instructors are given the opportunity to remain in the educational department, or to choose another career path within EDS according to their interests and capabilities.

Can you qualify?

The professionals we seek must have 3-5 years work experience and have a keen interest in both the technical and business aspects of information processing. Candidates must also have excellent comprehension of COBOL or ALC and recent IBM mainframe experience. Background in CICS, VSAM or in a data base environment is a plus. Although no previous teaching experience is required, you must have a professional image and be able to present your thoughts clearly in an organized manner. U.S. citizenship is required.

If you qualify, we would like to talk with you. Please send us your resume or call now. Your career time is too valuable to waste.

Call us collect Monday-Friday from 9:00am-5:00pm (Central Time) at (214) 490-2904. Or send your resume to:

Why should a Systems Programmer join Central and South West?

Because CSW provides an environment where your success is guaranteed, if...

- You enjoy working toward not-so-common objectives in a *team* environment but also enjoy planning and doing your own work
- You seek the opportunity to apply your knowledge
- You are motivated by your own professional 'pressure' to do a job well.

Currently, opportunities are available for persons to apply **CICS** experience and for persons to apply **MVS/XA** knowledge and/or experience as we move toward XA.

- **Senior Systems Software Analyst—MVS** Will plan and implement MVS/XA conversion. Will also provide technical support for MVS/SP including installation, maintenance and problem determination. Could support VM and VSE.
- **System Software Analyst—MVS** Will assist in installation, maintenance and problem determination of MVS/SP. Will assist in conversion activity for MVS/XA.
- **Senior System Software Analyst—CICS** Will provide primary support for planning and implementing CICS and evaluating system performance. Will direct and monitor the work of others.

Our environment includes Amdahl 470 V8's and 580 with MVS, VM, VSE, JES2, TSO/ISPF, ACF2, MSI, CICS, SMP, DPF and ROSCOE.

For immediate consideration, please send your resume and salary requirements to the Employee Relations Department. Principals only.

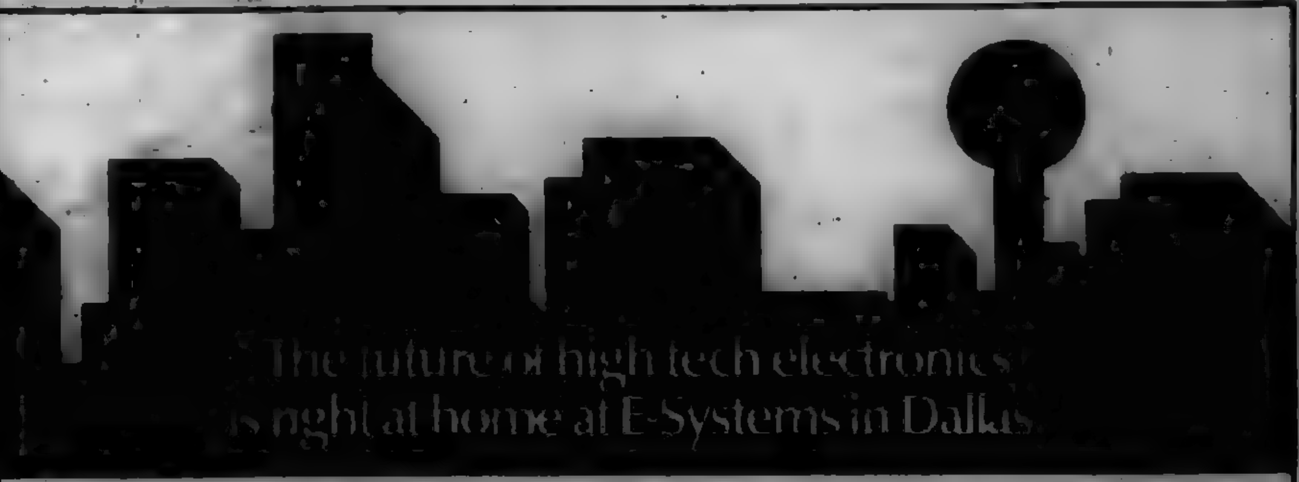
SUPERVISORY SOFTWARE ENGINEER

[illegible]

Employer Paid Ad



The future of high tech electronics
is right at home at E-Systems in Dallas.

At the Garland Division of E-Systems, our primary objective is concern for you, our employee. We demonstrate this concern in areas that include superior technological programs, innovative work environments, and an excellent compensation package. E-Systems Garland Division is seeking engineering leadership in the following areas:

Contact Ann Olsen for specific information about these Senior positions:

PROJECT LEADERS

Responsible for assisting software development managers with definition and implementation of tasks in software project planning, procedures, Unit Development Folders, proposal writing and cost estimation of government-type programs. BSCS, EE or Math with six plus years experience. Experience with VAX, PASCAL and MIL-SPEC standards required. These individuals will eventually assume roles in software management.

SENIOR SOFTWARE ENGINEERS

Responsible for implementing the tasks defined below on software development projects. These engineers will report to project leaders. BSCS, EE or Math with six plus years experience in definition, design, development and delivery of software systems, utilizing VAX or Motorola 68000 computers. Required fluency in PASCAL, structured FORTRAN, MACRO-11 or Assembly languages. Experience with MIL-SPEC standards required.

SENIOR VMS SPECIALISTS

Responsible for definition, development and enhancement of software development environment on VAX systems, BSEE (MS) or CS with seven plus years related experience with VAX systems in PASCAL fluency required. Must be VMS internalist within I/O driver systems. Defense environment background a plus.

Reba McCarvell will give you more information regarding the following:

SOFTWARE ENGINEER

Responsible for design, coding, and testing of systems level software. Position requires minimum of BSCS or BSEE degree with at least two or more years experience with the VAX 11/750 or 780 and VMS operating systems. Experience in one or more of the following areas is desirable: MIL-Standard documentation, UYK series computers and real time signal processing architecture.

BUSINESS PROGRAMMER ANALYST

Responsible for development and maintenance of on-line systems in an IBM OS/MVS IDMS CICS environment. Must have a college degree in Business, MIS or related field, and three to five years experience developing/maintaining on-line systems, supporting Accounting, Manufacturing or Purchasing/Inventory control.

DATA BASE ADMINISTRATOR

Responsible for the installation of IDMS in an IBM OS/MVS environment, for the design and maintenance of the data base and related data dictionary, and for the development and enforcement of standards and procedures for its usage. Requires a college degree and three to five years data base Design/Administration experience.

The Garland Division of E-Systems is impacting the future of electronics with exciting new projects that offer challenge and recognition. You can participate in an advanced human resources program which includes a flexible employee benefits package (FLEXCOMP), and a company-paid Employee Stock Ownership Plan. With Dallas recognized as being one of the most enjoyable and livable areas in the United States, the Garland Division of E-Systems can offer the senior engineering professional what is needed.

If joining E-Systems in Dallas means a move, E-Systems will offer you a personalized relocation program. We realize the difficulties of acclimating an individual or a family group to a different living situation. Our staff makes it a point to assist you and your family members after you have made the decision to join a company embarking on the most advanced programs in existence. Our dual assistance program is designed to ensure your move to E-Systems in Dallas will be a step forward in every area of your professional and personal life. For immediate consideration please write in confidence, to: **Staffing Manager, E-Systems, Inc., Garland Division, P.O. Box 660023, Dept. 41, Dallas, Texas 75266-0023.**

Send resume to: 7310 Woodward Ave., Room 415 Detroit, MI 48202. Refer to No. [illegible]. Employer paid ad.

Get your money's worth.

Computerworld will lower your cost-per-hire.

When you're looking to fill MIS/DP positions, there's really only one place you need to advertise. Computerworld.

In every major market, Computerworld reaches more data-processing professionals than the local recruitment media. And we reach them for less.

Over 580,000 computer-involved professionals receive Computerworld every week. That's more than any other computer trade journal, business publication, or general-interest magazine.

Computerworld delivers quality readership, too. Fully 41% of our subscribers read Computerworld's recruitment section every week. And 85% of our subscribers read this section regularly.

That's why over 4,000 organizations ran more than 8,000 recruitment ads in Computerworld in 1984. The openings they advertised for cover the whole gamut of MIS/DP positions – including systems analysts, computer science & software engineers, directors of MIS/DP, programmers, sales managers, and systems managers.

As a matter of fact, recruitment advertising has made Computerworld the national leader in classified advertising among specialized business publications (according to Business Marketing magazine).

Compare costs and the people reached. You'll find that Computerworld is the number one medium for computer-related recruitment advertising.

Find out how we can lower your cost-per-hire. Get your copy of our "1985 Quick Reference Rate Card." Call toll-free (800) 343-6474. In Massachusetts call (617) 879-0700. Call now. We'll help you find the people you need.

DATA PROCESSING PROFESSIONALS

As THE PROGRESSIVE CORPORATION'S sales soared from $[illegible] million to $[illegible] million in just the last 5 years, our MIS installation itself grew at an equally remarkable rate. Today, Progressive's MIS environment is five times larger than it was only a few years ago. With MIS being central to our company's ongoing leadership in the financial security industry, our DP professionals enjoy outstanding potential for career satisfaction.

We're seeking people who can apply an exceptional level of skills in a multiple IBM mainframe installation featuring 3033-3081. Our operating environment consists of MVS/JES2-CICS and supports a nationwide SNA/VTAM network. We have an exciting agenda of current and upcoming projects that assure you "the Progressive challenge" in the following opportunities:

PROGRAMMER ANALYSTS

Programmer Analyst and Senior Programmer Analyst opportunities exist for those who seek challenges in a variety of Financial applications. You will also experience user interaction to a great extent. Candidates must possess a minimum of 3 years' experience in a large IBM mainframe environment with OS/MVS and COBOL. A 4-year degree in Computer Science is preferred.

OPERATIONS SHIFT MANAGERS

We're seeking people to assume complete management responsibility for the shift operations and production control area, including supervision and development of a talented professional staff. Qualified candidates will have a 4-year degree and at least 5 years' successful DP experience that includes one year shift operations management responsibility as well as one year of IBM OS/MVS and JCL experience with expertise in production control.

MANAGER, APPLICATIONS PROGRAMMING

Your creativity and strong technical expertise will come into play as you lead applications development projects of major importance to the company. The candidate we seek will have at least 8-10 years' DP experience and a minimum 3-4 years' managerial experience. Your background must include key participation in the development of new systems and applications. A 4-year degree is required, and an advanced degree would be an added plus. Our ideal candidate will have a demonstrated record of successfully leading major projects under aggressive deadlines.

MVS SYSTEMS PROGRAMMERS

These important positions will support application programmers, operations and MIS management through problem solving, design and consultation. Candidates must possess a 4-year degree in Computer Science coupled with 3-5 years' experience installing and maintaining MVS and related software products.

OPERATIONS MANAGER

We are looking for an individual capable of planning and directing the activities of the corporate data center. Scope includes: machine operations, production control, customer service and scheduling. The successful candidate will possess a 4-year degree in Computer Science, augmented by extensive experience in operations.

At Progressive you will discover an opportunity for unlimited career development, and you will enjoy working in an appealing campus-like corporate setting. Your performance will be rewarded with a salary and fringe benefits program that is tailored toward attracting and retaining exceptional professionals. For a career of recognition and solid advancement potential, forward your resume, with salary history, in confidence to: Human Resources Dept., Box [illegible], THE PROGRESSIVE CORPORATION, 6300 Wilson Mills Road, Mayfield Village, OH 44143. An Equal Opportunity Employer M/F/H.

EQUAL OPPORTUNITY EMPLOYER

SOFTWARE ENGINEERS

LOOK TO LEAR SIEGLER!

The Support Software Group of Lear Siegler Instrument Division is looking for a few outstanding individuals to contribute to their advanced work in programming systems and environments.

Openings exist for candidates at several levels, including recent graduates. Applicants should have a BS or MS in Computer Engineering. The ideal candidate will have a background in developing large, well structured and well documented systems programs. The ability to produce quality code with minimal supervision is required. Experience with ADA, PASCAL, JOVIAL or FORTRAN would be helpful.

The team is involved in developing and supporting ADA environments and tools and cross-targeted programming systems including compilers, assemblers, linkers, simulators and test stations; analyzing architecture/language tradeoffs; and researching and overseeing application of leading-edge software development technology.

Look to Lear Siegler, where personal growth is strongly encouraged and your professional contributions are rewarded with an excellent compensation and benefits package, as well as advancement opportunities. The Western Michigan area is famed for its outdoor activities and Grand Rapids' housing costs are low and the school systems are excellent. To be considered, forward your resume and salary requirements to:

Send resume to:

Director of MIS
[illegible] Company
P.O. Box [illegible]
[illegible], CA [illegible]

Don't trust us to keep your classified information secret

Every week, we deliver more of your target audience than anyone else. Our [illegible] computer-involved professionals, including MIS/DP directors, systems analysts, programmers, and engineers – as well as corporate presidents, treasurers, and general managers.

And we deliver these readers for less. Compare costs and the people reached. You'll see that Computerworld is the number one medium for reaching MIS/DP professionals.

Our readers rely on Computerworld's classified section. In fact, 41% of our subscribers read the recruitment section every week. And [illegible]% of our subscribers read this section regularly.

Readership like this means response. Just ask some of the 4,000 organizations that ran more than 6,000 recruitment ads in Computerworld in 1984.

We make your ads work harder. Because we divide the classified section into logical categories: Position Announcements; Buy, Sell, Swap; Software For Sale; Time & Services; and The Bulletin Board. (Available on request: Software Wanted; Business Opportunities; and Real Estate.)

So the people you want to reach will spend less time looking for your ad, and more time reading it.

We'll even typeset your ad at no extra charge. All you need to do is attach clean typewritten copy to your order. (Figure about 25 words per column inch, not including headlines.) Or give us your order over the phone. We'll do the rest.

And since we're published weekly, we can offer you a fast turn-around from when you place your order to when your ad appears. As little as 10 days.

The next time you want results, advertise in Computerworld classified pages. Call toll-free at (800) 343-6474. In Massachusetts, call (617) 879-0700. Call now.

Your business problems need not be terminal

COMPUTERWORLD, the nation's #1 computer trade newspaper has the #1 cure for your business needs — its Classified pages.

All the remedies are there:
- finding computer professionals for you
- finding you a job
- buying/selling/leasing your computer equipment
- securing bids and proposals
- announcing seminars & conferences
- advertising available real estate
- advertising your computer time & services

At [illegible] per line ([illegible] per column inch), you can put an end to your troubles. [illegible]

All materials should be sent to:

COMPUTERWORLD
Classified Advertising
375 Cochituate Road, Box 880
Framingham, MA 01701

Get on the road to recovery! Call us at [illegible] to give your ad over the phone, reserve space, or request a rate card.

SAS Institute Inc. Announces

Lattice C Compilers for Your IBM Mainframe

Two years ago...

SAS Institute launched an effort to develop a subset of the SAS® Software System for the IBM Personal Computer. After careful study, we agreed that C was the programming language of choice. And that the Lattice® C compiler offered the quality, speed, and efficiency we needed.

One year ago...

Development had progressed so well that we expanded our efforts to include the entire SAS System on a PC, written in C. And to insure that the language, syntax, and commands would be identical across all operating systems, we decided that all future versions of the SAS System—regardless of hardware—would be derived from the same source code written in C. That meant that we needed a C compiler for IBM 370 mainframes. And it had to be good, since all our software products would depend on it.

So we approached Lattice, Inc. and asked if we could implement a version of the Lattice C compiler for IBM mainframes. With Lattice, Inc.'s agreement, development began and progressed rapidly.

Today...

Our efforts are complete—we have a first-rate IBM 370 C compiler. And we are pleased to offer this development tool to you. Now you can write in a single language that is source code compatible with your IBM mainframe and your IBM PC. We have faithfully implemented not only the language, but also the supporting library and environment.

Features of the Lattice C compiler for the 370 include:

- **Generation of reentrant object code.** Reentrancy allows many users to share the same code. Reentrancy is not an easy feature to achieve on the 370, especially if you use non-constant external variables, but we did it.
- **Optimization of the generated code.** We know the 370 instruction set and the various 370 operating environments. We have over 100 staff years of assembler language systems experience on our development team.
- **Generated code executable in both 24-bit and 31-bit addressing modes.** You can run compiled programs above the 16 megabyte line in MVS/XA.
- **Generated code identical for OS and CMS operating systems.** You can move modules between MVS and CMS without even recompiling.
- **Complete libraries.** We have implemented all the library routines described by Kernighan and Ritchie (the informal C standard), and all the library routines supported by Lattice (except operating system dependent routines), plus extensions for dealing with 370 operating environments directly. Especially significant is our byte-addressable Unix®-style I/O access method.
- **Built-in functions.** Many of the traditional string handling functions are available as built-in functions, generating in-line machine code rather than function calls. Your call to move a string can result in just one MVC instruction rather than a function call and a loop.

In addition to mainframe software development, you can also use our new cross-compiler to develop PC software on your IBM mainframe. With our cross-compiler, you can compile Lattice C programs on your mainframe and generate object code ready to download to your PC.

With the cross-compiler, we also offer PLINK86™ and PLIB86™ by Phoenix Software Associates Ltd. The Phoenix link-editor and library management facility can bind several compiled programs on the mainframe and download immediately executable modules to your PC.

Tomorrow...

We believe that the C language offers the SAS System the path to true portability and maintainability. And we believe that other companies will make similar strategic decisions about C. Already, C is taught in most college computer science curriculums, and is replacing older languages in many. And almost every computer introduced to the market now has a C compiler.

C, the language of choice...

C supports structured programming with superior control features for conditionals, iteration, and case selection. C is good for data structures, with its elegant implementation of structures and pointers. C is conducive to portable coding. It is simple to adjust for the size differences of data elements on different machines.

Continuous support...

At SAS Institute, we support all our products. You license them annually; we support them continuously. You get updates at no additional charge. We have a continuing commitment to make our compiler better and better. We have the ultimate incentive—all our software products depend on it.

For more information...

Complete and mail the coupon today. Because we've got the development tool for your tomorrow.

The local area network for companies with bigger things in mind.

How far do your communications needs take you?

The next building? The next city? The next continent?

With Codex, the answer is anywhere you want.

The Codex LAN offers you unmatched flexibility and efficiency.

It lets PC's not only share information, but expensive resources such as printers and disks.

It allows you to include minicomputers and mainframes from many vendors in your network, so everyone can share resources.

You can even tie one local area network in Boise to another local area network in Bangkok. Or Boston. Or both.

The Codex LAN is a complete systems solution. With software that allows sharing of peripherals. Capabilities for both baseband and broadband communications. Plus all the internetworking gateways you need to tie your LAN to other networks in your organization—whether it's our network or someone else's.

Then there's the advantage of Codex experience. For the past twenty-three years we've literally written the book on networking, statistical multiplexing, adaptive routing, protocol intervention, you name it.

If you're beginning to get the feeling that there's no end to what a Codex network can do for you, you're absolutely right. Our communications experts will work with you in mapping out a strategy that'll satisfy your needs today, and for years to come.

For more information about Codex's forward thinking networking solutions, write Codex Corporation, Dept. 707-261, 20 Cabot Boulevard, Mansfield, MA 02048. Or call **1-800-426-1212, ext. 261.**

ONLY A NETWORK THIS MANAGEABLE

Are you in control of your data network? Or a slave to it? Locked into hardware that limits your options? Overburdened by maintenance? And trapped by multiple systems you can't manage?

The Information Systems Network from AT&T lets you take command. It's the only data network that allows you to integrate and manage your terminals, workstations, PCs, minis and mainframes as a single corporate-wide data network. It's the only network you can completely control.

You've got the whole network in your hands.

ISN's hierarchical star topology centralizes system administration and maintenance. The hub of the system is a fast-switching Packet Controller. It's linked to all data devices and manages all network functions. So, if one device goes down, the Packet Controller keeps your network up and running.

A System Control Console taps right into the Packet Controller. From this terminal, you can manage the network using simple English commands. You can add or move equipment, monitor network performance, track down faults and take corrective action—without disrupting network operations.

With a special password, you can perform maintenance functions from any asynchronous terminal in the system. And you have the option of remote maintenance from one of our service centers. ISN gives you multiple points of control.

You've got plenty of flexibility.

ISN links the devices in your network with twisted copper wire and fiber optics. It uses our Premises Distribution System wiring scheme which allows easy modular growth.

ISN is flexible and open to change. Start with as few as 50 devices and let it grow. ISN's open architecture allows you to easily add on new devices and new technologies as they emerge. ISN can take things as they come.

Linking multiple Packet Controllers lets you expand ISN to any size network. You can grow across one premise or across the country. And no matter how large your network gets, you choose the means of control—centralized or distributed. With ISN you're the boss.

You can bridge the communications gap.

What happens to your PBX? PC networks? Data processing systems? And all that hardware from Big Blue? ISN gets them all on speaking terms.

You can link ISN with the AT&T System 85 or AT&T System 75 PBXs. Whatever you have—data processing equipment and office

LETS YOU BE MASTER OF YOUR [illegible]

automation equipment; isolated Ethernets,™ AT&T's STARLAN PC Network and 3B Net; smart and dumb—ISN gets it all working together. All sharing the same resources. With you in total control.

And what about those IBM 3270s? ISN makes them work even harder. Now your 3270 terminals can access multiple IBM hosts. And low-cost dumb terminals can do the same. Asynchronous and synchronous traffic can travel through your network with the same speed and efficiency.

You can handle heavy traffic.

ISN maintains a high end-to-end transmission speed of 8.64 mbps, and a high throughput rate even when traffic is at its peak.

Long messages or bursty transmissions—ISN's been engineered to handle it all. A unique centralized short bus and perfect scheduling access method permit messages to travel through the network almost instantaneously. And arrive with their integrity intact. So there's no waiting. No bottlenecks. No retransmitting data.

You've made the right connection.

AT&T has a long history of solving complicated networking problems with clear-cut, intelligent solutions. We know how to tie it all together.

And we know how to work with you. Our professional sales and service people are with you every step of the way—[illegible] ing and maintaining a network that will meet your [illegible] today and tomorrow.

ISN reflects AT&T's better approach to office automation. To learn why it's the right choice for your business, call your AT&T Information Systems Account Executive, or 1 800 247-1212.

AT&T
The right choice.

Editorial Insider

Back to the Good Old Days?

In the old mill and mining towns of yesteryear, the townspeople bought their provisions from the company store — they had no other choice. The town's one main company employed them and sold them all their supplies. It was called keeping it all in the family.

In its quest for market share, IBM may be resurrecting those good old days by putting a lock on users' choices. It almost seems that prior commitment to IBM — and who isn't committed to IBM — may leave little for users to choose from in their communication needs. With its integrated approach to systems development, IBM is attempting to instill in users a cradle-to-the-grave solution that could lock up communications alternatives in the same way much of the computer hardware environment has been locked up.

IBM's aggressive pursuit of market share is clearly evidenced in its recent acquisitions and alliances. Its acquisition of Rolm Corp. provides a major entree into the PBX market and its new alliance with MCI Communications Corp. ensures access to a major long-distance carrier. The IBM-compatibles, in fact, may find themselves edged out as IBM tries to make systems that are more interdependent — meaning you can't get one piece of equipment without the other.

IBM, of course, is trying to challenge AT&T on that company's own turf. While AT&T is attempting to develop and market computers, IBM's strategy is to acquire telecommunications companies to quickly utilize their technologies in the coming battle between the two giants.

Almost all the major computer companies have adopted the "if you can't beat them, join them" philosophy in recent months. Digital Equipment Corp., Data General Corp. and Wang Laboratories, Inc. have recently announced or broadened their technology to connect their equipment with IBM. And AT&T will undoubtedly soon be offering hardware and software packages allowing its equipment to exchange documents with IBM mainframes.

While all of this market maneuvering is occurring, the MIS manager is still left with lots of gaping holes in IBM's telecommunications offering. This cloud hanging over any communications decision rests on what IBM will offer, particularly in local-area networks. The wait has been a long one, and no one is assured that it will be worth it.

So users are once again caught in the middle.The devil riding on every MIS manager's shoulder is the fear of making a decision that would make life more difficult in working with IBM's present and future product path.

IBM will call what's happening healthy competition, but users caught in the middle may have other words for it.

Not-So-Radical Perspectives

By Thomas Willmott

International Data Corp. has long tracked the progress of distributed resources systems (DRS) to describe the future of large organization computing architectures. In 1981, we looked forward to networks of processors that automated business functions far beyond the walls of the data center and that could, in fact, provide computing power and information access to a universal audience of end users. These concepts are driven by networking technology.

It is to be expected that all members of an organization — whether on the factory floor, in the reprographics center, throughout the administrative and sales offices or in the traditional data processing facility — would eventually be the beneficiaries of personal computing and global information access. This was a radical perspective, however, until recently.

DRS continue to evolve, and our research presently considers these three network categories: back-end (represented by high-speed mainframe connectivity), distributed data (reaching the local-area nodes) and microcomputer networks (that serve the work group). These distinct networks are complemented by gateway utility conversion products that have begun to tie together each piece of the DRS.

Back-end communications provide multimegabit-per-second file transfer among large CPU. IBM offers back-end channel adaptor technology to its customers, but the multivendor mainframe connection market is largely dominated by Network Systems Corp. (NSC) and its Hyperchannel products. NSC provides CPU adaptor devices and Netex, a proprietary network control program, to execute its high-speed network strategy. Paradyne Corp. and Masstor Systems Corp., while not providing precisely the same type of back-end products, are active participants in the market. Digital Equipment Corp.'s VAX Cluster is also a contender in the back-end communications battle that looms before us.

Distributed data networks are used to connect nodes on the next level of a processing hierarchy. Many of these installed networks conform to IEEE local-area network standards: 802.4 in manufacturing (General Motors Corp.'s Manufacturing Automation Protocol project is an good example); 802.5 token ring, which may be used to network multiple IBM System 36 or other departmental processors; and 802.3 carrier-sense multiple access with collision detection (CSMA/CD) Ethernet/Decnet, which corporations such as Ungermann-Bass, Inc. have had substantial success with. These distributed data networks typically provide for communications one level below the large data center CPU and one level above the individual's workstation.

At the low end — but by no means the least important — is PC Cluster. Substantial growth has occurred in this market over the past 12 months, and dramatic increases in microcomputer work group networks can be expected over the next three years. The technology here is clearly moving to IEEE 802.3 standards. A number of exciting young companies — 3Com Corp., Novell, Inc. and Sytek, Inc. are the first three that come to mind — are defining boundaries of the work group cluster.

The promise of global communications has not yet been kept. Gateway Technology and International Standards Organization (ISO) presentation standards are still evolving. Applications software integration in multivendor environments (and across multiple IBM systems) is still the Achilles' heel of DRS. IBM's Logical Unit 6.2 standards are promising, but usable products have yet to be delivered. Multiuser software for PC Networks is in alpha test, not in the office. And integration of voice and data networks continues to elude us.

Nevertheless, tremendous progress has been made in all areas of the communications industry. As the following pages attest, prospects for all types of networking products and companies have never been better.

Information Systems departments are excited by networking technology, and executive management has recognized the potential of DRS as a competitive tool.

■

Willmott is vice-president of user services for International Data Corp. in Framingham, Mass. and a regular columnist for Computerworld Focus.

Computerworld Focus

Computerworld Focus will be published 10 times in 1985. Remember, it's *your* publication. Send your comments on what you like and don't like and on what you want to see included to The Editor, Computerworld Focus, 375 Cochituate Road, Box 880, Framingham, Mass. 01701.

CW subscribers will continue to receive issues as part of their subscriptions.

MORE THAN 50,000 USERS HAVE PUT IN A PLUG FOR WANGNET.

When it comes to local area networking, Wang has all the business connections your company needs. In fact, Wang has been delivering their LAN system to businesses, both large and small, since 1981.

It's called WangNet. And today it's helping over 50,000 users keep pace with their ever-increasing communications needs.

WangNet ties your business together – today.

WangNet permits the concurrent exchange of text, data, graphics, electronic mail, and video at a rate of up to 10 megabits per second. And it can tie all of your organization's departments together, whether they're in one building or divided among several.

Because WangNet's dual broadband cable is installed much like electrical wiring, adding on new computer equipment is as easy as plugging in a lamp. So whatever networking needs arise, you'll be well prepared to meet them with WangNet.

The architecture is wide open.

Best of all, because WangNet is an open LAN, it allows you to tie most major office systems together. WangNet offers a transparent interconnection for over 300 switched or dedicated telecommunications channels, the IBM 3270 workstation-to-controller transport, and most video applications.

Considering all the information that's inundating today's office, there's no question that local area networking is a technology whose time has come. And with 50,000 people putting in a plug for WangNet already, the question is – isn't it time WangNet came into your business?

Get the facts.

To receive a copy of our latest WangNet brochure, call 1-800-225-9264. Or write to the Wang Business Executive Center, One Industrial Avenue, M/S 5413, Lowell, MA 01851.

WANG

We put people in front of computers.

Manager's Corner

Good Things Come to Those Who Wait . . .

By Jim Young

We have all heard the old platitudes — patience is a virtue, good things come to those who wait and watched pots won't boil and all the rest. However, given the current state of communications offerings, wait and see has become something of a necessity for today's data processing manager.

Indeed, biding time is almost a survival tactic today as managers try to anticipate the trends of communication technology, time their own investment, react to their organization's pressure for improved services and avoid premature commitment.

The experienced manager is lucky to have had a lot of on-the-job training in how to wait. When Winchester disk technology was introduced, years went by before products that fit into many environments were announced. When memory prices started falling dramatically, managers had to explain to impatient executives that their companies could not reap the benefits from lower-priced technology until leases on old equipment expired and, even then, would have to migrate to the new technology.

However, these improvements were all technical. Unless the speed of light can be increased, we can expect no basic change to the technology of communications. With the possible exception of fiber optics, the delay in the convergence of communications technology is for standardization and integration of known technology. But when the jigsaw puzzle comes together, it will have been worth waiting for.

After all, the potential of networks that could include all remote applications, all users, multiple vendors, batch and interactive transmissions, data and voice as well as document and image is enormous. Unfortunately, this environment is not available today.

Many growing pains affect the communications industry and leave most of today's offerings "not ready for prime time." Anyone who has tried to get true compatibility between modems from various vendors knows we are a long way from standardization.

Any hope for progress in merging technologies took a giant step backwards when the AT&T breakup occurred. Further delays can be expected as this new competitive environment tries to reconstruct the simplicity that existed before. This process will take some time as new vendors like IBM step into the arena and add new dimensions to the compatibility problem.

Today's managers must deal with a difficult situation — finding offerings that can fit into the existing environment. Several solutions exist for those with the luxury of starting from scratch. However, where existing data or applications must be included, either immediately or eventually, finding compatible communications products is difficult.

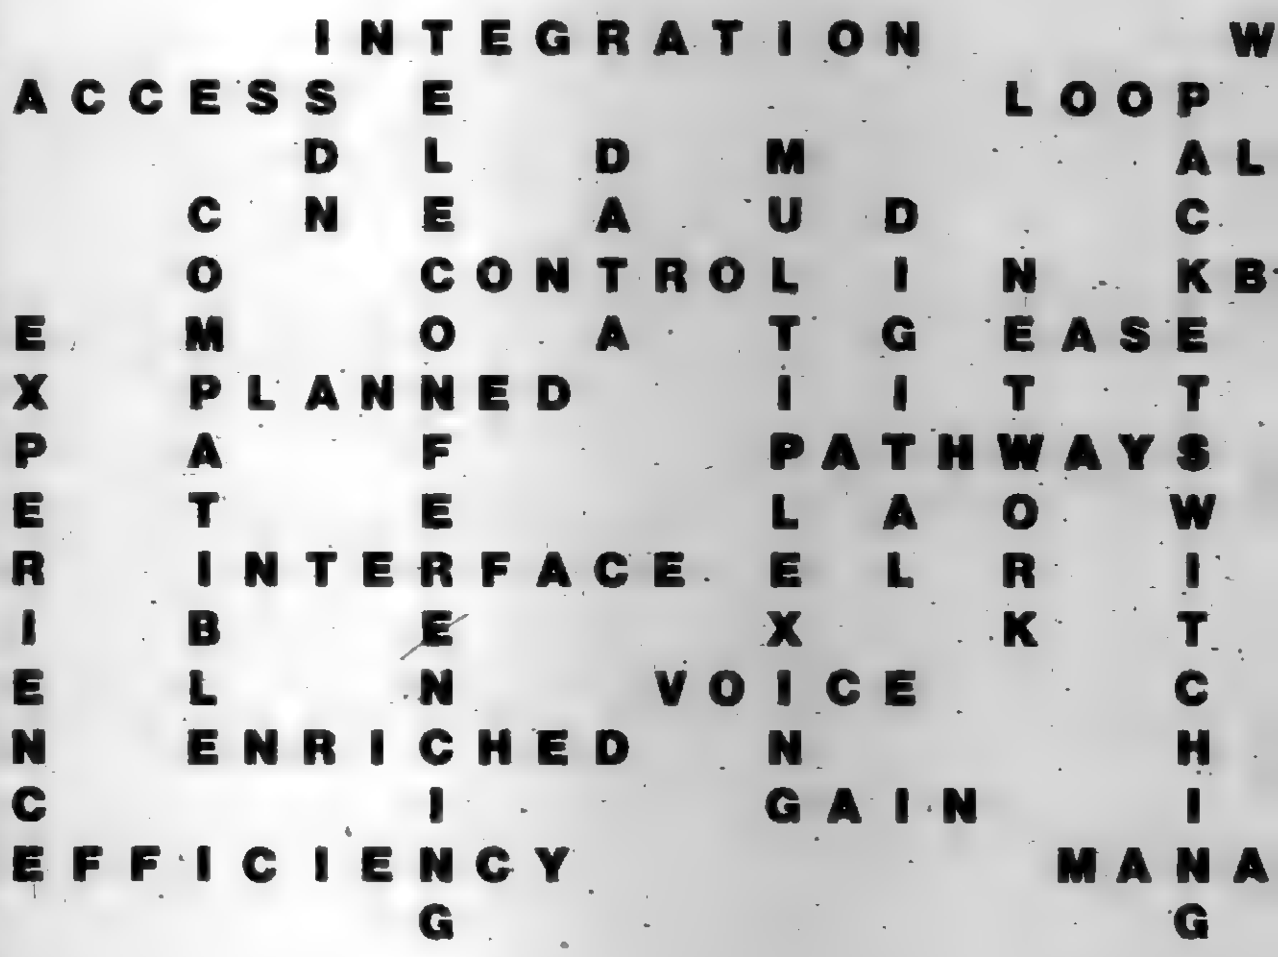
Local-area networks are a good example. When Datapoint first pioneered this concept with Arcnet, the problem was not that the company didn't have a fine product, but that it was hard to fit Arcnet within the then-typical DP network.

In a similar situation, the advent of voice-over data products has a real disadvantage — it is largely unable to work using existing wiring schemes and is therefore not practical unless a user starts all over again. To accommodate this possible future environment, DP managers can only hope to have a plan of how they can migrate to a future environment that is only a fuzzy concept today.

One waiting strategy is to pick a direction that looks promising and hope that as the whole architecture develops (one piece at a time), the total solution arrives on time and intact. This approach is not for the squeamish; investing in an undeveloped product may lead to a dead end or frustrating detours, as those who are pinning their hopes on products like Ethernet know.

The same drawbacks are true for IBM's SNA approach. The only difference is that a large number of people are betting IBM will once again be able to coerce the market. However, even the IBM followers are beginning to get an uneasy feeling as SNA takes shape around its various announcements. Other IBM products, such as document filing, do not fit within a smoothly integrated office environment, a key expectation of the communications environment. Moreover, long-term issues exist, such as those connected with potential voice or image protection: Will performance be there? Will IBM commit to necessary products? Once again, managers are forced to wait and see.

This confusion requires DP managers to take special care. Regardless of how aggressive or conservative a path one follows, some fundamental rules can be used to advantage, among them the following:



Now one word says it all.

Practically everything you need in digital communications in one word. *Pathways*™—advanced network services from the NYNEX telephone companies, New York Telephone and New England Telephone. Pathways services will link your business in ways you never thought possible. With peace of mind you never thought possible.

[redacted]

NYNEX Pathways services will include a wide range of digital operations that will eventually provide complete ISDN capability. But while Pathways services will be growing for years to come, you don't have to wait years to start. Already, your business can take advantage of services such as:

Digipath™ digital service, to provide multi-point data transmission that can send data at speeds up to 56 kbps with exceptional accuracy.

Superpath™ 1.5 mbps service, to transmit voice, data or images quickly and economically.

And before the end of 1985, we plan to introduce five new services:

Flexpath™ digital PBX service provides direct inward and outward dialing for digital PBXs over a 1.5 mbps facility.

Intellipath™ digital Centrex service that will offer a wide range of features directly throughout our network, rather than through premises equipment.

Infopath™ packet switching service allows economical and reliable transmission for interactive data applications.

Switchway™ switched 56 kbps service offers a cost-effective alternative

Manager's Corner

. . . But This Is Getting Ridiculous!

- Whether or not you want to commit to a technical direction, a strategy must be defined to include the applications that meet your business needs. Remember, even though communication capabilities can be elaborate, your needs may not be.

As you support your environment, focus your discussions around these applications. You can bring daydreaming executives and rabid vendors back to reality by talking in terms of the business benefits within your organization.

- Don't be afraid to commit to interim technology or products to solve specific localized needs. Just don't confuse this with a complete answer. The long-term solution will continue to grow in size and scope, but it's probably not on the market today.

- Beware of too stringent cost-benefit analyses.

Investment in a communications network pays back through the many applications that can use it. Frequently this takes time and the right combination of communications products. Culmination of this investment may take several years.

- Keep your technical skills and knowledge current at all times. New announcements constantly change the potential direction of this turbulent marketplace.

Begin building a strong technical staff whose skills can manage and grow a communications network. This talent will not appear overnight; it's best to start now.

- Keep an eye on what your colleagues are doing.

When the right combination of products is announced, others are sure to take advantage of integrated offerings, giving you a key tip-off to what may work in your environment.

Until the confusion of the communications environment straightens out, DP managers must understand the risks inherent in any long-term communications investment. The tremendous benefits available from an integrated communication network make it worthwhile to wait for the development of the proper products that will fit the larger picture.

Until this happens, all managers will have to become specialists in the techniques of waiting.

Q&A

Telecommunications consultant and noted industry analyst Dixon R. Doll is founder and president of the DMW Group, Inc., a consulting and research company in Ann Arbor, Mich. He recently shared with Computerworld Focus *some of his views on the current status and future directions of data communications.*

How far are we from true voice, data and image integration?

We're very slightly down the path. Some people paint a grand vision of the totally integrated all-digital network, but even in the middle of the twenty-first century there will probably be bits and pieces of those networks that won't be fully integrated.

Can you characterize the direction in which we're moving?

Where we're going can be characterized in terms of the networks, including all the transmission facilities, switchers and, to a great extent, many of the applications engines that drive the networks. All those will be based on the use of digital technology. Voice will become just another class of user of these digital nets. The model of the future is clearly the ISDN [integrated services digital network].

But that answer focuses only on the technology. We have lots of bits and pieces of the networks, but the deployment of the digital networks is more of a patchwork quilt. Many so-called networks only partially allow the objectives of universal networking to take place. And many networking products that the various vendors have pitched into the marketplace create incompatibilities and make it difficult for this universality to take place.

During the last two or three years, a tremendous wave of renewed interest has taken place in open networking. The major DP vendors in Europe decided the enemy was IBM. Then they decided they'd all be better off if they collaborated to develop common rules, standards and protocols that would allow all their machines to interconnect freely and to intercommunicate. This effort is paving the way for some improvements and enhancements and for the so-called OSI [open systems interconnection].

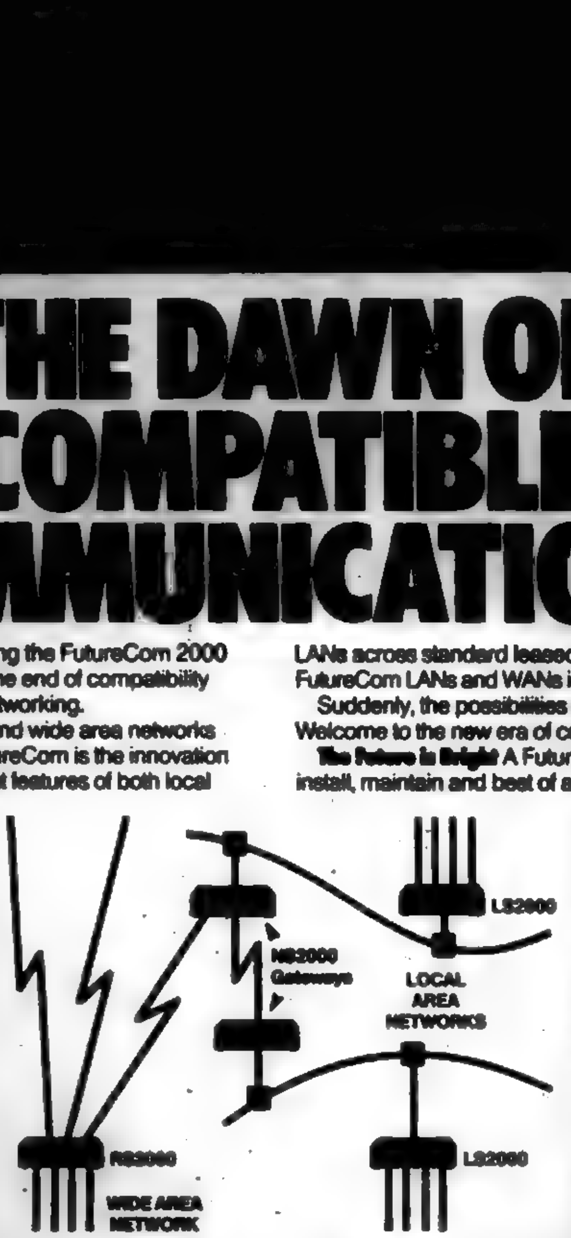
Do you think the U.S. will follow Europe's lead in banding together against IBM?

No. In the U.S., there is no belief that either the government or individual computer companies needs to compete against IBM. The two that will set the standards in the U.S. are AT&T and IBM. It won't be that much different from the case of local-area networking, where the battle was between supporters of the token passing ring and the Ethernet camp.

You'll also see joint ventures and collaborations. One good example is Wang and DEC in the office automation area; each company has announced it will comply with IBM's standards in the document interchange and document content architecture. Wang would most assuredly say that its main competitor is IBM and that its most important task is a coexistence strategy so customers don't have to choose between Wang and IBM.

Do you think that this concentration on the part of major vendors is going to further the shakeout of the smaller ones?

The shakeout we're seeing right now is a direct manifestation of the lack of concern many vendors have shown over developing broad-based communications strategies. Lots of Apples and IBM PCs bought in the last three years now sit around collecting dust. Why? Because they can't be attached to a local-area network, or they can't extract information or get at data necessary to run spreadsheet packages and decision support systems at the end-user workstation.



THE DAWN OF COMPATIBLE COMMUNICATIONS

FutureCom™ Is Here! Introducing the FutureCom 2000 Integrated Area Network™ and the end of compatibility and connectivity problems in networking.

Now you can combine local and wide area networks into a single unified system. FutureCom is the innovation you've been waiting for—the best features of both local and wide area networking in one powerful package.

FutureCom Local and Wide Area Networks FutureCom lets you design custom local and wide area networks. These networks may stand alone, or they may be easily combined to form your own Integrated Area Network. Different networks may be added later on, or the nature of the network may change, without sacrificing connectivity and compatibility.

The FutureCom LS2000 Local Server provides access for computer or terminal devices to an Ethernet LAN for efficient local resource sharing. The RS2000 Remote Server provides wide area connectivity via multiple RS-232 composite links (up to 4 per node).* Both servers support up to 32 channels and provide local and remote switching, port contention and advanced security features.

FutureCom Integration The key to the Integrated Area Network is the NS2000 Network Server, a bridge between Ethernet and RS-232. The NS2000 consists of one Ethernet link and up to four RS-232 links. Use it to connect multiple LANs across standard leased telco lines, and/or integrate FutureCom LANs and WANs into a single network.

Suddenly, the possibilities of networking are endless. Welcome to the new era of compatible communications.

The Future is Bright A FutureCom network is easy to install, maintain and best of all—to expand. ComDesign understands the implications of a network that cannot be changed and improved upon. FutureCom is designed for continuous growth and diversification, and will grow with you to keep your network in tune with your needs. Modular hardware and software design assures flexibility and adaptability, and additional channel capacity can be added in the field.

Find Out More The Integrated Area Network is the solution to your networking problems. Let us show you how easy it can be to design a FutureCom Network. Call us toll-free (800) 235-6935 in the Continental U.S., or in California (800) 368-8092 and ask for a free FutureCom brochure. ComDesign, Inc. 751 South Kellogg Avenue, Goleta, California 93117. Stacking the Deck With MCI Acquisition

IBM Corp. made an impressive move in its quest to become a serious player in the communications market recently when it announced its intention to acquire up to 30% of MCI Communications Corp. (MCI) of Washington, D.C. IBM's communications strategy in fact counterbalances rival AT&T's strategy in the computer field.

In the first place, IBM has unburdened itself of its unprofitable Satellite Business Systems (SBS) operation, handing it over to MCI. From its inception SBS had been an uncomfortable fit for IBM, according to a recent industry bulletin from International Data Corp. (IDC), a market research firm in Framingham, Mass. "From a strategic and organizational standpoint, [the agreement] is nothing but positive for IBM," the IDC bulletin pointed out. "IBM gets out of the day-to-day operations of SBS and gets SBS off of IBM's bottom line. IBM hands SBS over to a company with a good track record in long distance. IBM gets a major piece of what will be a much stronger long-distance carrier. The deal is a short-term, tactical retreat for IBM, but it is a strategically aggressive move in the long term." The move also gives MCI direct access to the confused but still-promising industry of satellite data communications. With an installed SBS base of 200,000 customers combined with its own customer base of 2.5 million, MCI could in a flash become more than twice as big as GTE Sprint Communications Corp. of Burlingame, Calif., the third largest long-distance telephone company.

MCI might also get the substantial backing it needs to expand its long-distance facilities while providing a path to the communications future beyond the intensely competitive and relatively unstable present market of long-distance telephone services.

For the lower tier competitors, the IBM/MCI venture does not bode well. GTE Sprint will be pressured to scramble for more customers, especially for high-volume business accounts (given MCI's access to SBS's 200,000 large customer accounts). James Broadhead, president of GTE's communications services group has stated GTE does not intend to change its present strategy, contending the MCI/IBM alliance is basically a tempest in a teapot. "It really doesn't show a major commitment by IBM yet," Broadhead said.

Others, such as Allnet Communication Services, Inc. in Chicago and United Telecommunications, Inc. in Kansas City, are thought by many industry watchers to be placed in jeopardy by the alliance. Allnet has announced its intentions to go into servicing specialized communications niches, which the larger companies might not find profitable enough. Charles Skibo, president of United Telecommunications, said his company would be increasing its development of private fiber-optic networks.

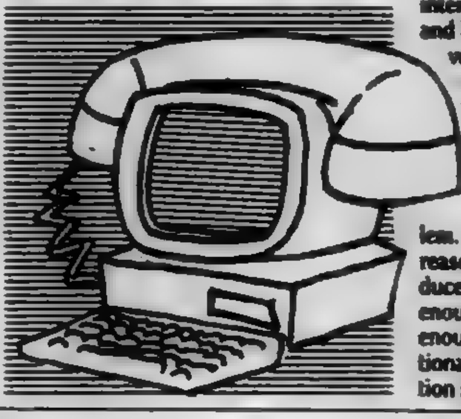
Some industry analysts are more blunt, predicting that a shakeout is around the corner unless the smaller long-distance companies can form some sort of consortium to bring economies of scale to bear on an intensely competitive market. If not, the long-distance telephone industry could become a two-company race.

Companies' OA Needs Drive PBX Selections

A study of office communications by New York-based Omni Group Ltd. found that 26% of decision makers surveyed considered their office automation communications needs exerted a heavy influence over their selection of a PBX system. An additional 60% said their communications needs exerted moderate influence in PBX selection. Only 14% said it had no influence whatsoever.

More than 500 OA purchasers in 2,000 large industrial companies and 2,000 large service companies in the U.S. were interviewed for the study, according to David Cushing, associate director of The Omni Group, a research and consulting firm specializing in technology.

Another study question asked what type of transmission medium was selected when respondents wished to have workstations communicate with each other. Approximately 39% of the respondents said they used current phone wiring; 35% said they installed new phone wiring; 18% said they used their existing data communications network (which includes IBM 3270 terminal wiring); and 8% said they used some other choice (primarily fiber optics).



What can be concluded from these statistics? According to Cushing, "The more people who said that their office communications needs drive their PBX purchasing decisions, the more people we could assume are getting into highly integrated voice and data applications in the office. Our results suggest that when corporations evaluate digital PBX equipment, office automation objectives are influential but not decisive."

Further information is available from The Omni Group, 115 E. 57 St., New York, N.Y. 10022.

Glitches, Expense Cause Satellites' Fall From Grace

Poised just a few years ago as the wave of the business data communications future, satellites are falling short of expectations.

Technical glitches and wrangling over international transmission techniques and broadcast boundaries slowed the development of satellite data communications in the late 1970s and early 1980s. Add to that the average $100 million cost of a satellite and the average satellite life expectancy — between seven and 10 years — and you have a problem. Why are satellites so expensive? One reason is that they are not mass produced. They have to be lightweight enough and their circuitry must be tiny enough to be carried into space by a National Aeronautics and Space Administration shuttle or a European Space Agency

Q&A

Vendors are paying the price right now, and they're all scrambling. John Young, head of Hewlett-Packard, said the solution to getting out of the jam is to broaden the communications capabilities and to become more effective in a systems integration role.

Are vendors following Young's advice?

Lots of examples are just beginning to hit the surface — the AT&T Information Systems/EDS joint venture and IBM's fledgling efforts to design custom networks that might possibly include other vendors' equipment.

Users are tired of being locked into dealing with only a narrow product set of particular vendors. They want single-vendor support with the ability to mix and match boxes and devices and special functions under the management leadership of the so-called integration vendor.

Did Apple err when it introduced the Macintosh and said it didn't have to talk to IBM?

Apple has already rewritten its strategy. The significance of Apple as a player in the computer industry will be a function of how well it coexists with IBM. If Apple had paid more attention to communications from the beginning, it wouldn't have found it so bloody difficult to get into the business environment. Apple should have had a greater sense of vision about what was important in communications when its products were closed off at the pass in terms of impacting the IBM business user.

You mentioned earlier that the two interconnect leaders will be AT&T and IBM. What will AT&T's role be?

AT&T's influence will be felt predominantly in the areas of the premises controller and the PBX and in its influence in the marketplace on standards for connectivity on the premises and in the long-haul market. AT&T has gone on record saying it will spend $500 million over the next few years enhancing the System 85 PBX. The company is a massive player and will have a very significant influence on the kinds of things people can do on the premises. AT&T will continue to utilize the PBX as a way of motivating customers to implement high-productivity OA applications — not necessarily keyboard-sensitive applications, but the more innovative ones like voice mail, teleconferencing and document composition distribution. It's already setting de facto standards in office wiring and cabling. Each time AT&T puts in a PBX, it usually gets its customer to put in [AT&T-recommended] wiring and cabling.

Does AT&T have a lock on that part of the market?

The trend in the marketplace is for both AT&T and IBM to separate the PBX selection process from the building wiring and cabling systems selection process. This trend is yet another manifestation of how AT&T and IBM are going to be the two leading factions in networking.

The vendor that supplies the PBX and the wiring and cabling system is going to be in a very attractive position with respect to getting a lot of additional add-on applications. That vendor will certainly be in a position to drive and control the local-area network protocols, so a lot of buying will be going on.

That's the good news. The bad news is this buying won't happen until companies are satisfied and comfortable that they can glue all this stuff together. It's going to take quite a few more years before all these problems are sorted out. In the meantime, systems integrators and internal telecommunications people will be in great demand.

Where are most users now?

Right now the vast majority of companies we work with have identified high-payoff application opportunities. One thing everybody is doing today is installing an all-digital backbone network deploying T1 facilities. The key to success in this type of undertaking is the ability to manage the T1 facilities as a network itself — to dynamically share the capacity across different applications.

— Lee White

In the News

rocket. Satellites must also be incredibly reliable because they can't be repaired when they are in orbit. Finally, the precision of their controls has to be exact, more so than for their terrestrial data communications counterparts. Even the smallest deviation in their controls can render the satellite inoperable and plot a course of disaster with no hope of recovery.

Though nations and international standards organizations are still coming to terms on broadcast boundaries, many of the transmission details have in the meantime been ironed out. Geostationary satellites operate in two frequency bands. The C band operates in the 4 to 6 GHz range, and the Ku band operates in the 12 to 14 GHz range. Antenna size is an inverse of frequency; a C band therefore needs a very large antenna.

To date, satellite data communications has had tepid response from U.S. businesses. Though satellites remain unsurpassed as the technology for broadcasting to remote distributed sites, most satellite business has come from government and private weather agencies and television broadcast stations, not from private business. Despite the growing improvement and miniaturization of sending and receiving earth stations, satellites are getting stiff competition from other forms of bypass technology such as fiber-optic and microwave networks. The latter networks often prove to be less expensive, more reliable data carriers and important links in long-distance terrestrial data networks.

Aggravating the situation is a glut of data communications satellites. Demand already is well below the supply of satellites now in geostationary orbit. Telesat Canada recently sold its Anik C1 satellite before it was scheduled to be launched, and companies such as Allstate Insurance Co. of Northbrook, Ill., and Merrill, Lynch, Pierce, Fenner & Smith, Inc. of New York are looking for buyers for part of their unused satellite capacity.

There is some hope. Mobile communications is one alternative. Many say the spread of mobile communications in the latter part of the '80s could provide a stimulus for satellite business communications. In this scenario, the satellite would provide the key link in a worldwide communications chain among mobile telephones.

A Surfeit Of Standards

In the beginning, there were too few communications standards; now there might be too many.

That's the opinion of Subhash Bal, vice-president of marketing for Excelan, Inc., a network vendor in San Jose, Calif.

Communication standards are beneficial, Bal explained, because they bring down costs and help the industry grow. In light of the current computer industry slump, Bal said, users are going to pressure vendors to "standardize" on fewer standards.

"In any given organization or department there is always a variety of systems. The time has come for people to get more out of existing systems by making them communicate with each other. It's impossible with so many operating systems and vendors. The only way is to adopt a standard and eliminate the differences in the operating systems among computers."

According to Bal, the time might be near. Standards in communications can be divided into two areas. The first is the standard related to the medium itself and includes things like Ethernet, baseband and broadband, token bus or token ring, speed of transmission. These characteristics are based on the actual physical connection of the network.

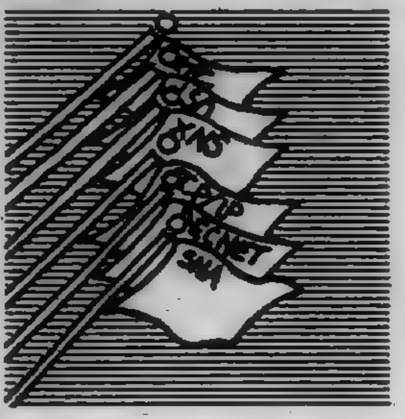
The second area that Bal classified as more important is the communications protocol, the set of conventions by which two computers can "talk to and understand each other." Bal likened this area to the ability of two people to carry on a conversation in a certain language.

A number of communications protocols exist — Decnet from Digital Equipment Corp. and XNS from Xerox Corp., for example. Some are better than others, but Bal believes the transmission control protocol/internet protocol (TCP/IP) may have a good chance to succeed. TCP/IP is available, complete (after 15 years of work by the U.S. Department of Defense, its developers), well documented and growing in popularity.

IBM's Systems Network Architecture (SNA), celebrating its 10th birthday, will be around for a long time simply because it is IBM. Otherwise, it has network shortcomings, Bal noted. SNA works in a layered, hierarchical network approach, as contrasted with the peer-to-peer approach TCP/IP, XNS, Decnet and others offer. "Most people install SNA emulators," Bal explained, "when they wish a non-SNA computer to talk to another computer that is on the SNA network. It simply provides a way to make the outside computer act like an IBM terminal to communicate with the IBM 370 computer on SNA."

Bal had some predictions for five years down the road: the eclipse of more proprietary networks such as Decnet and XNS; the beginning of the decline of fast riser TCP/IP; and the emergence of the still-to-be-completed International Standards Organization (ISO) protocol, which he thought would be the big data communications winner.

"It is well documented, has international support and is already the basis for General Motors Corp.'s Manufacturing Automation Protocol, a force in the industrial sector. There is tremendous momentum for the ISO protocol," Bal concluded.



In Brief

FRANKLIN LAKES, N.J. — Implementation of the integrated services digital network (ISDN) communications protocol in the U.S. is inevitable, but will evolve slowly over the next 15 years with limited network capability appearing in about five years, according to a recent study announced by the Perspective Telecommunications Group, a telecommunications consulting firm. The study also concluded that the primary market for ISDN will be intra-local access and transport area network applications, and the major beneficiaries will be local telephone companies and user corporations with sufficiently diverse circuit requirements to utilize ISDN.

Further information is available from Perspective Telecommunications Group, 808 High Mountain Road, Franklin Lakes, N.J. 07417.

RYE BROOK, N.Y. — IBM is adopting the Phonemail voice messaging system from Rolm Corp. of Santa Clara, Calif. Rolm has also announced a new version of Phonemail to serve companies that do not have Rolm private branch exchange or Centrex systems.

IBM said it will combine with Rolm in marketing Phonemail and IBM's other messaging products. IBM added that it will no longer actively market the audio distribution system, its existing voice messaging system, in the U.S. It will, however, provide central service support for ADS through 1986.

FRAMINGHAM, Mass. — The microwave systems market will approach $500 million by 1989, according to *Microwave Market*, a report published by International Data Corp.'s Communications Industry Research program. The report stated the 1989 figure will be double the 1984 market of $250 million and will experience a growth rate of 16% annually, spurred by trends toward private networks, compatibility with other transmission alternatives and technological advancements. By 1989, the study said, the private carrier segment will be 42% of the total communications market.

Further information is available from International Data Corp., 5 Speen St., Framingham, Mass. 01701.

PARSIPPANY, N.J. — Deregulation has been mostly or extremely beneficial to their industry, their companies and their customers, according to almost half of top-level executives surveyed in a recent research study by Trinet, Inc., Parsippany, N.J., and the Gallup Organization, Princeton, N.J.

Of the executives surveyed from the communications side, 49% of respondents said deregulation was beneficial to their industry, 47% said it was beneficial to their company and 34% said it was beneficial to their customers. The report indicated the low communications customer figure of 34% was a result of customer confusion and "upheaval" in the industry as a result of the AT&T divestiture. For further information contact Trinet, Inc., 9 Campus Drive, Parsippany, N.J. 07950.

DALLAS — Common carriers should start developing business plans for marketing integrated services digital network (ISDN) services, according to Al Boschulte, vice-president of Pacific Bell, San Francisco, Calif. Speaking at a recent International Communications Association meeting of telecommunications managers, Boschulte stressed that involvement of sophisticated users in the evolution of ISDN is crucial for assuring widespread operating efficiencies.

Market demand for ISDN will revolve around issues such as customers controlling their own networks, transmission predictability, an integrated features package and cost-efficient pricing, Boschulte added.

ROCHESTER, N.Y. — The Eastman Kodak Co. will enter the fiber-optics market through its newly formed Lamdek Fiber Optics division.

Lamdek will initially market a "high-precision field-installable" connector and related products for single-mode optical fiber. The company said the connector utilizes aspheric glass lenses to expand the optical fiber light beam, providing what Lamdek claims to be a high-quality durable connection between single-mode fibers.

Kodak said the fiber-optic connector will be available in the U.S. and Canada by the end of 1985, followed by its introduction into some international markets by late 1986. Citing industry analysts, Lamdek said the fiber-optics communications market in the U.S. is expected to grow to nearly $2 billion by 1990, the market for connectors alone accounting for nearly $200 million of that figure.

RESTON, Va. — A new annual conference on telecommunications and end-user computing has been announced by the National Computer Conference Board. Called NCC-Telecommunications, the show will first be held Sept. 8-10, 1986, at the Philadelphia Civic Center. It will be sponsored by the American Federation of Information Processing Societies, Inc. (Afips).

Spokesmen for NCC-Telecommunications said the new show will include technical sessions and professional development seminars combined with a full exhibit program representing major manufacturers of advanced integrated technologies and telecommunications products and services. For further information write Afips, 1899 Preston White Drive, Reston, Va. 22091.

By Stan Kolodziej

Corporate executives are taking a hard look at the micros in their offices, and what they're seeing is the result of several years of high-rolling buying practices. What's more, not only have these micros grown more expensive; they've also been utilized less than management first anticipated. To meet end-user demand and to utilize these micros better, management information systems departments are searching for ways to bring more corporate data to the micro. As a result, micro-to-mainframe link vendors are being kept very busy.

The micro-to-mainframe link has been both a buzzword and a subject of speculation for some time now. Why so much controversy? One reason is that micro-to-mainframe products can be confusing. Simple on the surface, these products in fact can become a cat's cradle of hardware, software, communications and file conversion levels.

The most common mistake users make is assuming a micro-to-mainframe product is some plug-in panacea that will instantly merge micro and mainframe into a completely integrated computer system. Not so. Micro-to-mainframe products can be as simple as the basic conversion of mainframe data to Ascii format and slow (300 bit/sec) asynchronous transmission to a personal computer emulating a terminal. It can also be as complex as a real-time transaction processing system employing mainframe software, specialized controllers, expensive protocol conversion software and long-distance full-duplex communications at 19.2K bit/sec.

Another common mistake is the assumption that when data from the mainframe has been transferred to the micro, it can be handled like any other data on the microcomputer. Some users have

Rumor has it you're moving up to T1.

Come back.

T1 speed.

It doesn't have to be as scary a project as everyone thinks. Fact is, installing T1 can be a fairly simple chore.

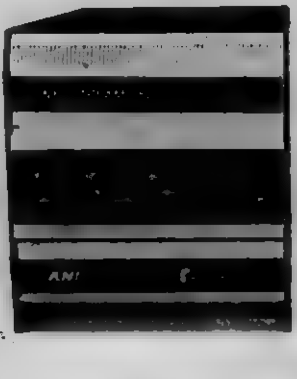
We're Infotron.
We design, build, and install communications networks. Reliable. Compatible. Sophisticated T1 networks that support data and compressed digital voice.

Our newest system, InfoStream™, introduces an open architecture to T1 networking based on Infotron's long-established strengths in multiplexing and switching.

We'll take care of you every step of the way. Before. During. And after the sale.

Calm down. Dust yourself off. Then call: 800-345-4636.

INFOTRON SYSTEMS



been surprised that a file transferred from an IBM machine running Vsam cannot, without difficulty, be loaded into a spreadsheet program written for PC-DOS and the IBM PC. Data must first be converted into proper file format.

For micro-to-mainframe links to work properly, the user should be aware that three areas have to be addressed:

- The actual method used to connect the micro to the mainframe.
- The communications method for transferring data.
- The actual conversion process used to get the data into a workable format on the micro.

The micro-to-mainframe connection can be either through a direct physical link such as hardwiring with a coaxial cable or through a modem and telephone hookup.

The communications method for transferring data, however, is not so straightforward. Communications software can lie in the firmware of a personal computer's expansion board, can be loaded from floppy disks or can be resident on the host mainframe. Such software allows a personal computer to handle the specific communications protocols given by the host mainframe. Speed is important. Some communications protocol converters can only handle transmission speeds of 1,200 or 2,400 bit/sec. For most batch or casual micro-to-mainframe processing, this speed is adequate for downloading data. Real-time transactional processing, however, needs something more like 9,600 bit/sec and up.

The third link in the micro-to-mainframe chain, the process used to convert data into a workable format, is the most important. The evolution of multivendor computer installations has helped create entire niche industries of protocol conversion products.

As is true of so many other areas of the computer industry, protocol conversion is an IBM-driven market. Perhaps the oldest and still largest market for converters involves IBM 3270 terminal emulation, followed a distant second by the market for DEC VT 100 terminal emulators.

Terminal emulators are the fast food of the micro-to-mainframe industry: They are mass produced, and they seem to be everywhere. Today's market for terminal emulators centers primarily on making an IBM PC act like or emulate an IBM 3270 for communicating with one of the large installed bases of IBM mainframes.

Terminal emulation in its simplest guise consists of using utility software, hardware expansion boards or a combination of both in such a way that the microcomputer is made to act like a terminal. By "fooling" the mainframe, the emulated terminal can instruct the host to present information to the terminal following protocols established by the host systems software. In other words, the two can talk in the same language. Terminal emulators have one major drawback, however; when the terminal and host are in session, that's all the terminal can do. The emulating micro cannot actually process incoming data until talks have been broken off.

Two of the most popular emulation boards are the Irma board from Digital Communications, Inc. (DCI), Norcross, Ga., and the Blue Lynx from Techland Systems, Inc., New York, N.Y. Both boards retail in the $1,000 range.

Most emulation board products offer only basic micro-to-mainframe functionality. Because the micro becomes a dumb terminal during emulation, it cannot be used for local functions until it has been disconnected from the host. Users who want to process mainframe files are finding they must follow the path many corporate users are taking: They first develop programs to extract the necessary information from the large mainframe files and then input the data into personal computer software formats such as the document interchange format (DIF). DIF, developed jointly by the U.S. Department of the Navy and the National Bureau of Standards, has been adopted by several major word processing vendors as the standard for transferring text between different WP systems.

Although many are similar, no two emulation board products are alike. The Blue Lynx board handles standard functions such as conversion to Ascii and local storage of 3270 files, but it also comes bundled with a utility software program that runs on the IBM PC and converts Ascii files into applications software formats such as Lotus Development Corp.'s 1-2-3, Ashton-Tate's Dbase II and the DIF standard.

Terminal emulators are not just for microcomputers. Before micros, terminal-to-terminal emulation (turning a Wang OIS terminal into an IBM 3270, for example) was and still is good business.

So-called independent micro-to-mainframe links are also big business. These products, which generally consist of software running on the mainframe or the micro, are usually produced by smaller companies unaffiliated with specific mainframe hardware or software products. Most of these software links require — but do not usually include — communications hardware such as the Irma or Blue Lynx boards. In addition to file format conversion to DIF, Ascii or other file formats on the personal computer, these links also usually offer some sort of security feature, either in the form of a data dictionary or an interface to the security already in the mainframe. Where these products excel, however, is in protocol conversion.

Software-driven links can involve cost savings because no additional hardware is required. But those savings could be offset by the cost of multiple asynchronous ports on the host as well as by the potential increase in host memory requirement.

One example of an independent software link comes from Linkware Corp. of Waltham, Mass. Linkware recently introduced a series of file conversion products that link various popular personal computers with DEC VAX and IBM mainframes. Other examples of software links are Tempus Link from Micro Tempus, Montreal, and that company's recently introduced Tempus Data, the latter being mainframe software allowing PC users to select and extract data from IBM mainframe data management software access methods such as Vsam, Isam, Qsam and IDMS.

These products are more sophisticated than simple terminal emulators, and their price tags reflect that fact. Linkware's prices range from $6,000 up; the Micro Tempus line ranges from $7,000 to $12,000; and more advanced mainframe-based links, such as PC Link from McCormack & Dodge of Natick, Mass., can run well over $30,000. For the extra price you can expect to get enhancements such as advanced security features, uploading into an IBM mainframe data format and full on-line Help and documentation.

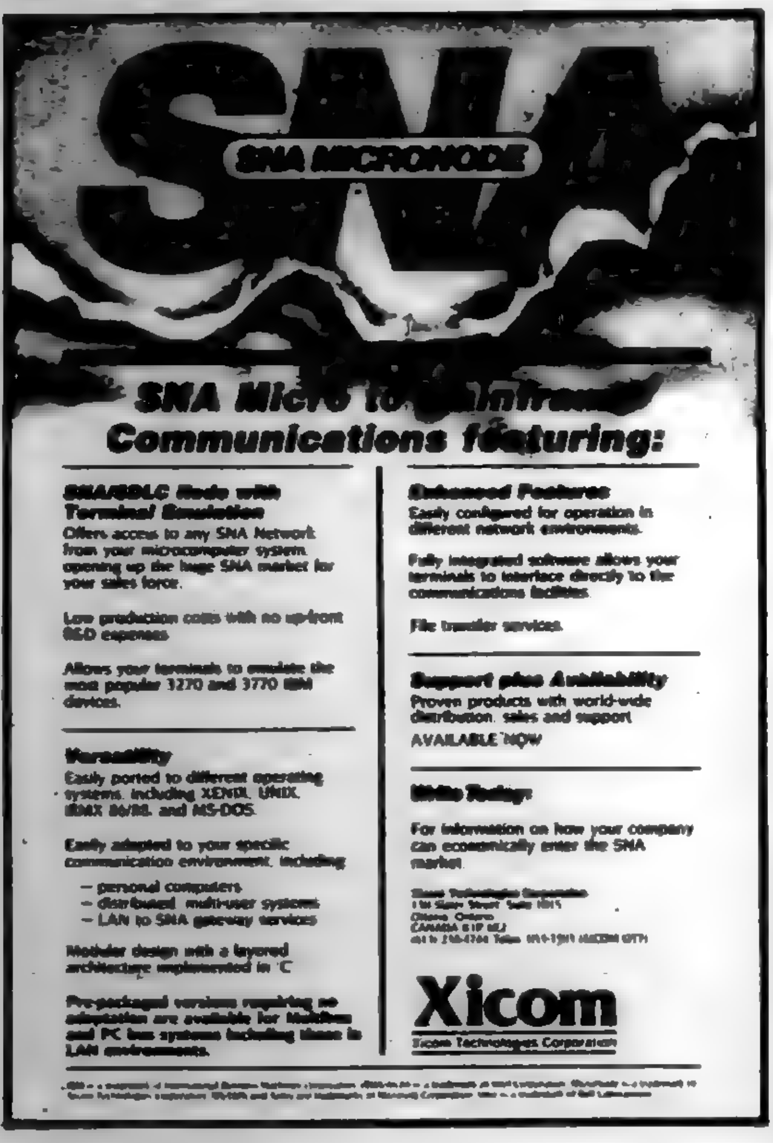
The most popular type of independent link is hardware-driven. A link of this type replaces the host controller (usually an IBM 3274 or 3276) with a hardware product that attaches directly to asynchronous terminals. The controller-emulation function of the protocol converter responds to polls from the host, collects the received blocks of data and then performs code conversion. The controller also emulates an IBM terminal by accepting keystrokes from the terminal keyboard and then interprets the characters according to the data editing rules of the 3278 terminal.

Another hardware link method is disk-to-disk conversion. Disk to disk does not depend entirely on a communications link; instead, all of its data protocol conversion is accomplished within a self-contained unit. A major vendor in this area is Altertext, Inc. The $15,000 Altertext System II is about the size of a microcomputer and features a 12-in. monitor, a keyboard, up to six asynchronous and/or bisynchronous communications ports and four 8-in. and 5¼-in. floppy disk drives. Disk-to-disk software transfers information directly from one type of disk to another. The system translates information from one disk into A-Code — Altertext's central code set controlling the two-way exchanges — and from A-Code to the target system's format.

The most common complaint generally heard about protocol converters is the lack of performance, resulting in delayed response times. The burden of handling the host protocol and at the same time handling several terminals can make some hardware converters (especially those with single processors) drag their feet.

One of the fastest growing areas of micro-to-mainframe links concerns tapping into IBM's popular Distributed Office Support System (Disoss), which resides on an IBM MVS mainframe and helps IBM's office systems exchange documents. A number of third-party vendors are making a career of providing interfaces between the Disoss architecture and the products of various office automation vendors such as NBI, Wang, Xerox Corp. and Data General. Soft-Switch, Inc. of King of Prussia, Pa., was one of the first companies to bring such a product to market when it introduced its Soft-Switch Disoss link.

From these rather specialised micro-to-mainframe products, some vendors are beginning to join forces to provide a more integrated solution to customers. In the past few months, joint venture and marketing agreements among some vendors have led to some interesting micro-to-mainframe offerings. One example is the agreement between mainframe software vendor Cullinet Software, Inc. of Westwood, Mass., and DCI. Under this



SNA Micro to Mainframe Communications featuring:

SNA/SDLC Node with Terminal Emulation
Offers access to any SNA Network from your microcomputer system, opening up the huge SNA market for your sales force.

Low production costs with no up-front R&D expenses.

Allows your terminals to emulate the most popular 3270 and 3770 IBM devices.

Versatility
Easily ported to different operating systems, including XENIX, UNIX, iRMX 86/88, and MS-DOS.

Easily adapted to your specific communication environment, including
- personal computers
- distributed multi-user systems
- LAN to SNA gateway services

Modular design with a layered architecture implemented in 'C

Pre-packaged versions requiring no adaptation are available for Multibus and PC bus systems including those in LAN environments.

Enhanced Features
Easily configured for operation in different network environments.

Fully integrated software allows your terminals to interface directly to the communications facilities.

File transfer services.

Support plus Availability
Proven products with world-wide distribution, sales and support.
AVAILABLE NOW

Write Today:
For information on how your company can economically enter the SNA market.

[illegible]

arrangement, Cullinet produced its Information Database link software to handle communications links with DCI's popular Irma emulation boards. Cullinet's Goldengate PC integrated software package has also been equipped with the ability to enter mainframe extraction requests in a spreadsheet cell.

Compared with other computer markets, the micro-to-mainframe product market is tiny, but it looks forward to steady if not spectacular growth. U.S. revenues from the combined categories of general purpose communications software, dedicated terminal emulation products and intelligent/integrated links (including the revenue derived from the mainframe software content of the links) reached nearly $60 million in 1984, according to estimates from Natick, Mass.-based Venture Development Corp. This figure will reach $400 million by 1990, the research firm said, despite continuing confusion on the part of users toward the many types and technologies in the micro-to-mainframe area.

If IBM begins selling near what it predicted for its PC Networks, an area sure to heat up is a link between IBM's SNA mainframe environment and its PC Network.

Helping with revenues is a small subindustry that is starting to provide gateways between local-area networks and mainframes. Such links are new, largely because users of local-area networks — especially the newer PC nets — are still busy trying to figure out what to do with them. For those apparently lucky enough to have solved this problem, a few PC local-area net/mainframe products are now waiting.

Most of these local-area network/mainframe gateways employ some sort of file server or controller to handle data distribution and protocol conversion between the mainframe and the local net.

The Network Data Mover (NDM) and Network Access Services (NAS) products from The System Center in San Mateo, Calif., provide links between Corvus Systems' Omninet local-area networks and IBM mainframes, utilizing Systems Network Architecture (SNA) protocols. NAS resides on the local net gateway and gives IBM SNA access to any applications running on the PCs. NAS software is bundled into the gateway, and the combined product sells for about $9,000. NDM is an application program that moves files from one processor to another. NDM is actually two products: NDM/MVS for mainframes and NDM/PC for the local-area network.

Another gateway product, Virtual Networking System (Vines), was introduced by Banyan Systems, Inc. of Westboro, Mass. Vines centers around a 32-bit, Unix processor functioning as a network server, data dictionary, protocol converter and communications gateway. The front end of Vines supports a variety of personal computers and local nets (up to a total of four local nets simultaneously, including Ethernet, Omninet, Applenet and the IBM PC Network).

The back end of the processor communicates with host computers and other Banyan servers connected to other remote or local-area networks. The back end provides access to host applications, files and electronic mail through terminal emulation. Streettalk, the system's security software, is bundled into the system.

Other gateway products are available from Intel Corp. of Santa Clara, Calif., with its Intel Database Information System (Idis) featuring a local processor with software to access mainframe data bases and software to support local processing; and from Interlan, Inc. of Westford, Mass., whose NTS10 provides protocol conversion from and to users on an Ethernet network and IBM hosts (though no SNA links are provided).

Another area sure to heat up (if IBM can begin selling near what it originally predicted for its PC Networks) is a link between IBM's SNA mainframe environment and its PC Network. IBM has begun shipping its PC Network/SNA 3270 Emulation Program and has also announced a Series 1 PC Connect that allows the Series 1 minicomputer to act as a gateway between a PC Network and a mainframe running SNA. One of the few other SNA/PC Network links is from California Network Systems of Milpitas, Calif. That company's PC Network/SNA gateway software package, like IBM's, is available at $375 per user. California Network Systems, however, claims it offers a clearer migration path toward an eventual support of 48 concurrent sessions and does not, unlike the IBM product, require a dedicated PC as a gateway. At this stage, other PC network companies are keeping watch. This is a fledgling market. If IBM's SNA gateway begins to sell in volume, however, you can be sure those companies will soon jump in with its own better SNA mousetrap.

Announcing

The one-stop, international advertising service for micro marketers.

You'll reach microcomputer buyers all over the world with *Computerworld's* International Marketing Service (CWIMS). Because we have the microcomputer market *covered* with an international network of publications. And what a market!

As the need for computerization in government, industry and educational systems all over the world becomes more acute, countries look to the cost-effective, adaptable microcomputer to bring them into the computer age. This means a very lucrative market for the U.S. micro marketer, since international product demand exceeds product supply.

Now, with the help of *Computerworld's* International Marketing Services, you can advertise in twenty magazines devoted exclusively to supplying information to microcomputer users in: Australia (*MicroWorld, Australian PC World*), Brazil (*MicroMundo*), Canada (*PC World Canada*), Denmark (*Micro Verden*), Finland (*Mikro*), France (*Golden, OPC*), Japan (*PersoCom World*), Mexico (*Compu Mundo*), Norway (*Mikro Data, PC Mikrodata*), Sweden (*MicroDatorn, Mix Hemdator*), Spain (*Micro Sistemas*), Sweden (*Svenska PC World*), The Netherlands (*Micro/Info*), West Germany (*MicroComputerwelt, PC Welt, Run*). And your advertising message can reach buyers of microcomputer products and services around the world through special micro sections in any of over 40 publications in 25 countries.

Act now—and take advantage of this international demand for microcomputer products. Whether you want to test the market—or locate a distributor or representative—our publications will put you in touch with the right people around the microcomputer world.

For more information on getting international micro coverage, call Diana La Muraglia, General Manager, International Marketing Services, toll-free, at 800-343-6474. In Massachusetts, call 617-879-0700 or return the coupon below.

IBM's LOCAL-NET POLICY: WHEN WILL IT SURFACE?

IBM's local-area network announcements send ripples through the industry each time they appear in the press. What is the strategy behind these seemingly disparate network pieces? Is there a strategy?

BY BRIAN JEFFERY

Are we all clear on IBM's local-area network strategy? There's the token ring, which will be available in 1986 or 1987 if it's not introduced in 1985. It's the strategic product everyone is waiting for, although it's going to be unpleasantly expensive and fits in more with the Systems Network Architecture (SNA) 3270 world than anywhere else. It runs on the IBM Cabling System, which consists of five — or possibly seven — types of cable, and it has something to do with the Rolm Corp. CBX II, or possibly it doesn't. It will support virtually all of the IBM product line, but not right away.

Then there's the PC Network, which IBM announced in three versions: a 72-device configuration available through IBM and distributors; a 255-device configuration, which IBM won't sell; and a custom configuration supporting several thousand devices, but IBM won't sell that either. PC Network supports Personal Computers and the Series/1, but, although the PC Network is aimed at corporate departments, it doesn't support the System/36, IBM's much-vaunted "departmental system."

IBM's working with Sytek, Inc., (broadband commitment) and Ungermann-Bass, Inc., (Ethernet commitment) but it's not supporting broadband or baseband coax for the token ring.

IBM is committed to the PC Network for attaching PCs in small groups, but IBM sales forces will also peddle Cluster Kit (the local-area network IBM said wasn't a local-area network); Corvus Systems, Inc.'s Omninet; Nestar Systems, Inc.'s Plan; and Orchid Technology, Inc.'s PC-Net — assuming they're not instead pushing a low-end System/36.

If this sounds confusing, it is. The main problem is IBM has been developing, describing and even introducing local-area networks for years without a single central plan. Only in June 1985 was a single unit formed to coordinate product and marketing directions, and only recently has IBM had anything that can reasonably be described as a local-area network strategy.

As is so often the case with IBM, strategy for local-area networks has been a case of piecing together a set of products developed by different IBM units with little or no coordination with the others, using different technologies and approaches, all incompatible. The situation is reminiscent of the confused office automation direction pattern that resulted when different IBM divisions peddled different office systems in the late 1970s and early 1980s.

The story goes something like this. In the beginning was the token ring. In the late 1970s, IBM got rather worried about

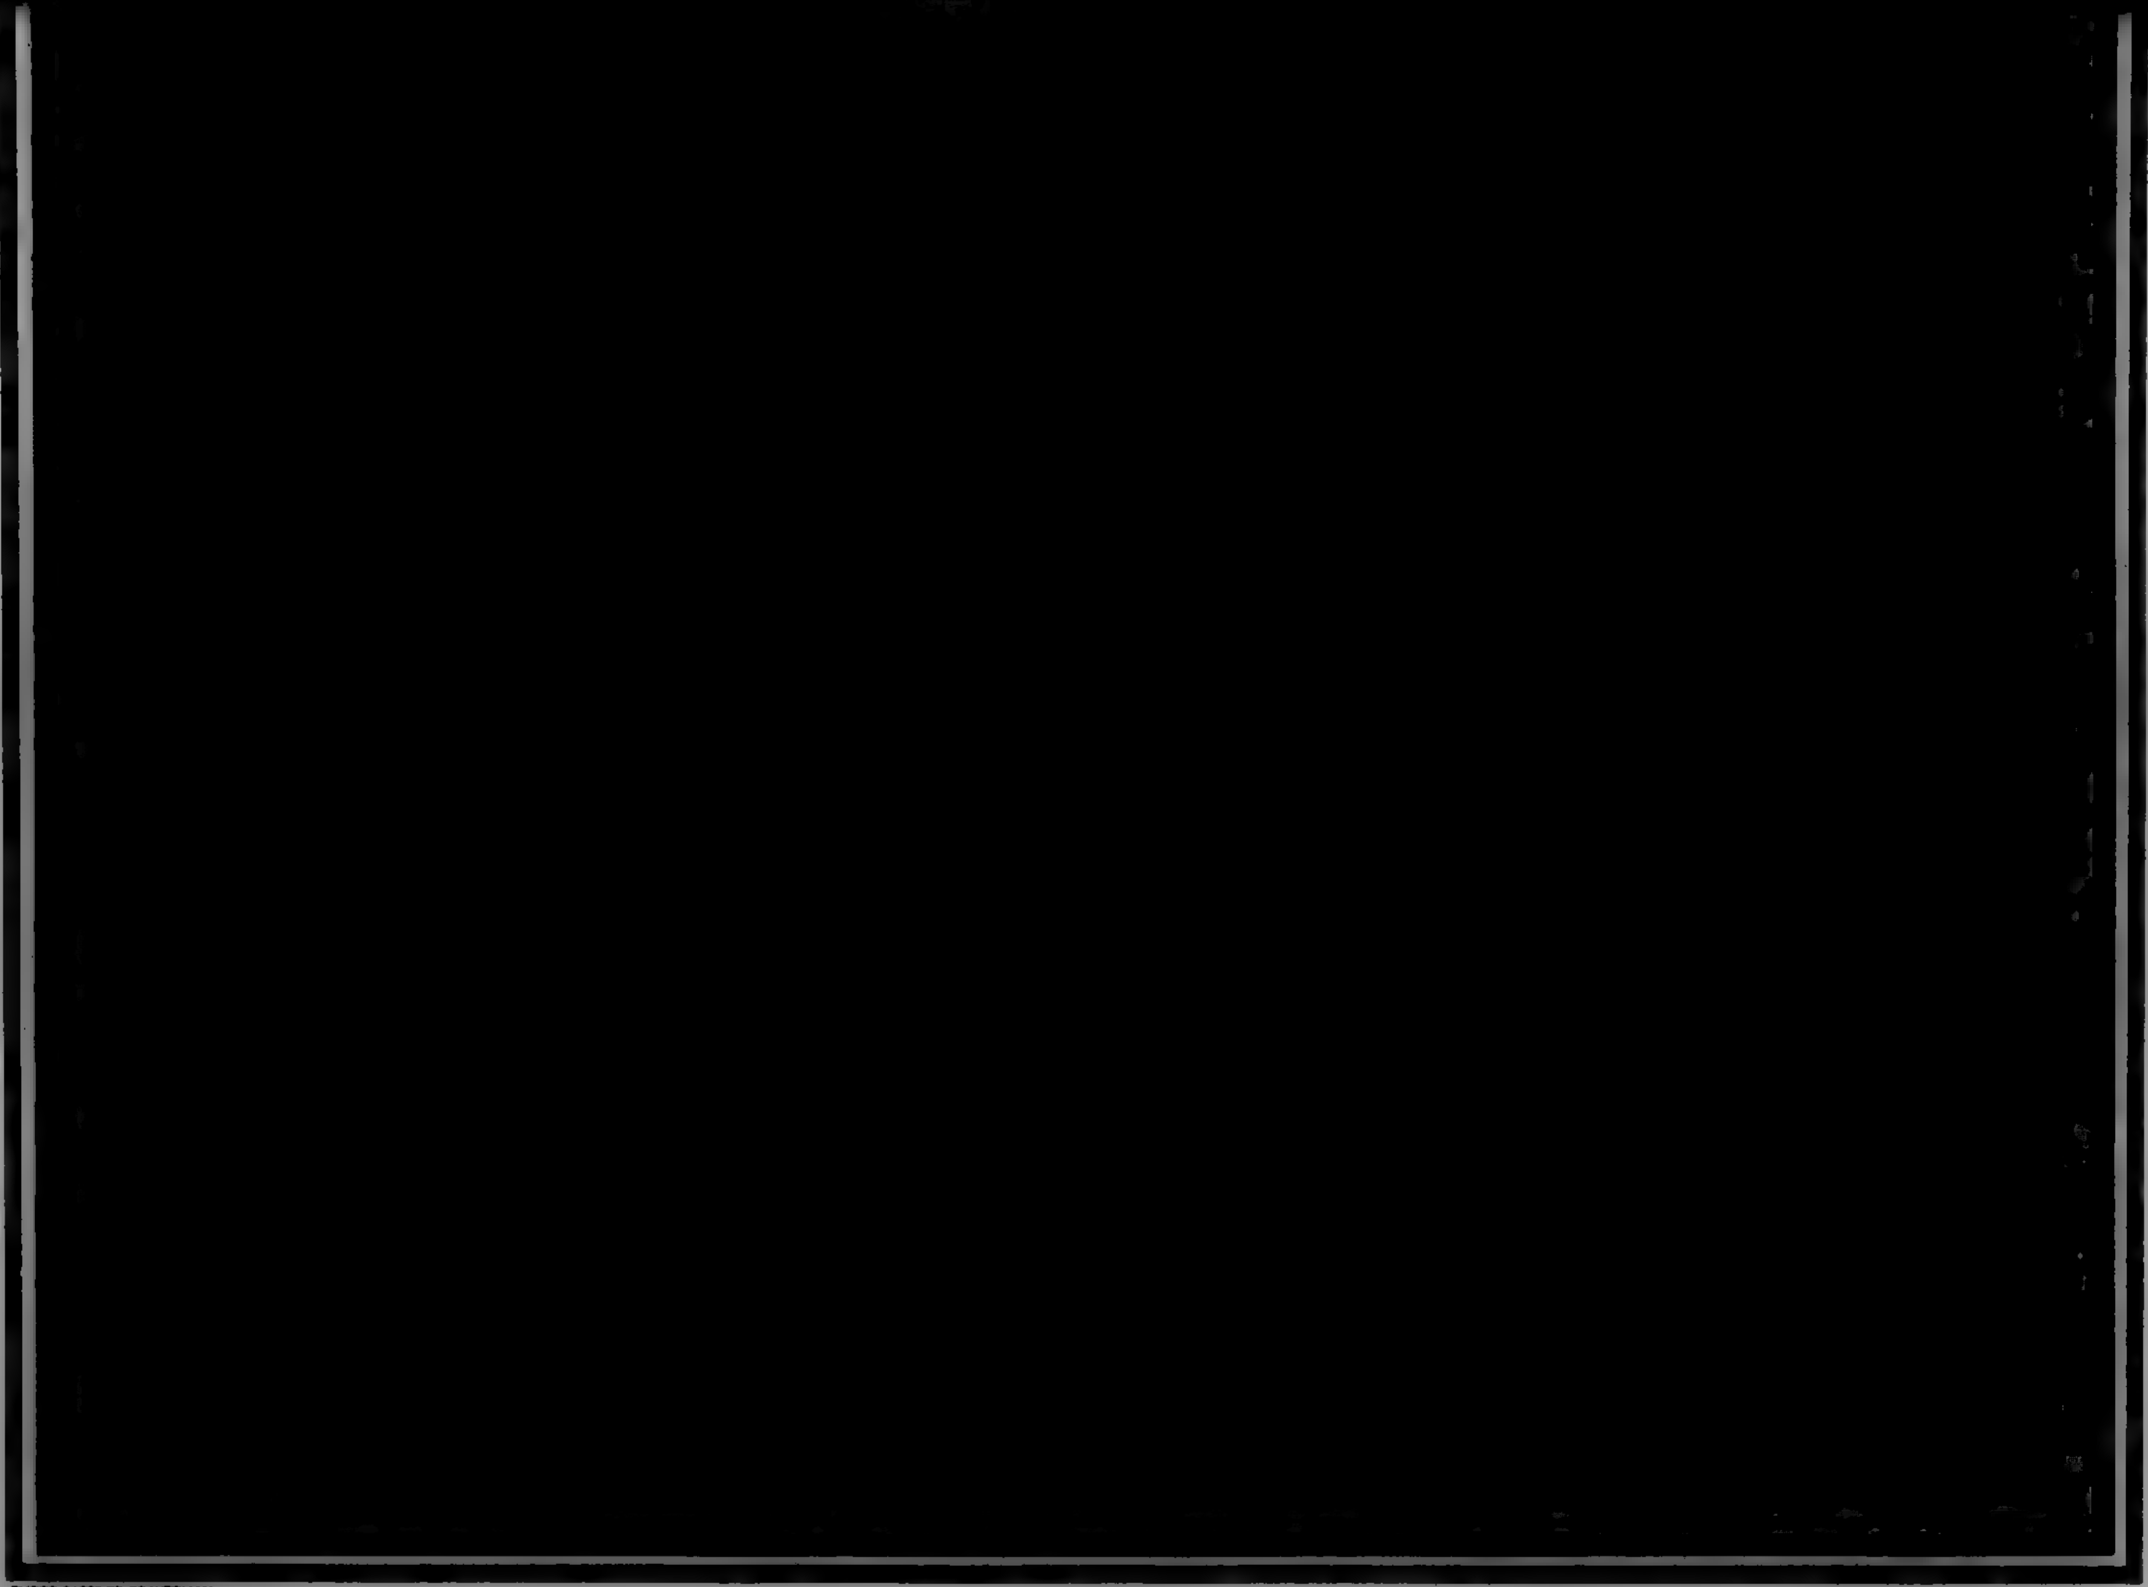

PHOTO ©1986 ED BRAVERMAN

something called Ethernet, which was getting a very good press. The IBM problem was felt to be one of reacting to this Ethernet threat with a product that would incorporate local-area network technology while preserving the basic IBM host-based hierarchy. A solution of sorts was found in a token-passing ring that had been developed at the company's research and development laboratory in Zurich. In its original form, the token ring was an extension of the 8100 Series loop architecture and had the advantage of being SNA-based and hierarchical.

Then the trouble started. IBM had a bad time with its development partners. Mitel, Inc. failed to deliver on high-end digital private branch exchange (PBX) technology; Texas Instruments, Inc. failed to deliver on very large-scale integration (VLSI) interfaces; and later problems developed with Rolm, Mitel's replacement. After publishing a barrage of papers and descriptions of the token ring — which naturally created the impression that it was imminent — IBM announced in April 1984 that, although the token ring was still two to three years away, users could have the wires now. Timing problems hindered attempts by IBM to tie the token ring system into SNA networking, and the five-chip set for the local-area network interface is still too expensive to compete effectively.

For several years, the token ring project was the joke of IBM. Then Big Blue staged a notable recovery. It wasn't so much that technical problems had been resolved, because they hadn't — they still haven't. Rather, IBM corporate management did some hard thinking in 1984 and decided that, whatever its faults, the token ring was a useful part of the SNA scenario. It would significantly contribute to SNA usage and, as any end user will tell you, SNA usage contributes significantly to IBM revenue streams.

Enter the PC Network, sometime in 1982. The PC Network was codeveloped with Sytek, the Mountain View, Calif.-based broadband local-area network vendor. PC Network was a project of IBM's Entry Systems. In those days, Entry Systems was regarded as a high-flying entrepreneurial outfit, and IBM corporate management was inclined to let it go its own way. Entry Systems had great ambitions for the PC Network. Not only would it let IBM move in on the market for PC local-area nets — an area where vendors like Corvus and Nestar were making the running — but the capacity and modularity of broadband coax would provide a new and more efficient method for large end users to hook PCs to hosts. PCs would be used as file servers, gateways and network management systems. At least that was the plan.

As the system neared completion, the fur started to fly inside IBM. IBM's Communication Products Division (CPD) objected to having the PC Network compete with the token ring. During 1984 Entry Systems' popularity inside IBM began to slide, and IBM corporate management put the brakes on. The result was a compromise: PC Network would be introduced only as a 72-device system and would be pitched by IBM only as a PC local-area network. This was scarcely an efficient utilization of the PC Network technology, which could easily support upwards of 200 devices (at least one PC Network in Boca Raton, Fla., happily supports more than 220 devices). The token ring was, however, moving back into popularity. By year-end 1984, it had reestablished itself as the focus of IBM local net strategy. Delays in delivering the PC Network interface boards got the system off to a bad start early in 1985. Then IBM hindered it further by saddling it with the elderly Series/1 as a file server and began to pitch combinations of the S/36 minicomputer and PCs as, effectively, an alternative for departmental automation and future components of the token ring scenario. A sad fate for what could have been an interesting product.

In 1984, IBM decided the token ring was a useful part of the SNA scenario. It would significantly contribute to SNA usage and SNA usage contributes significantly to IBM revenue streams.

Cluster Kit, introduced in February 1984 as a low-end 256K bit/sec CSMA/CD star for PC clusters, was also from Entry Systems and seems to have been aimed at organizations like small businesses, corporate departments and high schools. Cluster Kit never enjoyed much of a commitment from IBM and, when it became clear the PC Network was going to be positioned as a low-end product (supporting up to 72 devices compared with Cluster Kit's 64), the system was quietly "forgotten to death" by IBM.

The Industrial Network turned up as an official IBM product in August 1984. It grew out of IBM's involvement with General Motors Corp.'s Manufacturing Automation Protocol (MAP) program and is essentially identical with the MAP standard. It was adopted by the IBM Industrial Systems group, later re-formed as Manufacturing Systems Products out of Boca Raton, Fla. The group inside IBM successfully argued that there was no way they could offer the other IBM

More Answers from CXI.

PCOX is all you need to turn your IRMA board into a 3270 PC.

Its full name is the PCOX™/3270 PC Upgrade (that's pronounced "peacocks").

But you'll pronounce it "terrific."

First of all, it's available today. Not next week, not next month. Now.

Second, it costs just $395. And since it upgrades the IRMA™ board you already have, you can protect your investment. And still get the IBM™ 3270 PC capability you really want.

Third, you can be sure this software's reliable because we've been shipping it for more than a year in our own PCOX/3270 PC.

Finally, like all PCOX products, the PCOX/3270 PC Upgrade is backed by our proven track record in micro-to-mainframe connectivity. Which you'll be hearing more about in this series.

But back to the PCOX/3270 PC Upgrade. For immediate delivery call (800) 225-PCOX. In California, (415) 424-0700. Or write CXI, Inc., 3606 West Bayshore Road, Palo Alto, CA 94303, Telex: 821945.

And turn the IRMA board you have into the 3270 PC you want.

CXI

We don't have all the answers, just more of them.

PCOX is a trademark of CXI, Inc. IRMA is a trademark of Digital Communications Associates, Inc. IBM is a registered trademark of International Business Machines Corp. ©1985 CXI, Inc.

local-area networks for factory use and they should join the MAP bandwagon.

As early as 1982, Ethernet support seems to have been targeted by IBM as a requirement, and Santa Clara, Calif.-based Ungermann-Bass has been developing an Ethernet gateway for IBM to the token ring. But IBM is more than a little reluctant to be seen backing Ethernet. Such backing could cause people to install Ethernets rather than token rings, and IBM will doubtless wait until the token ring is up and running before so much as breathing the word Ethernet.

The 3270 PC Communications System was mentioned by IBM in August 1984, at the time PC Network was launched. The system was vaguely described as one that allows peer-to-peer communications, file-sharing and peripheral-sharing by 3270 PCs. This doesn't seem to exist, at least not in the form pitched by IBM. In practice, it looks like a 3274-based solution supported as a local token ring configuration or over point-to-point 3270 coax and handling a variety of devices under 3270 protocols. The new IBM high-end 3274 model clearly goes with it. IBM's description of this system as supporting primarily 3270 PCs seems to be an attempt to prevent users from thinking that because it wasn't supported on PC Network, IBM wasn't backing it. IBM is backing it — not selling many, perhaps, but certainly backing it.

The various third-party products sold by IBM (the Corvus Omninet and Orchid PC-Net as cologo products, or the Nestar Plan under a cooperative marketing agreement) seem to have been adopted primarily as stopgaps until appropriate IBM solutions became available.

All these maneuvers can be seen in one of two ways: either IBM has made a clever move to sell multiple solutions for different applications and thereby bracket the market (that's the way IBM tells it) or IBM is making an improvised attempt to pull a bunch of disparate and incompatible products together into some semblance of a scenario (which is what has actually happened).

Some major problems arise for end users thinking of going the IBM local-area net route or at least waiting to see what IBM's local-net scenario looks like before making commitments. Not the least is that any kind of coherent IBM scenario is still several years out. The much publicized token ring looks as though it will make an initial appearance this year, but in a partial form and with limited availability. The interface cost is still high, and IBM is likely to stall full token ring availability until it can lower the cost of the token ring VLSI chip set to a more attractive level. This means a probable wait of at least another year before the token ring begins to resemble a final product.

PC Network's status also contributes to the confusion. The product has undergone at least a change in positioning, with the Series/1 now being pushed as a file server. PC Network was also recently transferred from its home at Entry Systems to a new unit IBM set up at Raleigh, N.C., to handle product strategy for all IBM local-net systems. There will probably be further changes, notably in integrating PC Network into the token ring environment. With the token ring taking priority, PC Network will likely remain crippled at the 72-device level. Sytek makes larger configurations of the system available but doesn't push them very strongly, and IBM isn't talking much about them. In addition, IBM seems to be planning to support Ethernet, but isn't talking about it.

All this activity suggests a certain caution for those who are looking at IBM local-area network solutions. The token ring and 3274-based solutions fit primarily into the SNA 3270 world; indeed, IBM has described the token ring as being primarily a subset of SNA implemented at the Data Link level. It may appeal to those with heavy SNA 3270 investments, perhaps, but scarcely qualifies as a general-purpose local-area network, and end users who aren't already deep into SNA may find it not worth waiting for.

PC Network could be a good product, but it's not clear IBM will allow it to be one. PC Network could be crippled further to protect the token ring. It would be a good candidate for attaching PCs and other devices in Ascii environments, but IBM is edging it into the SNA world.

Of the other IBM products, Industrial Network is merely an IBM implementation of MAP and more credible vendors with greater factory experience exist for this type of solution. Cluster Kit is dead in the water and certainly not guaranteed a future. The various third-party PC local nets marketed by IBM could be dropped at any time by the IBM direct sales forces. And, finally, for Ethernet support, there are also better candidates than IBM.

The bottom line seems to be that if you're waiting for IBM, don't. IBM's local net portfolio consists of a bunch of disparate and incompatible products, which the company has only recently gotten around to sorting out. Its key strategic product, the token ring, is a specialized system designed for SNA environments and 3270 device bases; and IBM shows no signs of bringing in the kind of general-purpose, modular, multivendor local net most of the market wants.

As an alternative, you could wait for IBM to present its definitive scenario, but you may wait a long time and you may not like it when it finally arrives. ‡

■

Jeffery is director of research for International Technology Corp. in Palo Alto, Calif.

FOX

FOX RESEARCH, INC.

Affordable PC Networking That Does It All?

Chadds Ford, PA — Carrier Systems Motor Freight Company, Inc., headquartered in Chadds Ford, PA with operations in key midwestern cities, recently acquired the Fox Research 10-NET™ LAN to handle HQ freight data. The Fox 10-NET™ is a unique networking system that permits an unlimited number of compatible PC users simultaneous access to all data files within the system.

Martin Reber, Carrier's National Marketing Manager-Information Systems, in reference to 10-NET™ capabilities: "The people at Fox Research must have sat down with a real end-user and listened to what they needed before going to the drawing board to design the network."

The 10-NET™ LAN, being used at Carrier Systems' Chadds Ford headquarters, ties together two dozen various PCs and two printers that serve the entire network. "The spooling feature, itself, minimized the necessity of having to buy a hard disk drive and printer for each workstation," stated Mr. Reber. "The Fox Research 10-NET™ is not only extremely cost-efficient in that manner, but also it is extremely flexible. The network gives us the capability to continue operating even though several machines are down."

Reber related that the key to the entire Carrier Systems' operation, which includes the addition of the Fox Research 10-NET™ LAN to its ten other motor freight terminals, is its "ease of installation and portability. We were able to add PCs to the network, and gain access to the superstation at the rate of one PC per 15 minutes. We've increased productivity because the Fox Research 10-NET™ LAN gives any number of our users simultaneous access to all our data files."

After installation of the 10-NET™ LAN, in its Chadds Ford headquarters, Carrier Systems proceeded to equip its operation with Fox's 10-NET™ SNA Gateway which then linked them to their Salt Lake City mainframe. "We eliminated an eight-port IBM 3274, six terminals and estimated a cost savings of approximately $1000 per week in the telecommunications area," stated Reber.

The 10-NET™ Investment

10-NET™ - for IBM®PC, XT, AT, also for compatible systems under DOS 2.0 and greater. Addressing and message format compatible with ETHERNET® standards, yet uses economical twisted-pair wiring. Also includes: print spooling, multiple security levels, interstation communication, electronic mail, concurrency control, bulletin board calendar scheduling, CHAT and CB.
Suggested U.S. price — $695.

10-NET™ SNA
Gateway - The economical micro-to-mainframe link that permits network PCs to emulate terminal functions in mainframe applications.
Suggested U.S. price — $1,800

OTHER ACCESSORIES
10-NET™ REPEATER
10-NET™ BOOT ROM
10-NET™ RM COBOL RUNTIME
10-BASE™ MULTI USER DBMS

RON CHIRONNA

Has AT&T Got a Deal For *You*...

Always in the forefront of technology, AT&T is now pushing integrated systems digital networks. When will ISDN become a reality, and what will they mean to your operation?

By H. Paris Burstyn

Since divestiture, the new AT&T has taken its lumps in unregulated markets. Current word has it that the new AT&T is a technological also-ran and that its computer technology and line of computers are too late into the field to make any difference. This philosophy discounts two important facts: AT&T invented the transistor that started the computer revolution, and its 3B line of computers forms an integral part of the world's most sophisticated and most reliable telecommunications network. What AT&T really lacks is not technology, but the ability to sell these systems into a commercial environment.

AT&T's true strength lies in its communications orientation and its increasing ability to interconnect devices from a wide variety of vendors. Although many businesses consider the ability to interconnect different computers a high priority, few are actually in a position to use that facility. In some cases, therefore, an AT&T weakness may stem from its technology's having outstripped its customers' needs.

This technology/application imbalance may also account for the softness in the personal computer market: Personal computer users are not using today's machines to their fullest potential; they are waiting to buy new ones, thereby accounting for the market slowdown.

As customer needs and new markets grow, other companies will develop comparable technology to challenge AT&T, but it is more than likely AT&T will set the pace for intervendor communications. By stressing communications over computers, AT&T's computer product line may never become a core business — a strategy that plays to AT&T's traditional strength. But when one of its communications network customers needs to expand computing facilities, AT&T will be able to supply new hardware compatible with the customer's installed machines. Even if AT&T does not acquire or form a joint venture with a computer manufacturer, as has recently been speculated, the company's current line is serviceable enough to fulfill the role of secondary supplier.

Although some AT&T products may be solutions looking for problems, competitors quickly respond to any move AT&T makes and rush to emulate communications products. In communications technology, AT&T leads the pack.

Nevertheless, AT&T has had some major setbacks. Net 1000 has yet to make a substantial contribution to company revenues — despite innumerable evolutionary steps and name changes. The company is also conspicuously absent from the public electronic mail business. AT&T's slow starts in these arenas make sense, however, when put in market perspective.

Net 1000, a sophisticated time-sharing network, made its debut just as the entire remote computing services market began to slip in the face of competition from distributed data processing. Competitive ventures, although more successful than Net 1000, have not turned in stellar performances. For example, IBM's Information Network accounts for only a small percentage of the DP giant's sales, and General Electric Information Services Co., the market's leader, recently laid off more than 400 employees.

Industry rumors abound regarding AT&T's pending entry into the electronic mail market. The company's caution is well considered because AT&T would have to bring some special characteristics to any system it introduced to the market. It must set itself apart from MCI Communications Corp.'s Mail and Western Union, Inc.'s Easylink if it is to avoid the also-ran label.

If it does bring a sophisticated electronic mail service to the market, AT&T runs the risk of bringing a too-sophisticated product to a market where even simple systems have yet to earn any substantive profits.

If AT&T were to enter the public electronic mail market, it would have to deliver a traditional electronic mail service (such as GTE Telenet Communication Corp.'s Telemail or ITT's Dialcom) combined with hard-copy capabilities of MCI Mail and Western Union's Easylink. That service alone, however, would not be enough; it would have to add an applications level — adding value to, and setting itself apart from, basic services readily available from other providers.

A likely strategy could see AT&T linking electronic mail service to a Net 1000-like computing service. This tactic would provide users with automated access to data base management and DP functions. Early this year, AT&T announced plans to deliver central office equipment necessary to support the first commercial integrated services digital network (ISDN) to Ameritech (the regional holding company that provides local telephone service to Illinois and neighboring states) for service trials in the fourth quarter 1986. Shortly after that announcement, virtually every major vendor of central office switches from around the world hustled to announce comparable equipment and to line up test sites for their equipment. Similarly, when AT&T announced Software Defined Network Service, other long-distance carriers — known as other common carriers — quickly announced comparable services.

Software defined networks (SDN), or virtual private networks, provide a stepping stone on the road to ISDN. SDN take advantage of the constantly increasing capacity of the public switched telephone network and the intelligence of new digital switches to provide private network availability without the cost of leasing private lines. Instead of leasing private lines, customers that now make heavy use of private-line and Wats services can take advantage of software that resides in network switches to program the public network to meet specific point-to-point and point-to-multipoint communications requirements.

Virtual private networks allow customers with heavy communications needs to create their own networks. Each customer's network routing functions will be contained in network switches where specialized hardware and software will allow customers to call other virtual private network locations, off-network locations on that carrier's switched network and interconnected private networks.

In such virtual private networks, transmission facilities are dynamically allocated on an as-needed basis, instead of being physically dedicated to a particular customer on a full-time basis. AT&T Communications, United Telecom Computer Group, MCI, Satellite Business Systems and Western Union have announced intentions to provide such service.

How To Triple The Speed Of Your 3270 Printer

Another Smart Solution From AVATAR

It's a sad sight. Seeing your IBM 3270 printer falling further behind every day. Outpaced by ASCII printers that deliver far greater performance at a much lower cost. ASCII printers that, until now, didn't link to your 3270 system.

Enter AVATAR's PA1500 protocol converter. It lets you attach virtually any ASCII printer directly to your 3270 network with a simple coax connection – including printers that are three times as fast as your IBM printer and cost half as much.

Now you can select the printer that matches your system needs. For greater speed, letter quality printing, better performance. Fast dot matrix or line printers. Bar code or graphics printers. Even the newest ink jet or laser printers can be a part of your 3270 network.

Together, the PA1500 and the printer of your choice give you all the capabilities of your IBM printer...and more.

So get yourself an AVATAR PA1500. And bring your 3270 printer up to speed.

CONTROL.

EMCOM

When AT&T filed with the Federal Communications Commission to begin service by July, the other common carriers and some regional operating companies petitioned the FCC to reject or suspend the proposed AT&T tariff. Early in June, the FCC suspended the AT&T Communications tariff; this action will delay the company's beta test for as long as five months — the length of time allowed by FCC statute. In effect, the delay allows AT&T's competitors to get their products ready for market.

To provide virtual private network services, carriers use two different approaches. For the most part, the other common carriers take advantage of their switches' functions to create an independent dialing plan for each customer. That dialing plan is distributed throughout the network at each switch that will be involved in the customer's software-defined network.

To do this, memory in each switch is partitioned to accommodate a separate dialing plan for each company. The company identity is carried from switch to switch to maintain the individual dialing plan. When configurational changes are required (by company reorganizations, consolidations and so on), network changes are implemented by modifying routing information at each switch.

AT&T employs a different architecture that leverages the common channel signaling capability of its long-distance network. AT&T will maintain its customers' specialized dialing plans in a centralized data base rather than distribute them throughout the network. AT&T's common channel signaling technology is not available to other common carriers, so when customers require a configurational change, they must do it at every switch. Common channel signaling allows AT&T to make one change at the central data base.

AT&T's relatively advanced technology will allow it to provide virtual private networking more efficiently than its competition can, but it won't prohibit other common carriers from delivering similar service. Other common carriers will test and commercially offer their software-defined networks before or at the same time AT&T will. Nevertheless, AT&T was the first to announce it, and then competitors jumped on the bandwagon.

Software-defined networks will allow users to combine a range of communications services into a single, integrated service, which will give them greater on-site control of their network. In this way, SDN resemble ISDN; AT&T notes it has designed SDN as a precursor to ISDN.

Against this background, the availability of virtual private networks (from all carriers) will put pressure on local telephone operating companies to offer virtual local connections to match the long-distance virtual network. Such links would allow customers to have dedicated access to virtual networks without having physical facilities devoted to their exclusive use. Local service offerings are a key part of AT&T's strategy to sell the No. 5 Electronic Switching System (5ESS) central office switch to local operating companies.

AT&T's 5ESS is the cornerstone of its ISDN and Universal Information Service strategy. Although ITT's System 12 is considered a more advanced central office switch, ITT has had trouble manufacturing System 12 and is behind in its shipment schedule around the world. In addition, System 12 is not compatible with the telecommunications network in the U.S. and ITT is currently working to adapt it to domestic standards. This leaves AT&T's 5ESS and Northern Telecom, Inc.'s DMS line of digital switches as the main competitors in the U.S. central office market.

According to AT&T, 5ESS is designed to incorporate most ISDN features in one primary processing unit. Northern Telecom's DMS requires peripheral devices to provide similar ISDN capabilities. Northern Telecom announced ISDN for the DMS about two weeks after AT&T announced functions for 5ESS. AT&T's technology offers network planners an advantage in facilities they will need. They won't have to plan for additional room to house extra equipment, and the AT&T switch could be more reliable because it requires fewer cabling connections to other equipment.

AT&T's technology offers network planners an advantage in facilities they will need. They won't have to plan for additional room to house extra equipment, and the AT&T switch could be more reliable because it requires fewer cabling connections to other equipment.

Two Reliable Systems

Nothing is more reliable than the predictable path of the solar system.

And nothing is more reliable than your LAN system using these GENERAL INSTRUMENT components.

X-2000 LAN Amplifier—the only mainstation that offers fully redundant two-way communication, as well as plug-in status monitoring in one amplifier. Redundant power packs assure continuous operation.

Status Monitoring System—continually tests every active LAN component from the headend. It provides instant reports on how the system is functioning and offers the capability to make changes in the system remotely.

Transverter Redundancy Switch—continuously tests the primary and back-up transverters. It instantly switches to the back-up, when needed, allowing continued data flow at all times.

Standby Power—the SPS-RS redundancy switch offers automatic switchover to a back-up system power supply. Or…the STPS standby power supply offers integral battery back-up.

Whether upgrading or developing a new LAN system, trust these General Instrument products to maximize your system's reliability.

For complete information on our expanding line of modem, distribution, and headend products for broadband local area networks, ask for our new LAN catalog.

The general concept of ISDN has it functioning as easily and as invisibly as today's telephone network system. It will allow people and their computers to talk to any other person or computer over a network that can store, transport and deliver any combination of voices and data at any time from any place.

ISDN are the stuff of every equipment and service suppliers' dreams. ISDN will bring these companies new sources of revenue as they provide customers with a wide range of new services.

Today, interconnecting all those people and systems is a technical nightmare; as a result, many people involved with the U.S. telecommunications industry believe ISDN will remain a dream — at least into the next century. But for the U.S. market, AT&T seems to have the technological advantage over the other central office switch manufacturers.

While a few of the major central office switch manufacturers have sold auxiliary equipment (such as trailer-mounted portable switches and signal transfer point equipment) that will perform some ISDN functions for operating telephone companies, AT&T and Northern Telecom will probably take even shares of 90% of the 1985 market (with GTE capturing the remainder by selling to its own operating companies).

In 1986, AT&T can be expected to increase its share of that market to 70%, which it held prior to 1984. (In 1984, Northern Telecom won the majority of contracts because its digital switch was ready and AT&T's was not.)

In 1986, Ameritech plans to test the nation's first ISDN in Chicago. Initial ISDN service will provide simultaneous voice and data transmission capabilities over the same wire.

Today customers can send both voice and data over the same telephone line, but they can't send both signals at the same time. If customers want to send large amounts of data at high speeds, they must order lines that have been specially conditioned to handle the data. ISDN allows simultaneous transmission and obviates the need for conditioning arrangements.

As its technology evolves, AT&T sees the advent of Universal Information Services, which it likens to its earlier goal of universal telephone service. Universal Information Services will allow telephone companies to give customers the ability to custom configure their telephone system and data communications network without buying specialized equipment; they will use the intelligence that resides in the telephone company's central office. Just as it uses 5ESS for ISDN products, AT&T plans to use 5ESS as the core for the broad range of products composing Universal Information Services.

Universal Information Services will give users the ability to call up the services they need when they need them and to pay for them as they use them. Although ISDN integrates voice and data storage and transmission services, Universal Information Services gives customers the ability to change the network's configuration at will as well as handle image transmission (teleconferencing).

Only a fraction of ISDN-type services are available today, and they require making special arrangements with value-added carriers — companies that allow customers' computers to talk to other computers regardless of the computer manufacturer; some also provide access to public data bases, remote computer services and electronic mail. Value-added carriers lease lines for long-distance and local telephone companies (some build their own communications networks), add computerized functions to them and then resell them to their customers.

This data transmission facility, available over so called value-added — or overlay — networks, is only one piece of ISDN, and it isn't integrated with voice or image transmission services. Lumping all these features into one integrated network will make it very easy for users to perform any communications applications they want.

Demand for integrated services already exists. Many large companies subscribe to overlay networks such as Telenet and Tymnet. But customers subscribing to these services must pay monthly membership fees as well as minimum usage and per-use charges.

AT&T sells 5ESS to telephone operating companies and claims its hardware and software technology make the switch attractive to these potential customers. The attraction is that local telephone companies will be able to increase the number of functions a 5ESS delivers by implementing new software, not installing new hardware.

To a local telephone company, new services mean more revenues. These services, available through software, are inexpensive to acquire, but very attractive to users.

Pricing services to entice users to apply them will increase network usage levels. Because new services can be installed incrementally and at relatively low cost, ISDN technology translates into improved margins for the telephone company and improved service for customers.

AT&T will drive competitors to keep pace and further enhance services and margins; its technology development will drive the evolution of new applications to take advantage of these services.

How To Delight Your Lotus With Mainframe Data

Another Smart Solution From AVATAR

The idea is simple. Make your PC spreadsheet even more powerful by giving it mainframe data. But getting that data out of your mainframe, into your PC and onto your spreadsheet isn't that simple.

Until now, you've had three choices. Transfer entire files from the host and risk choking your PC with data. Not very efficient. Or find the information in printed reports, then reenter and reformat it. Very tedious. And the alternative of asking your DP department to write special host software…well, they're overburdened already. Three choices, no real solution.

Now there's TURBO, the newest micro-to-mainframe link from AVATAR.

TURBO's Data Capture lets you select just the information you need from the mainframe. And use it immediately in any of your PC applications – Lotus, dBASE, you name it. Without rekeying, reformatting, re-anything.

And you can use TURBO's host-assisted File Transfer the way file transfer was meant to be used – for sharing data with other PC users on the 3270 network.

If that isn't enough, TURBO's exclusive Macro Language adds a whole new dimension to your micro-to-mainframe link. Use Macros to automate file transfer and data capture. Better yet, massage host data even before feeding it to your spreadsheet.

So give your PC a TURBO from AVATAR. And delight your Lotus with mainframe data.

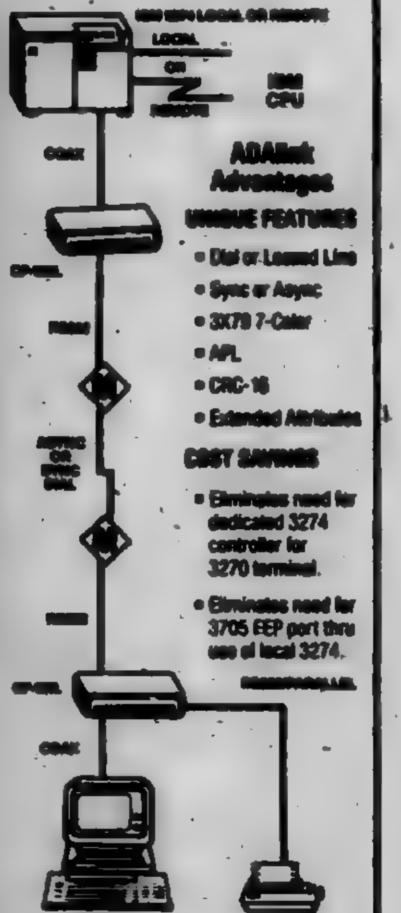
NOW YOUR 3270 TERMINAL CAN TALK OVER THE PHONE

INTRODUCING ADAlink™

Adacom Corp's new CP-100L and CP-101L allow 3X78/79 coax terminals to attach remotely to 3274/6 controllers via inexpensive asynchronous dial modems or synchronous leased line connections.



ADAlink Advantages

UNIQUE FEATURES

- Dial or Leased Line
- Sync or Async
- 3X79 7-Color
- APL
- CRC-16
- Extended Attributes

COST SAVINGS

- Eliminates need for dedicated 3274 controller for 3270 terminal.
- Eliminates need for 3705 EEP port thru use of local 3274.

To learn more about ADAlink and its unique capabilities, call or write:

Adacom Corp.
905 N. Mur-Len Rd. • Olathe, KS 66062

Token-Passing Ring Networks

Local-area networks don't just happen; the good ones are the result of a lot of careful planning. Before you commit your company to a local net, take a look at token-passing technology — it may be worth the effort.

By Edwin G. Brohm

Local-area networks have developed in response to problems that have cropped up in the area of data communications. Like computers, these nets have different characteristics, specifications and applications. Unlike computers, however, their selection often fails to receive the hours of careful attention data processing managers devote to finding the best choice for their applications.

One choice for a local-area network is the token-passing star-shaped ring, which is one of the most reliable, fault-tolerant and easily maintained local nets available. Token-passing star-shaped ring nets solve several problems encountered with other types of networks, including those employing carrier-sense multiple access with collision detection (CSMA/CD) such as Ethernet and token-passing bus architecture. To determine a network's superiority, a potential buyer should pay careful attention to four key networking attributes: reliability, ease of maintenance, ease of expansion and network performance.

Reliability: Reliability is a major cost factor in selecting a local-area network; a network that lasts longer without breakdown will obviously cost less to own than one that fails weekly.

To be reliable, a network must be distributed. Pure star-shaped networks that employ a central processing node are susceptible to total network downtime from this single point of failure. In a star-shaped ring, wire centers, which connect nodes to the ring, allow the ring to be distributed. If any point in the network fails, other nodes on the local-area network will not be affected. In addition, in the event of a cable break, the ring automatically partitions into smaller subrings that continue to function.

Networks based on token-passing bus architecture that employ CATV components must be swept periodically and tuned if they are to function properly. In contrast, the passive wiring system used by token rings is based upon the wire center and contains no power supply or logic.

The only active components of the token ring are relays, which are specified for millions of operations. As an example of reliability, the mean time between failures of a wire center is measured in years. The token ring employs a more distributed topology and will last longer without failure, increasing reliability.

Maintenance: If a failure does occur on a network, a quick and easy method of locating the problem should exist. A good deal of network downtime is often spent trying to find where the fault occurred. A properly designed token ring network will minimize the time needed to make repairs.

Token rings have a maintenance advantage over bus networks because token rings can be self-diagnosing. For example, an LED indicator positioned on the passive wire center can indicate which station is malfunctioning. If the LED is designed into a central panel, locating breaks in a system will be even easier. Repairs or replacement of a faulty node can be made immediately. And, because the token ring local net bypasses the failed node, the network continues to operate during repairs.

Another method that incorporates self-diagnostics allows the token ring network to indicate the node or point between nodes where the problem is occurring. A network monitor could interrogate the host controllers containing the error and allow the operator to locate the failure quickly and to repair the network.

Expansion: In a token ring network, new computing devices can simply be connected to a wire center. In comparison, if new computers or workstations are added to a CATV-based network, the system will eventually have to be realigned, and modems and amplifiers may have to be adjusted to compensate for network growth.

Token ring local-area networks generally operate using a single frequency and therefore do not require rebalancing. Stations can be added to a network without frequency adjustments. In addition, token rings do not contain amplifiers or splitters.

The cable in a bus network will have to be physically tapped to add nodes if a network is expanded. This process, boring small holes into the cable, cleaning with tweezers and clamping with a tap may be cumbersome. In a star-shaped ring, users simply plug nodes into a wire center and the process is more conducive to prewiring.

The token ring also offers another advantage, flexibility in network media. In a factory, for example, inexpensive shielded twisted-pair wiring may be sufficient for most areas; in an electrically noisy area, fiber-optic cable may be used as part of the same network.

Performance: Although many networks claim high signal rates, the best measure of a network's performance is its data throughput. A CSMA/CD throughput may actually be much lower than its optimum data rate for two reasons. First, transmission can be slowed or halted when two or more stations send data at the same time; second, there is often a large amount of overhead per data packet, such as message preambles and host addresses.

The collision problems of CSMA/CD local-area networks are not shared by token ring nets, and their overhead per packet is low. In addition, token passing local-area networks allow orderly transmission between stations. As the token is sent along the network, each station has the option of sending data or passing the token on to the next station, which means that each station has equal and predictable access to the network. No opportunity for collisions or garbled transmissions exists. CSMA/CD networks have a potential for delayed or aborted transmissions when multiple users contend for access to the network.

An increasing number of vendors and users are looking toward token ring local-area networks as the new standard. IBM, both in its Statements of Direction and in an extensive advertising campaign, has announced its support for token ring local-area networks and is promoting its new cabling system, which will support token ring networks. According to IBM, token ring networks are reliable and offer greater predictability of performance and greater network management capability.

As data bases grow and become accessible by multiple departments, accuracy and speed become major factors in data transmission. Token ring local-area networks can offer more speed and accuracy than CSMA/CD-type networks. In addition, token rings have proven to be more reliable, easily maintained and expandable for future growth.

In the final analysis, the user must choose a local-area network according to specific applications. Selecting data communications equipment is just as important as finding the correct computers. Reliability, maintainability, fault tolerance, flexibility and speed should be some of the criteria for selecting a local-area network.

“...Fiber Optics...”

Fiber-optic cable is no longer just the domain of large telecommunications companies. Fiber optics solves problems ranging from overcrowded conduits to data integrity, and DP managers are now jumping on the “speed-of-light” bandwagon.

By Lee White

The year was 1983 and Terry Rosga, manager of network services for the city of Dallas, had a big problem. The city's tremendous growth and its progressive attitude toward automation were being stifled by yesterday's technology.

Rosga investigated many avenues for solutions, not only to the problems the city was facing in 1983 but to those it might encounter for the rest of the 20th century. He looked at high-speed digital lines, but ruled them out because of the better than 6,000-feet distances. He turned down the possibility of AT&T's Dataphone Digital Service because of the nearly prohibitive expense involved. Microwave communication was tossed out, primarily because security couldn't be assured. And all the alternatives were susceptible to weather glitches. Fiber optics looked like the best choice for Dallas, especially because there would be no month-to-month recurring costs after the fiber was purchased.

Rosga recalled how bad things were in 1983; for example, at that time, police called in information from the beat, and clerical personnel entered it. From that entry point, data would go over one of several leased lines to a central file and be sent to any number of places — from the jail facility at one end of town to the criminal justice court facilities at the other end of town. Response time was critical, but the seconds became minutes. In addition, leased lines were costing the city a great deal of money.

Complicating this problem were others, including printing of the next day's court docket. Although a high-speed printer was used for this task, police department personnel who didn't understand how the printer worked would go into the “supposedly” locked room and push buttons in an attempt to achieve higher speeds.

Before Rosga presented his recommendations to the director of network services and the city manager, he decided he had better make sure fiber optics was the right solution for Dallas. He called in Phalo/O.S.D Corp. and Fibronics International, Inc., for a system test. The Fibronics demonstration was successful. With the groundwork laid by Rosga and his team, his employers not only gave the initial go-ahead, but granted some money for research and development. With this imprimatur, Rosga was able to investigate the best method for installing fiber and found that, because of a 15-year-old franchise statement, the city would be able to install fiber through conduits owned by Southwestern Bell Telephone Co.

The next step was to write exact specifications and go out for bid.

The city received several responses, with Fibronics a low bidder at $155,000 for cable and boxes. "Bell was trying to do it, but didn't have the black box — and it was the time of the split-up. They wanted $1.3 million just for the cable and five years' maintenance on the cable. We would never own it, and Bell would have to get the boxes from somebody else," Rosga said.

Rosga hired Dallas' traffic signal employees to carry out the installation procedure — lay cable, actually pulling it through manholes. It took 17 workers four weekends to accomplish the task, running two different routes for redundancy. Each cable consisted of 12 fibers; each fiber could handle 32 terminals.

The project for the city of Dallas took two years from inception through implementation. Rosga, who is now a systems engineer with General Datacomm Industries, Inc., estimated the installed fiber-optic cable would indeed meet Dallas' needs through the end of the century.

The end of the century seems like a long time indeed in a technological field where longevity is measured in five-year blocks of time and where the management information systems (MIS) director's fondest wish is to install a machine that's not 50% obsolete by the time it's up and running. But spokesmen for the fiber-optics industry talk in terms of cable that will last forever.

J. Morris Weinberg, chairman of Fibronics International, Inc., in Hyannis, Mass., stated that, although fiber optics isn't doing everything today, it will; he added that 99% of the world's networks today are done with coaxial cable. Some people are saying, "Wait a second, slow down. Isn't there a better way of connecting all those assets together than having lots and lots of cables, each of which has limited bandwidth capacity?" Weinberg said that those people are only the tip of the iceberg.

Perhaps one reason more data processing people have not gone the fiber-optics route is the newness of the field. Brian O'Brien Sr. developed image-transmitting bundles of fibers in the 1950s at American Optical Co. in Southbridge, Mass. In 1963, Elias Snitzer, also at American Optical, suggested optical fibers could transmit communications signals. It was not until 1970, however, when Robert D. Maurer, Donald B. Keck and Peter C. Schultz at Corning Glass Works, Inc., were able to produce a fiber that had acceptable attenuation rates of 17 decibels per kilometer. It was another seven years before both the Bell System and General Telephone and Electronics put prototype fiber-optic systems into service carrying live telephone traffic.

Charles DeLuca, vice-president of sales and marketing for the Spectran Corp. in Sturbridge, Mass., characterized the eastern corridor as Silica Valley. That area includes many fiber-optic companies in the Sturbridge/Southbridge, Mass., area; Corning Glass Works in Corning, N.Y.; AT&T Bell Labs in New Jersey; and Sperry Corp. in Pennsylvania.

DeLuca came up with the same phrase Fibronics International's Weinberg used — "tip of the iceberg" — to describe the state of fiber optics as it relates to data technology. He stated that fiber optics' usefulness is limited only by engineers' creativity. "The future is as bright as engineers perceive it can be. The whole technology has risen out of the curiosity stage and into the real world. It's no more wishful thinking. What were perceived notions five years ago have become reality today because the components are here and can move right into production."

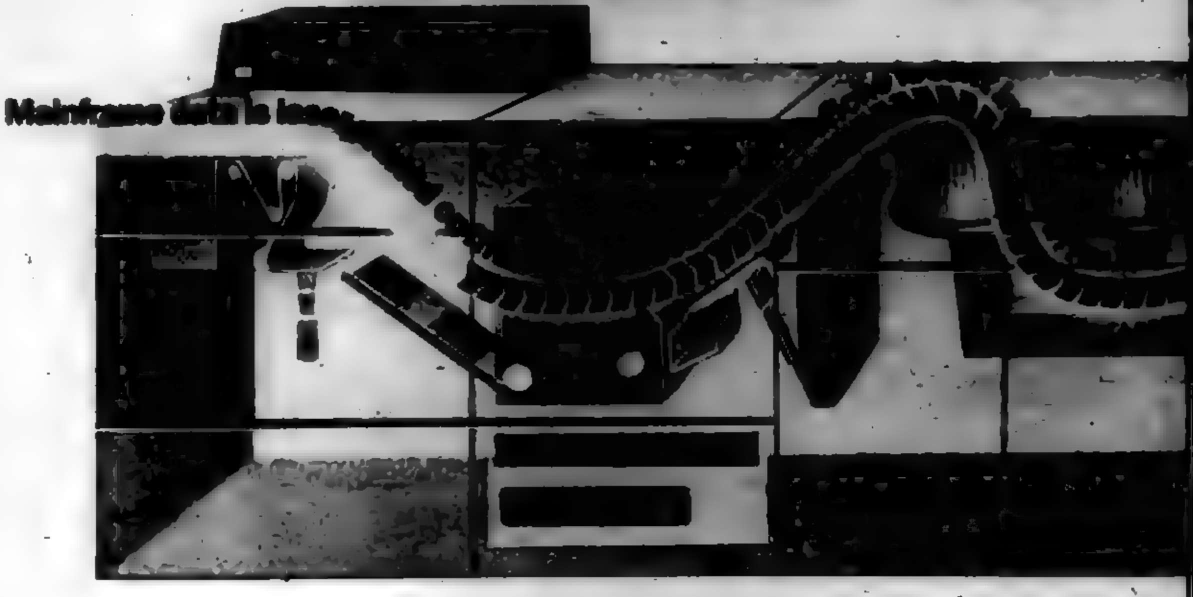
Journeys into outer space put Artel Communications Corp. in Worcester, Mass., into fiber optics in a big way. During the first space shuttle, the National Aeronautics and Space Administration encountered problems with television cables radiating and affecting its tracking systems. According to Dave Monk, Artel's director of marketing, Tadeusz Witkowicz, president of the fledgling company, went to CBS and offered to build fiber cables and fiber-optic modems that didn't radiate and took up far less space than traditional cable. CBS accepted Witkowicz's offer, and Artel Communications was off and running.

Fiber-optic technology has had an impressive albeit slow acceptance. The biggest forward leap in legitimizing the use of fiber optics for data communications, however, was IBM's announcement of its Sierra series, which uses optical fiber to extend controllers, DeLuca said. MIS directors who have been burned in the past by adopting a here-today-gone-tomorrow technology should begin to feel more comfortable. "Now IBM has the lead. When Big Blue has taken the lead, that's it," DeLuca explained, adding, "We haven't seen the beginning of it yet. It's just mind-boggling."

What exactly is fiber-optic cable and how does it differ from the more commonplace coaxial cable or twisted-pair technology? The only real difference is the method by which information is passed through the cable. Over copper wire, digital information is changed to analog signals and back again; over fiber-optic cable, the digital signal is turned into light.

One of the biggest selling points for fiber-optic cable is security. Fiber-optic cable transmissions cannot be compromised or intercepted without actual physical access into the cable. This bug-free characteristic has made fiber optics the cable of choice for military installations.

KODAK INTRODUCES THE COM
AUTOMATIC
START TO



It's the COM you asked for: A completely integrated system, automated and in-line.
Now your mainframe output can be printed by laser on film, processed, duplicated, and intelligently collated—yet nobody has to lift a finger.

No clock watching. No shuffling fiche into a duplicator. And no chemicals, because processing is by heat only.

You're looking at a real system, not parts stuck together. A design that started with a blank sheet of paper and then took shape over the years as we listened to what you needed—and translated those needs into fresh ideas that are years ahead.

For instance, there's a systems manager. A powerful new business computer that actually runs the operation, and also provides instant system access when requested. One benefit is that less experience and training are required for operators.

There's also an exclusive buffer for fiche masters, automatic exposure adjustments triggered by bar codes, and a programmable

© Eastman Kodak Company, 1985

Another plus for fiber optics is its compactness. A fiber-optic cable as wide in diameter as a pencil may contain as many as 144 optical fibers, each fiber equal in capacity to a large coaxial cable plus a ribbon data cable. Size becomes a critical factor in installations where ceilings and floors are already clogged with coaxial cable or when underground conduits are full to overflowing with cable.

> **Perhaps the biggest advantage to the DP world is the integrity of signals passed over fiber-optic cable. Bandwidth of fiber-optic systems remains high, regardless of length, thereby eliminating signal degradation and poor picture quality.**

A big disadvantage of coaxial cable and satellite transmission is electrical interference from power lines, other cables, lightning and other weather problems and radio-frequency sources. Fiber-optic cables are immune to all forms of interference.

But perhaps the biggest advantage to the DP world is integrity of signals passed over fiber-optic cable. The high-frequency response, or bandwidth, of coaxial cable decreases with increased length. High-frequency signals are lost by coaxial cable over distance and a high-resolution picture degrades. Bandwidth of fiber-optic systems remains high, regardless of length, thereby eliminating signal degradation and poor picture quality. These factors become especially critical for organizations considering cabling for graphics terminals or computer-aided design and manufacturing terminals.

According to Richard Cerny, chairman and chief executive officer of Artel, a fiber-optic company whose niche is the graphics market, the bandwidth for graphics used to be 20 to 30 MHz. Recent trends, however, have been to increase resolution and refresh rate, both of which significantly increase the bandwidth. "With a 1,280 by 1,024 picture that's going at 60 MHz refresh rate, you have a 120-MHz bandwidth. That means coaxial cables have to be shorter and shorter. That's going in the reverse direction from what people want," Cerny said.

Even after taking into account the many advantages to fiber-optic cabling systems, price has been the most obvious stumbling block to widespread implementation. At a cost per cable foot of approximately $1.25 for coax, compared with the $3.12 per foot Rosga paid for Dallas' fiber-optic cable, the difference certainly appears to approach 300%. The cable installed for Dallas, however, was 12-fiber cable that could support 12 times 32 terminals, or 384 terminals, with multiplexers that might cost $500 each, at each end. Although coaxial cable can also support multiple terminals with the addition of multiplexers, it does not support nearly as many of them and it does not support them nearly as well. It also has none of the known advantages of fiber-optic cable.

Why then, given the choice, would anyone choose coaxial cable over fiber-optic cable? One reason might be the enormity of a failure, should one occur. When terminals are hooked to controllers via coaxial cable, should the cable fail, one tube goes dark. In the case of a fiber-optic highway in which fibers are connecting dozens of terminals to a mainframe via multiplexers on each end, a failure is a very big deal. According to Weinberg, however, the problem is very seldom in the fiber. "Once the cable is in, I don't think I can recall one [cable break] out of the thousands of networks we've installed," Weinberg said. Rather, he explained, the problem is in the high-speed electronics end, "and that's why we work so hard to preclude that from happening with tremendous overdesign, robust systems, burn-in and all the other things we do."

But according to Artel's Monk, the roadblock to overcome is lack of awareness of the extensive capabilities of fiber optics. The industry has no spokesman, he explained, and, although the subject is well-covered in the engineering design publications, it has not received wide attention in the computer-related literature. "Most of the companies in the business are small like us, and we don't have education departments. We aren't on the chicken circuit thumping the tub for fiber optics every 10 minutes. We don't do an extensive job of educating people. We could do a better job, and it wouldn't cost us much," Monk added.

Until the time fiber-optic education filters down to the rank and file of DP

management, use of the new technology will continue to be primarily the domain of telecommunications firms and government areas that need high security networks.

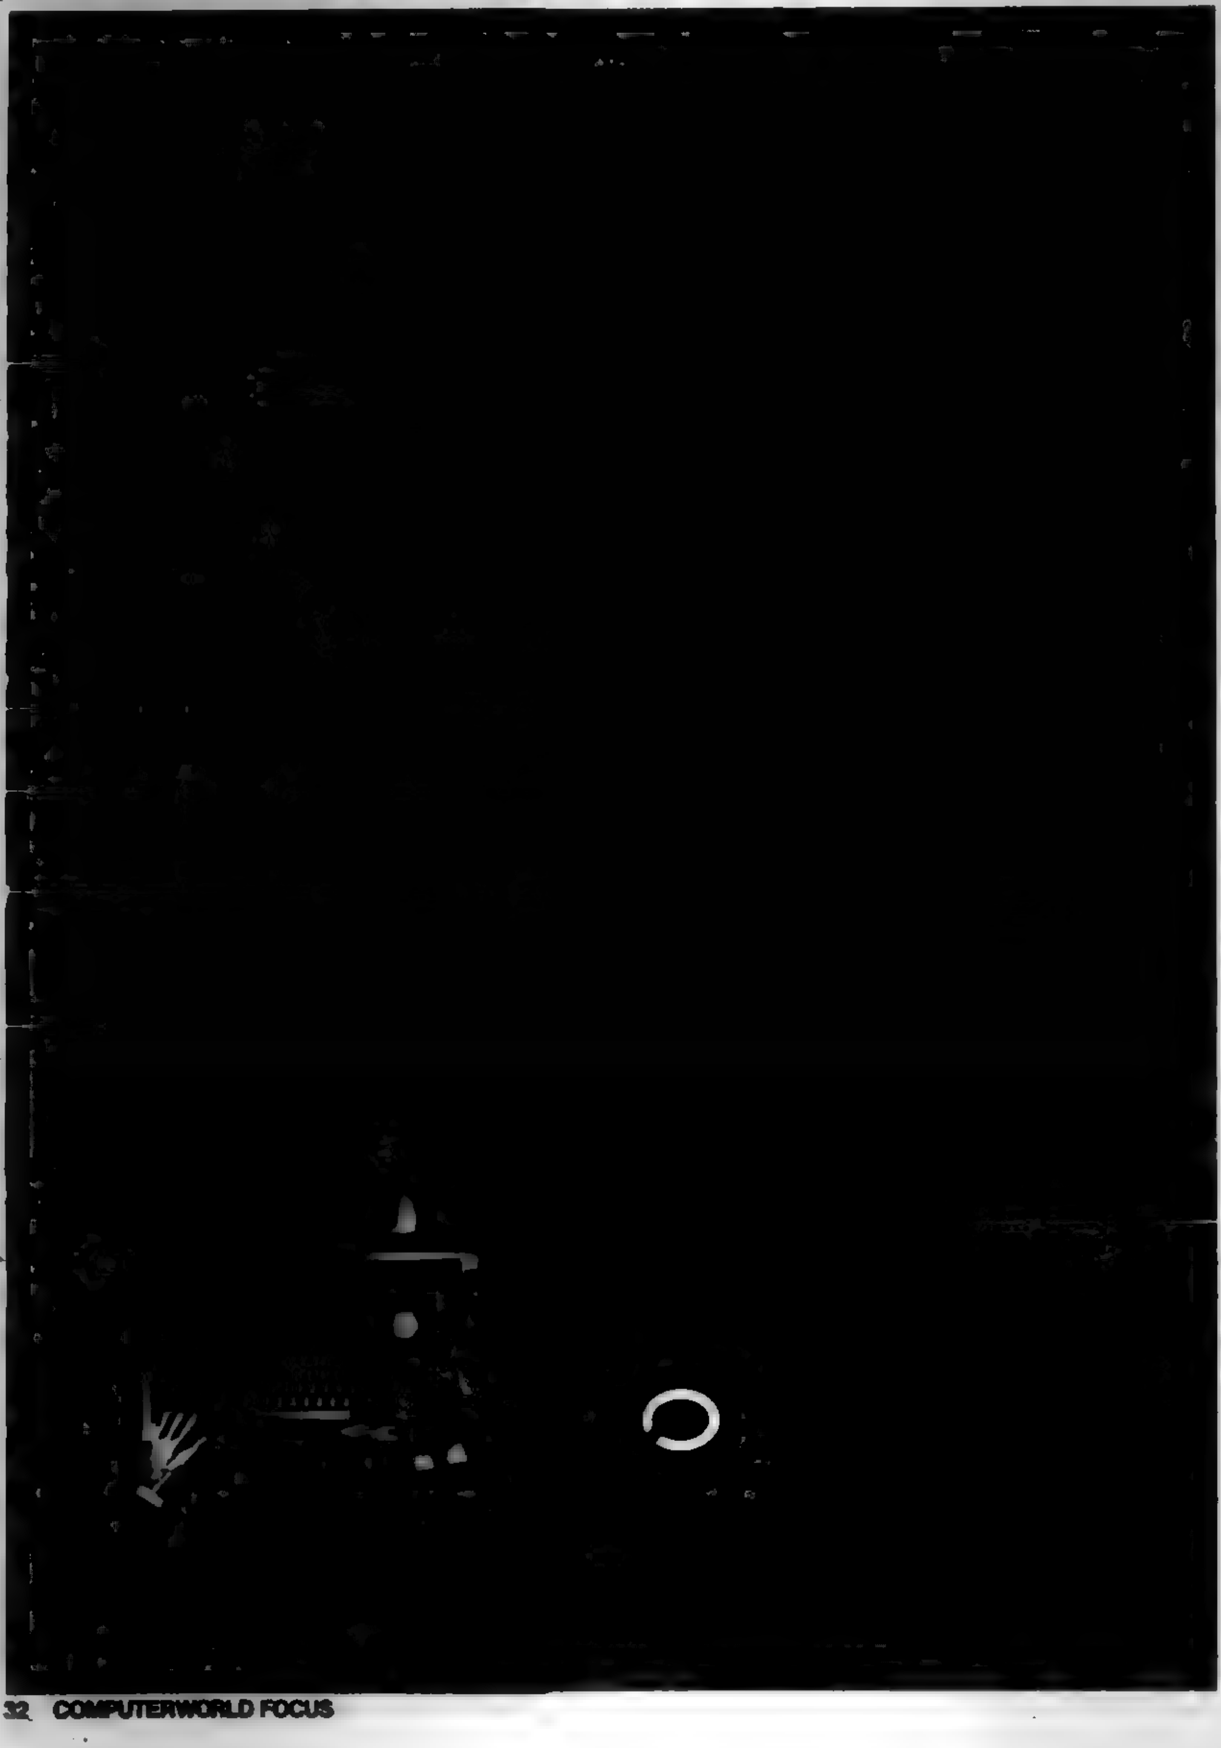
Companies constructing new buildings, however, are finding fiber optics is the most cost-effective and efficient way to go. Dave Stein, staff manager of business customer equipment for Southwestern Bell Telephone Co. in St. Louis, Mo., was involved in the decision-making process for data communications networks when his company built its new 42-story headquarters.

The choice of fiber optics was dictated in part by constraints that were in place, one of which was the inability to use the ceilings to pull ordinary coaxial cable. "The ceilings were air plenums and if we had put cables in the ceilings, they would have had to be Teflon-coated; the polyvinyl chloride jackets on normal cables put off chlorine gas if there is a fire around it," Stein explained. The Teflon-coated cable was prohibitively expensive and difficult to get.

Stein also wanted to get away from cable because of his experiences with it in the buildings Southwestern Bell had rented in downtown St. Louis. He found that when a cable was put in, it was never pulled out or reused, even if a terminal was moved. "They just pull a new cable and pretty soon you've got some places where you can see the ceiling literally falling down because of the weight of the cables," Stein said.

Stein and his team chose a fiber-optic network for the entire Southwestern Bell building, the tallest in the state of Missouri, figuring that once a good fiber-optic distribution system for data was installed, cable would never again have to be pulled. Even when the company changes computer systems or terminals, Stein enthused, "all we'll ever have to do is change the type of optical-to-electrical converters that go on the end of the fiber cable."

Southwestern Bell took a novel approach to its network. There is a horizontal floor distribution system with 11 nodes. Four fibers go out to each node from a wire closet, and each node location consists of eight workstations. The four fibers are brought out at the center of a workstation cluster, and at that point the optical-to-electrical converters are attached. Southwestern Bell then leads terminals off that converter with conventional cable.



The other part of their network is the vertical distribution system. With this network, eight fibers from each floor return to the 22nd floor, which is the heart of the system. From the 22nd floor, floors can be patched to one another. The horizontal network consists of 45.8 miles of fiber and the vertical net has 46.3 miles, for a total of 92.1 miles.

Of interest is the fact that Southwestern Bell purchased their cable from Belden Corp., even though AT&T is a cable manufacturer. Stein didn't find this unusual at all. "We divested from AT&T. We put out the bid to several different manufacturers and took the lowest bid that met the spec," he explained.

Southwestern Bell chose a fiber-optic net for the entire building, figuring that once a good fiber-optic distribution system for data was installed, cable would never again have to be pulled.

Stein's experience with AT&T should not lead anyone to believe the communications giant doesn't have a mighty strong foothold in the fiber-optic market. According to David Stonehill, vice-provost for computing at the University of Pennsylvania, AT&T is installing $8 million worth of fiber-optic cable and electronics to connect 130 campus buildings and interconnect parts of the AT&T Integrated Services Network (ISN) at the University of Pennsylvania (Penn). Although the University of Pittsburgh, Carnegie-Mellon University, Cornell University and Johns-Hopkins University all have fiber optics, Stonehill believes Penn is the largest installation to date in the ISN realm.

The enormity of the Penn installation is underscored by the fact that no "digging" has been necessary. "Some far-sighted person in 1973 put in a number of data tunnels," Stonehill said. "We have manhole covers saying 'U of Penn Data Communications,' along with steam and telephone."

There is little question the amount of money being spent by organizations such as the University of Pennsylvania will result in cost-savings in the future. Stonehill hopes to save money, but certainly sees cost-avoidance as a by-product. "The thing is, if communications connections keep moving along as they are — about 30% more each year — this will save a bundle in the next five to seven years."

FOCUS ON:
PLANNING

Local-Area Network Installation: Plan Now Or Pay Later

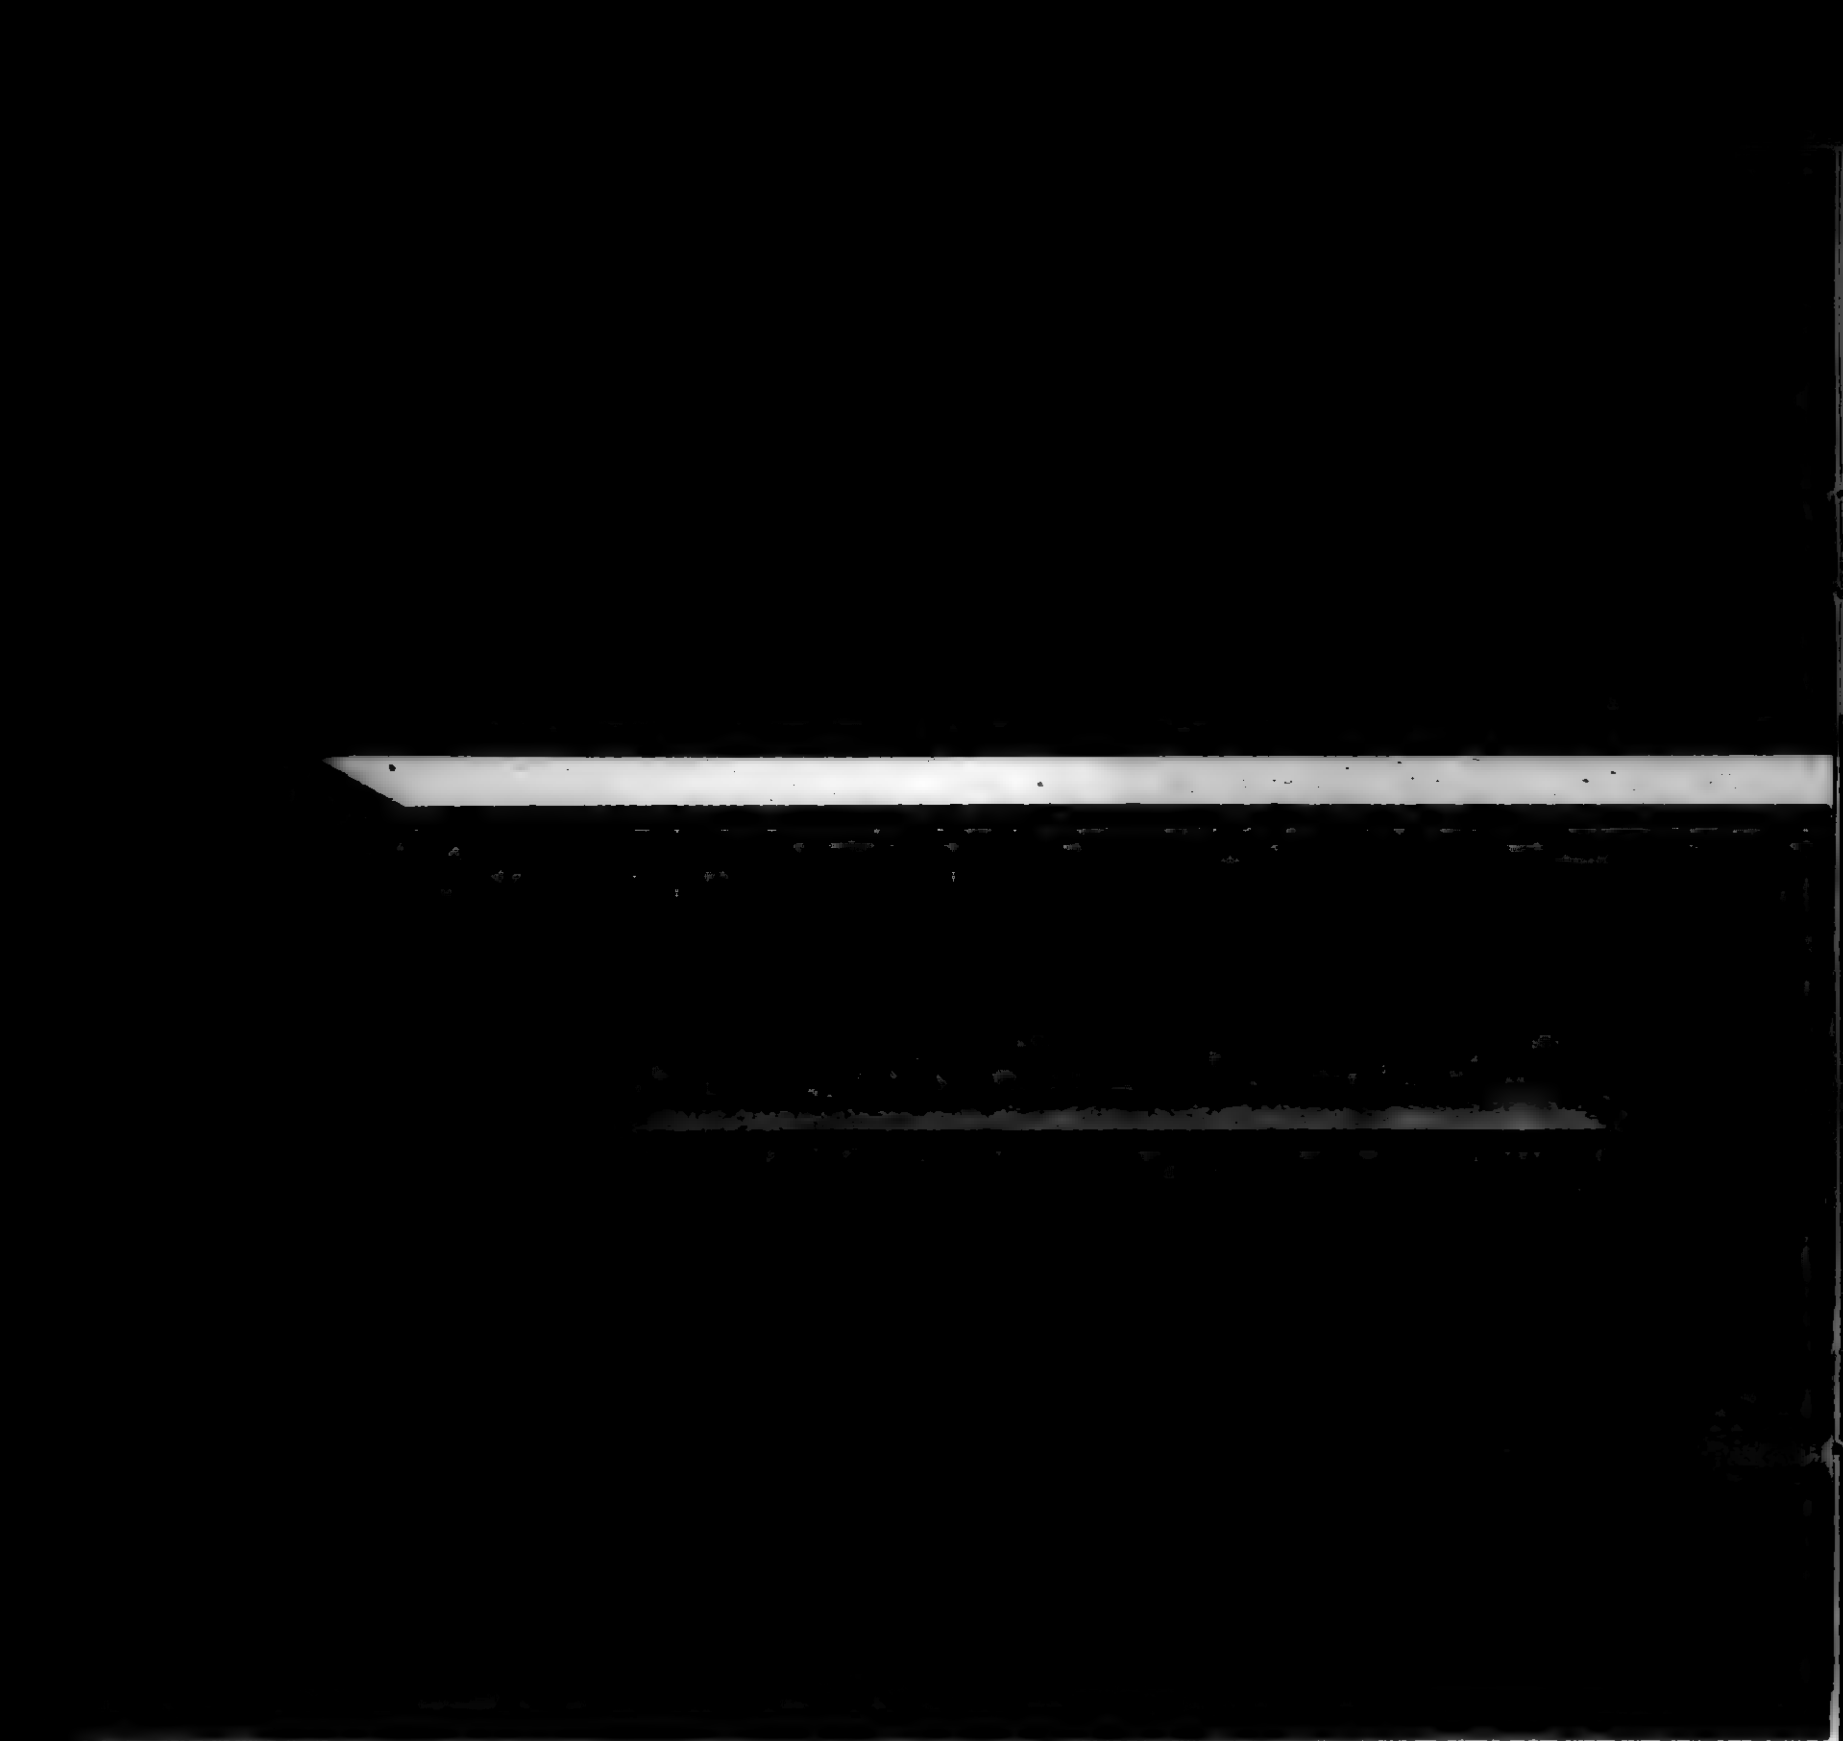
By Edward Cooper

A chorus of ayes could be raised in support of the statement that local-area networks offer many advantages. Modify that statement to include a description of how these networks should be installed, however, and that consensus would disappear, especially among management information systems managers. MIS managers who want to avoid headaches later will take time to be sure their planning has been wise and well-informed. The cabling design and installation a vendor provides will have a major impact on how smoothly a company's project proceeds, whether the specific local-area network technology is broadband, baseband or private branch exchange.

The local-area network market now contains more than 200 local-area network vendors, many of whom offer more than one installation option, and companies should familiarize themselves with the trade-offs and cost benefits associated with network installation. If the MIS manager makes the right choices in the beginning, the company will not only save time and money but will also ensure that future local-area net expansion will be easier. Someone within the organization should become very familiar with the capabilities of vendors, the technological details involved in local-area nets and the company's networking requirements. This knowledge will not only be useful in picking a vendor, but will also be crucial in assessing the best installation method.

A company has three installation options: It can install the network itself; it can use third-party vendors and hire consultants or contractors for certain aspects of installation; or it can have the network designed and installed by a vendor that offers a turnkey service. Because it demands a high degree of knowledge and involvement, the first option, the user-installed network, is probably the least popular choice. It does, however, offer some advantages.

Before the request for proposal can be written, someone in MIS or elsewhere in the company must be well-versed in the technology; otherwise, there is no way of knowing what equipment should be purchased and from whom. Even if members of the staff are technically competent, the company will often have to augment the group with a specialist or two. A local-area network consultant should be retained to review design and



YOU'VE ALWAYS KNOWN WHAT YOU
UNTIL NOW, YOU JUST COULDN'T

It's easy to see what you get with a CASE Series 4000 modem. And just as easy to control. All it takes is one finger.

You can configure and test everything through a touch-sensitive front panel. Scroll in four directions through an LCD display that speaks back to you in plain English.

Add a DXM diagnostic card and turn your Series 4000 modem into a network management center. Now you can monitor, configure, option, control and test point-to-point or multidrop remote units, all from the front panel of one modem, at one site.

Through DXM's message exchange, you can even put your finger on the front of any other modem in your network, as if it were right there. Which eliminates costly phone calls to remote site operators.

Build a whole network of Series 4000 modems all by themselves. Or open that net-

equipment specifications. System layout is a craft that relies on repeated trials and comparisons, rules-of-thumb and experience. Without this expertise, a novice will find it difficult to predict all the "oops factors."

A properly designed network has the major advantage of being able to be expanded more easily. When the initial design is created, a company should consider future applications, know the maximum geographical extent of the local-area network and do a thorough building survey.

After network architecture and topology have been determined, other key decisions include location of the network maintenance center, backbone design and level of redundancy within the network to ensure maximum reliability.

After the design has been completed, the funds allocated and the products ordered, an array of local-area network equipment will be drop-shipped to the company's door by the many different vendors.

The do-it-yourself method of installation will take longer and can be more problematic than other installations. Four months or more can pass before an average-sise network is up and running.

Self-installation can cause upheaval within the company because in most cases personnel will not have had the experience of putting in a local-area network. Also, staff members who otherwise would be performing regular jobs will now be working on the local-area network project, which will put a burden on the rest of the staff.

The advantages of the do-it-yourself option are that the company's data processing specialists will have more control over the network and be more self-sufficient in maintaining it. Also, during the long and complicated process of network design and installation, staff members will have had excellent on-the-job training in local-area network technology and operation. As a result, they will be better prepared to repair and expand the network.

Nevertheless, this installation option is now less popular than the other two options for several reasons. Purchasing many products from many local-area network equipment suppliers will cause confusion in the form of multiple purchase orders and a drawn-out purchasing cycle. MIS managers will be vying for resources within the company for each equipment purchase and subsequent installation. Finally, buying equipment at lower volumes can result in a more expensive local-area network.

Although some companies assume self-installation will cost less, this is untrue. The cost of the extensive time a staff spends in learning, designing, installing and maintaining the network should be considered a local-area network cost.

Although some companies assume self-installation will cost less, this is untrue. The cost of the extensive time a staff spends in learning, designing, installing and maintaining the network should be considered a local-area network cost. Another handicap of user-installed local-area networks is that some time may elapse before they are operational. Many companies don't want to wait.

The second option — using third-party vendors — is a more popular choice than self-installation. When the third-party vendor choice is made, either the MIS department designs the network or the company hires design consultants. Equipment purchase becomes the company's responsibility, although some vendors will provide service during and after installation. In most cases, a contractor will be hired to install the transmission medium, which is usually coaxial cable.

As in the case of self-installation, this option works best if at least one staff member is knowledgeable about local-area network technology and the requirements of the network. This staff member's knowledge will make it easier to create the performance and design specifications and the acceptance criteria the cable consultant will need to install the transmission medium correctly.

Usually, the company purchasing agent confers with the contractor about performance and design specifications and acceptance criteria. The contractor will then get clarification on certain points, make recommendations and present a bid.

The final negotiated price can increase if something was forgotten or if complications occur with the job. Using third-party vendors is more demanding on a company's purchasing department because separate purchase orders must be budgeted, negotiated and drawn up for each consultant, contractor and supplier.

After the contractor installs the transmission cable, the company attaches its equipment to this transmission medium. Future communication requirements should have been taken into account during the initial planning; the network almost always needs to grow immediately. Most companies find that when a network is installed and people within the organization see its benefits, the demands for network expansion will surpass original expectations.

Putting in an average-size local-area network usually takes two months or more when the third-party vendor option is chosen. Installation is faster with this method than with self-installation. Less disruption occurs within the company because most personnel are still performing regular jobs. However, a certain amount of upheaval takes place when workmen and representatives from different contractors and vendors are on site.

In the case of the backbone system, the contractor usually includes a warranty with installation. The contractor can, however, also offer maintenance service under a separate contract. Most companies utilise this service because they do not want to maintain the transmission system themselves.

What happens if equipment problems develop? This fear constitutes one of the biggest drawbacks to the third-party vendor approach; various suppliers and consultants frequently indulge in finger-pointing exercises rather than quickly isolating problems in the local-area network. When a device breaks, the failure must be located, the defective unit replaced and the system returned to operation. Most vendors, understandably, want someone else to be responsible.

The third option — using a turnkey vendor — is quickly becoming the method chosen by many companies installing a network. A few local-area network vendors offer everything from initial network design to long-term maintenance as part of a single consolidated package. The turnkey vendor looks at a company's communications requirements, draws up a workable design that keeps future expansion in mind, installs the network and then trains staff in equipment use. Finally, this vendor will maintain the network.

One vendor does everything. This greatly simplifies purchase and approval cycles because only one purchase order is required. Unlike the second option, which uses multiple vendors and contractors, the choice of a turnkey vendor involves just one price quote, which includes everything involved in the local-area network. The customer is given a clear picture of the actual cost of a network.

Tracking all the costs — particularly time put in by staff members — is often difficult when a company installs its own network or hires contractors. At first glance, the price quoted by a turnkey local-area network vendor might seem much higher than the prices of the other available options. If a company tallies the entire expense of other installation methods, the cost of the turnkey approach will be about the same.

Putting in a system as complicated and expensive as a local-area network creates anxiety for those within the company responsible for it as well as among staff members in general. A proficient turnkey vendor will have asked all the right questions beforehand. The Murphy's Law syndrome that occurs with distressing regularity in network installation can usually be avoided.

Installing an average-sise local-area network through a turnkey vendor takes about six weeks. Less internal disruption results than with any other method. Few company staff members are involved, and the vendor's well-trained installation crew is experienced in putting in cables and components smoothly.

Turnkey vendors also offer the advantage of taking singular responsibility for any problems with the network. Most MIS departments, which usually handle the company network, are chronically understaffed and being able to call just one vendor for problems or repairs is very convenient.

The disadvantage in going with a turnkey vendor is that sacrifices must be made in the area of response time should network problems occur. An outside vendor will never respond as quickly as well-trained, in-house technologists. Most vendors will allow a company to specify response times as part of the contract or will include an on-staff expert in the original deal.

Companies should be demanding as well as choosy when they select a vendor. They should think of today's needs as well as tomorrow's. Each vendor offers something different as does each installation method. Managers owe it to themselves and their companies to become aware of the costs and benefits and to decide what works best for their organizations. ‡

Your SNA Network – Do You Manage It or Does It Manage You?

By Thomas W. McDonald

The communications network is the circulatory system of today's corporation. It is responsible for maintaining the flow of corporate information among all appendages and branches of an organization. A network that operates in degraded mode or totally fails causes repercussions that are felt throughout the corporation, all the way from customers through middle management to senior executives. Degraded network service translates directly into lost productivity. An unhealthy network means service-level objectives are not met, tasks are not completed on time, budgets are overrun and, finally, corporate business plans fail.

Maintaining the flow of corporate information, consistently and cost-effectively, through Systems Network Architecture (SNA) networks is essential. To accomplish this task, a properly implemented strategy of network management will fulfill two criteria. First, it will allow service-level targets of end-user response-time and network availability to be met in a confident, consistent and cost-effective manner. Second, it will allow the network manager to change posture from a reactionary pose of fire fighting to a more proactive stance of anticipation and planning. A key point is avoidance of crisis. When the problem exists, damage has already been done. When the user is experiencing the problem, it is too late.

A critical step is identifying any transaction rate, activity or service that could cause available capacity of individual network resources to be surpassed to the extent that the network fails to meet its service-level targets. To accomplish this goal, the network manager must be in a position to evaluate the current network, optimize the performance of current network resources and plan for the integration of new users and services into the network.

The network manager who successfully implements this strategy will be able to determine when to provide additional service from the existing configuration and when it will become necessary or cost-effective to justify expenditure for additional resource.

The first activity necessary to implement a plan of network performance management is to produce network performance reports that allow the network manager to evaluate the utilization of the resources in the network. For example, information in these reports would tell if a front-end processor is approaching a slowdown (buffer depletion) condition or if a line utilization is reaching a critical level. A review of some simple performance reports will point out underutilised resources and resources pushed to capacity.

The reduction of network measurement data is the foundation of a successful strategy of network performance management. The first step is the reduction of performance measurement data.

The most obvious gauge of how well the network is performing is response time measurement. Response time information can be gathered by hardware or software measurements. Almost all software response time monitors work by implementing a trace in Vtam (the communications access method in the host processor). This trace will time stamp a message at five points. Reduction of this trace data shows the time the message spent in Vtam, in the host environment and network time. This data is collected and reduced in batch mode. Reports that are produced tell the response time as experienced by the end user. This trace can be initiated on a user and/or application basis. This method allows accurate information on end-user response time to be gathered and breaks the response time into major components of host and network time; however, this method also has two major drawbacks.

The first drawback is the requirement that a definite response be requested by the application. Without the implementation of definite response mode, no network response time information can be produced. In most cases, the implementation of definite response puts only a minimal overhead on the network.

The second drawback is the overhead in running the trace, storing accumulated trace data and reducing that data. Although processor overhead is usually acceptable during the running of the trace, space for storing continuous trace data for large networks is considered a problem at some sites. This second drawback can be overcome by running the trace selectively. If it is feasible to implement definite response mode in the application and to control storage resource, accurate end-to-end response time information can be produced by the use of a software monitor.

If response time measurements that can be viewed in a truly real-time fashion are needed, a hardware monitor is the tool required. If you need immediate knowledge of what response time end users are receiving at any moment, the delay incurred in the reduction and processing of software monitor trace data will be unacceptable.

By interacting with the network at the digital interface between the front-end processor and the modem, the hardware monitor can remain transparent to the network while it monitors all messages going across the lines to which it is attached. It breaks response time into major components: inbound and outbound transmission time, poll wait and host time.

A hardware monitor, however, also has drawbacks. The first is cost. To completely monitor a medium-size to large site, purchase costs can easily climb into the $250,000 to $500,000 range. Those who are willing to look at the network piecemeal will find that a less expensive approach is available. For example, for well under $10,000 a user could purchase a single line monitor that would tell the response time for all terminals active on a line as they access all applications. It would also break this response time information into its major components.

The second drawback occurs in both multiline and single-line configurations. Because the hardware monitor interfaces at the line side of the front-end processor, the amount of time it measures as the host delay is actually a combination of total time in the front-end processor and the host environment. For a hardware monitor, host time includes any time spent in the front-end processor due to outbound queuing at the line; any delay caused by insufficient buffers or cycles in the front-end processor; as well as any delay in the host processor, memory or I/O configuration and so on.

IT'S TIME TO STOP PUTTING BAN

Without doubt, the proliferation of personal computers throughout your organization has done much to increase personal productivity within departments.

But it has also given rise to an increasing – and alarming – decentralization of information, much of which is vital to the whole organization.

The answer, of course, is networking – tying together groups of PCs on a system that allows them to communicate with others.

Unfortunately, however, most currently available networking solutions address only part of the problem. Sure, they tie compatible PCs together within departments. But can they communicate with similar networks in other departments?

And where does that leave the information needs of the company as a whole? What about communications between non-compatible PCs, LANs, host minicomputers and mainframes?

What is really needed is a solution that addresses all of your networking problems. A solution like Banyan's Virtual Networking System.

Unlike LANs and other partial solutions to the problem, Banyan approaches networking from the standpoint of distributed computing, where one or more LANs must be supported within departments, between departments, between buildings or even in other cities.

Likewise, network time is not broken into components of local-line time and internodal or backbone time. In most cases, this detail is insufficient for solving response time problems.

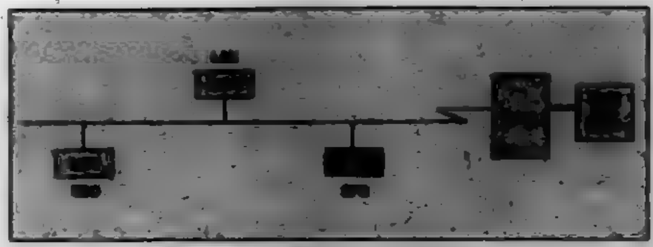

Figure 1. Full-Duplex SDLC Line

Without doubt, the hardware monitor is unsurpassed for accurate real-time data on end-user response time. For cases where the question is why response time is poor, however, the hardware monitor often offers incomplete answers. For those who have access to true host time figures or to a model of the network (for example, Best1/SNA), the host time can be broken out into front-end processor and true host time. A model will also break the network time into boundary time and intermediate backbone time.

There is a class of simpler hardware monitors — control unit or terminal monitors — which are less expensive and easier to implement than line monitors. They report total response time for users at a particular terminal or control unit, but do not break response time into component parts.

Although response time continues to be the most popular indicator of network performance, no simple inexpensive method allows continuous comprehensive response time information to be reported.

Other indicators of network performance do exist. Equally important data can be found in products that allow the determination of utilization of the major network resources. For example, IBM's measurement tool — Network Performance Analyzer (NPA, now a subset of NPM) — allows the user to see utilization of the front-end processor as well as line and control unit utilization. When response time information is unavailable, a review of resource utilization will often point to the problem areas of the network as well as the overconfigured areas.

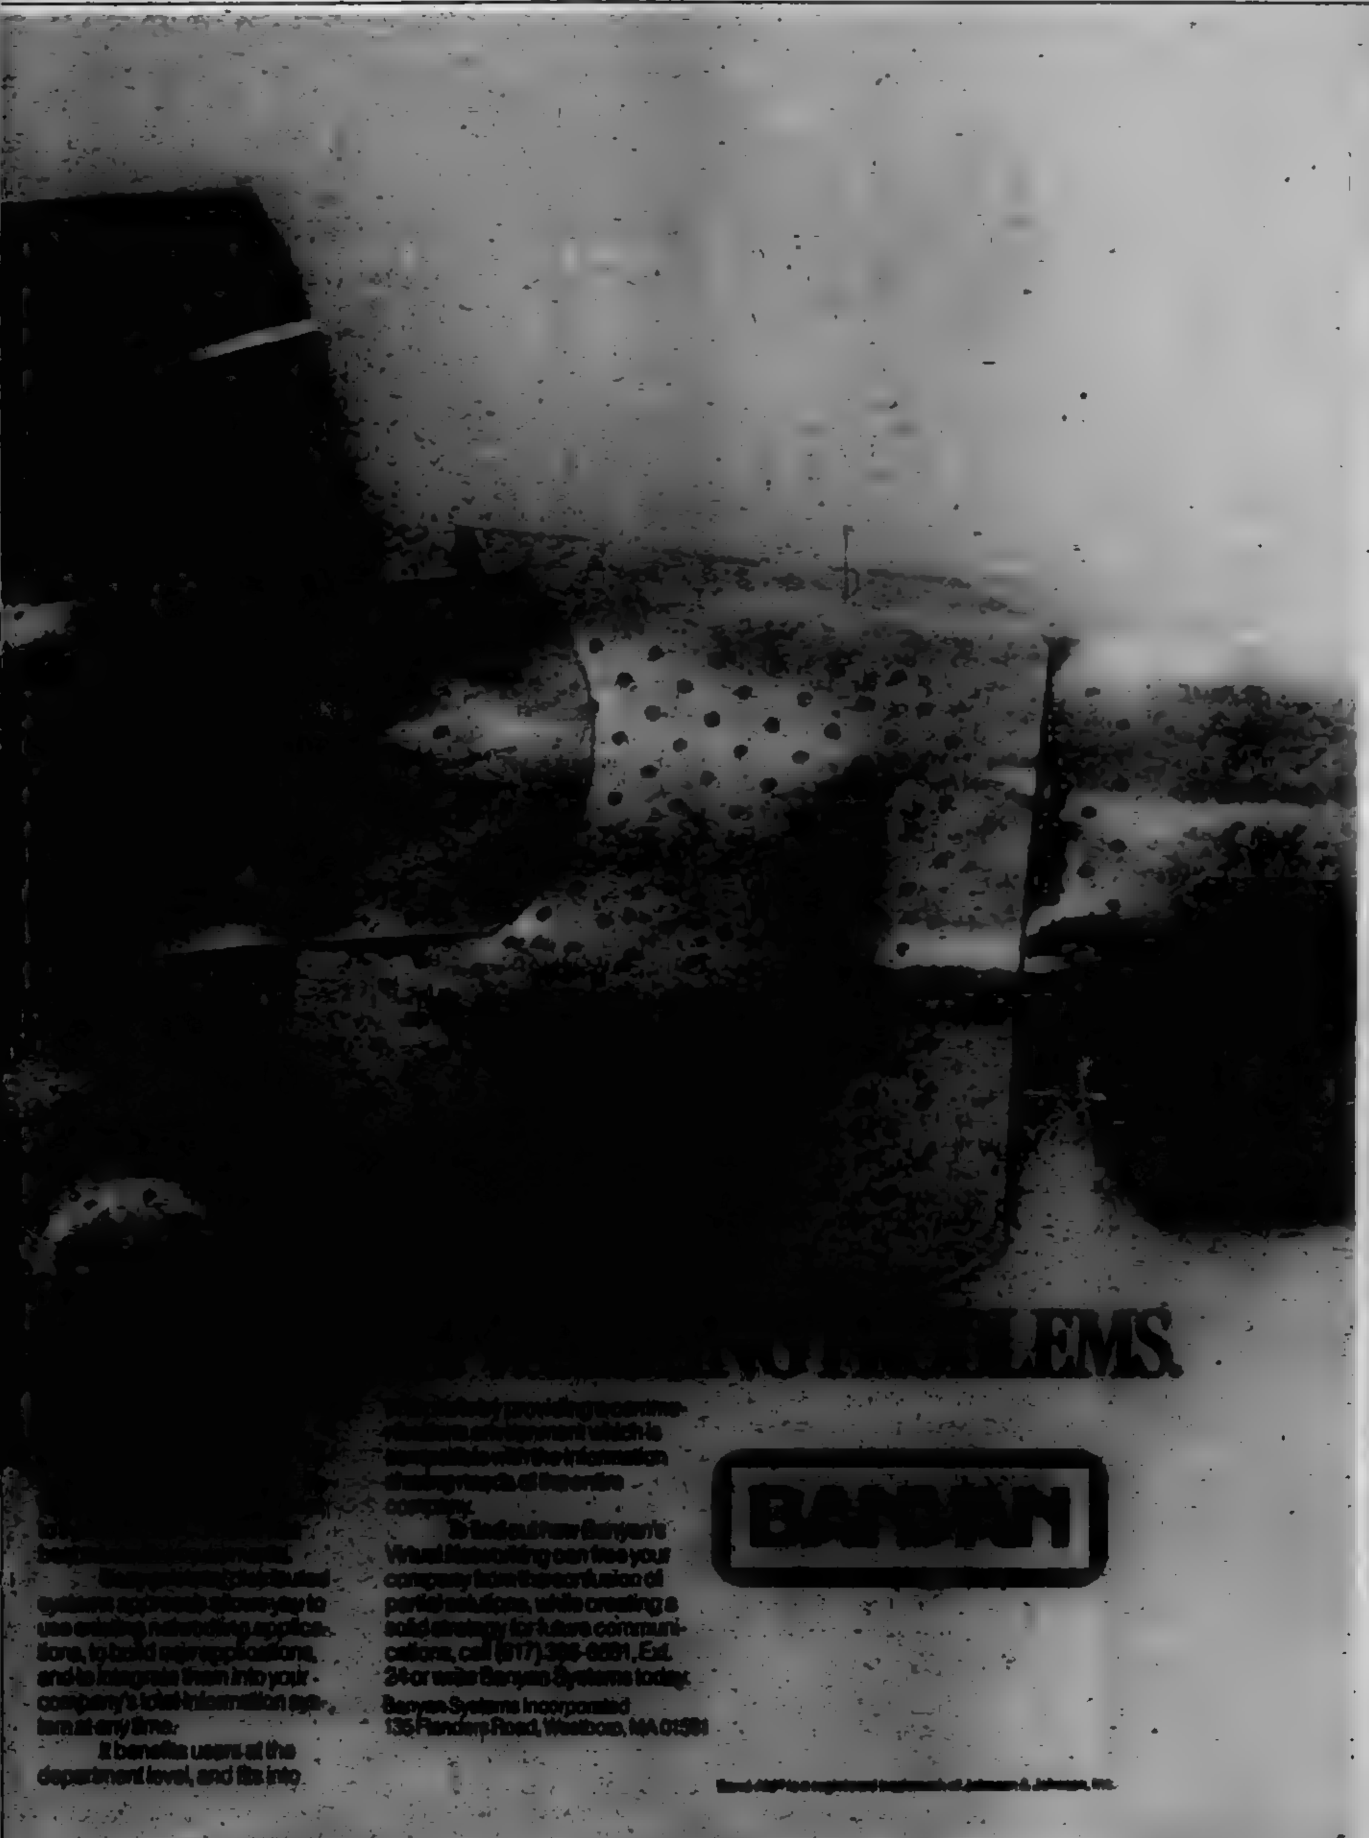
Successful completion of this first step — production of performance reports — allows the network manager to be alerted to potential problem areas in the network and to look at the balance between network cost and service. The network manager is able to make a gross approximation of where the network is overconfigured and where it is lacking resource. The network manager is able to weigh the dollar cost of existing hardware and software as well as personnel salaries against the service the network is providing.

After the baseline has been established, the second step is performance tuning and balancing. In this step, the network manager can optimize the service being delivered based on effective use of resources — to provide the best network service for the network dollars spent.

Whenever possible, tuning is chosen over adding resource when new users are added to an existing network or when new service is required. Tuning allows new users to be added or better service to be provided for existing users without spending any money.

The most obvious method of tuning is reconfiguring lines, control units or terminals. Configurational tuning simply means moving hardware and users into different physical arrangements. The user experiences a better level of service as more of the network resource is dedicated to him.

Another kind of tuning is software tuning. SNA is a cost-effective network architecture because it allows end users to share resources. The control unit resource is shared by the terminals, the line resource is shared by the control units and the front-end resource is shared by the lines. SNA has tuning parameters (PASSLIM, PACING, RUSIZES) that allow priorities to be set for service to individual users in the network.



[illegible] PROBLEMS.

[illegible] because [illegible] requirements.

Banyan's [illegible] distributed systems approach allows you to use existing networking applications, to build new applications, and to integrate them into your company's total information system at any time.

It benefits users at the department level, and fits into [illegible] providing a communications environment which is compatible with the information sharing needs of the entire company.

To find out how Banyan's Virtual Networking can free your company from the confusion of partial solutions, while creating a solid strategy for future communications, call (617) 366-6681, Ext. 24 or write Banyan Systems today.

Banyan Systems Incorporated

BANYAN

Band-Aid® is a registered trademark of Johnson & Johnson, Inc.

Figure 1 on Page 39 shows a full-duplex synchronous data link control (SDLC) line with IBM 3274 control units in San Francisco (SFO) and Los Angeles (LAX), and a less active control unit in San Diego (SDO). Figure 2 shows response-times and line utilization for these 3270 users. The users are accessing IMS and CICS and receiving total response-times of about three seconds. (The inbound and outbound message sizes are approximately 40 bytes and 240 bytes for IMS and 30 bytes and 210 bytes for CICS.) From this performance report, the network manager knows the service-level objective — four seconds — is being met.

A short time later, the network manager receives complaints about response-time on the line. Again, a response-time report for that line is gathered. Figure 3 shows the new response-times. All users are experiencing a degradation in service. Upon closer inspection, the network manager discovers 3279 color graphics terminals have been added to the San Diego control unit. The graphics outbound message size is about 3,000 bytes. This work load has a serious impact on existing users. The large graphics messages are using up more than their share of the line and are blocking other users on the line.

How can service levels be restored their targets for all users or for as many users as possible? Figure 4 shows that after adjusting the PASSLIM value from seven to two for the graphics control unit (thereby prioritizing flow to LAX and SFO by allowing them seven frames per service and SDO only two), response-time for IMS and CICS can be brought back into a reasonable range. To provide low response-time to all users on this particular line, it would be necessary to add resource.

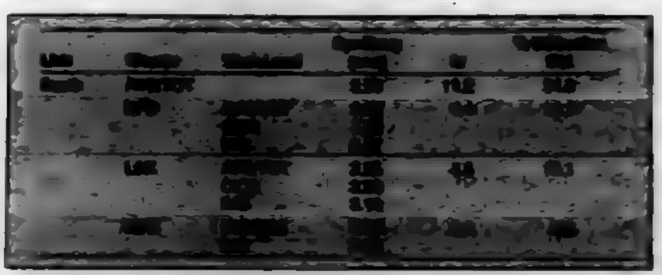

Figure 2. Principal Results Report, 6/30/86, 10 a.m. to 11 a.m.

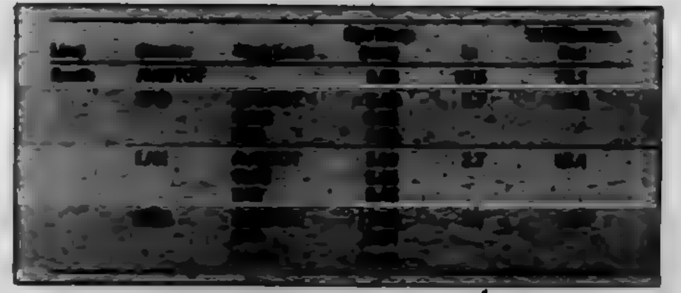

Figure 3. Principal Results Report, 7/8/86, 10 a.m. to 11 a.m.

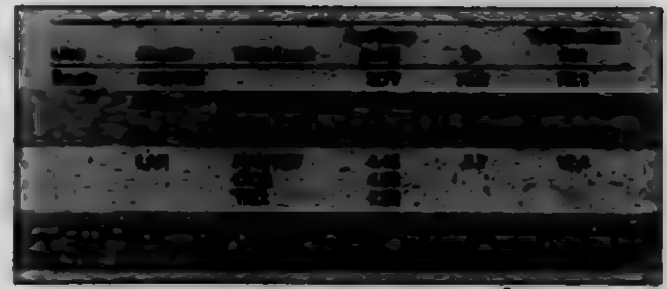

Figure 4. Principal Results Report, 7/8/86, 10 a.m. to 11 a.m.

By balancing and tuning network components, the network manager can control network service among users and optimize the balance between the amount of money spent on network resources and the service the network is delivering. The manager can determine when existing configurations can provide new service and when adding resource to provide new service is cost-justified.

Balancing and tuning the network is not without risk. Tuning as a way out of performance problems or a means to accommodate new users has the major advantage of no visible costs. However, a great risk is associated with this approach. Tuning data flow control parameters is not simple or predictable. Prioritizing and deprioritizing service can have adverse effects on network performance. A change that improves some users' service might have disastrous consequences to others.

Because the network manager is intent on crisis prevention — reacting to problems before they occur — network modeling is crucial. By modeling the proposed tuning changes before their implementation, the manager can predict the system-wide effects of the tuning change before implementing it.

In the example above, the risk-free way to implement change in PASSLIM is to model the change before the new PASSLIM is integrated into the NCP GEN and implementation takes place on the live network. Modeling shows any positive or adverse effects of changing the parameter, eliminates experimentation on the live network and plays a further role in performance management in the network planning phase.

Capacity planning is the third activity required to properly manage the performance of an SNA network. If consistent service levels are to be maintained and the corporation is to continue to meet its goals, crucial new network activities must be anticipated and, if necessary, appropriate compensatory action must be taken while time allows.

The heart of a successful capacity planning strategy is the modeling function. Modeling the network allows the network manager to assess the impact of new users, services, hardware or software before the change takes place.

In the tuning example above, if the proposed graphics users had been modeled before actual implementation in the network, no degradation in response-time would have occurred. There would have been no need for lost production or revenues or bad morale caused by poor response time experienced between the time of adding the new users and implementing the tuning solution.

When new users are added to an existing network, the network manager has the following three main concerns: What hardware (terminals, printers control units, lines) is required in the local and intermediate nodes to support the new users? Can the service-level objective be met with existing resources? Will the new users adversely affect the service of the current network users?

The network model will indicate which configuration of hardware and lines are appropriate for these users. This decision can have a great impact on network cost. For example, an IBM 3274 control unit can support up to 32 devices. Modeling results indicate the performance of different numbers of terminals per control unit. If 10 control units can service 200 terminals as well as 15 control units can, the network planner must be aware of this. A 3274 control unit purchase runs between $6,000 and $12,000. Significant amounts of money ride on these hardware decisions.

After the terminal/control-unit configuration is settled, the number of control units per line must be decided — the second area of configurational planning where the model plays an important role. The model will indicate the optimum number of control units that may share a communications line.

When the configurational question has been answered, the service-level concerns of new and existing users can be addressed. Modeling allows you to cost-effectively plan for the integration of new users and service to the network. It allows you to look at potential service-levels and costs associated with delivering those service levels. The crisis situation can be avoided.

Today's corporations call on the data communications network to deliver their lifeblood — information. The network manager plays a crucial role. Network performance can be directly translated into corporate performance. A network can be a consistent and dependable component of the corporate plan through the implementation of a strategy that employs measurement, tuning and planning and allows modeling to play a strategic role.‡

McDonald is senior consultant for data communications, BGS Systems, Inc. in Waltham, Mass.

Data switching: Equinox makes it simple.

Introducing the Equinox Data PBX; a port selector that makes switching terminals between computers as simple as dialing a phone number.

Installation is simple; do-it-yourself using regular telephone PBX-type cabling and connectors.

And it's simple to integrate into your system, thanks to our super friendly, self-explanatory configuration menus.

The system grows to meet your needs, from 24 to 1320 lines. And the state-of-the-art design combines performance and reliability in a compact package that won't break your budget.

Check out the most full-featured Data PBX on the market today; call 1-800-DATA-PBX, for an on-site demonstration.

Life in the Fast Lane–Can Telecommunications Managers Keep Pace?

By Stan Kolodziej

Today's telecommunications manager lives life in the fast lane — at least in a corporate sense. The January 1984 divestiture of AT&T opened the flood gates to new communications products, technologies and vendors — all aiming their respective sales guns at beleaguered telecommunications managers who are running hard to keep up.

Telecommunications managers find their galaxy of communications suddenly part of a vast, complicated universe. Where there were once only analog, there is now digital; where there were only twisted-pair wiring, there is now cable, microwave, fiber optics and satellites; where computers and telephone exchanges were once apart, they are now being married; where tariffs were simple, they can now produce migraines.

Communications technology is leaping forward. T1, statistical multiplexers, network managers and computerized branch exchanges are part of the new telespeak. Local-area networks, hybrid private branch exchange (PBX)/local-area networks and PBX versus local-area networks remain controversial topics. Network standards are the next hot contention points: IBM's Systems Network Architecture (SNA) versus integrated services digital network, open systems interconnection versus SNA, broadband versus baseband and General Motors Corp.'s Manufacturing Automation Protocol versus everyone.

Telecommunications managers must keep pace simply because they have suddenly been thrust into the center of the telecommunications vortex. More is expected of the telecommunications manager because more is expected of telecommunications. As a result, perceptions of corporate telecommunications are changing.

According to Dan Muecke, vice-president of technology at Bankers Trust New York, "Telecommunications was once perceived as a cost control center with little business impact. Now it's recognized as an area where corporations can gain a direct competitive advantage."

Duane Heidell, vice-president, corporate telecommunications at Marriott Corp. in Washington, D.C., and president of the Dallas-based International Communications Association, said telecommunications management "is viewed not so much as a technical exercise now as it is a business management function."

Telecommunications in larger corporations is being reshaped to fit into the corporate cutting edge. Telecommunications is a strategic offensive weapon, no longer on the defensive.

Corporations have increased their telecommunications operating budgets on an average of 11% in 1985. New telecommunications employees are commanding up to $35,000 in starting salaries, with directors and managers culling $100,000 and beyond.

Ironically, all this new attention can create an identity crisis. Telecommunications is getting more room to flex its muscles, but sometimes it finds there is no audience. This is not surprising because senior executives have been nurtured on two decades of IBM-dominated data processing. Corporations have long accepted at face value the importance of DP. Not so with telecommunications. Perceptions of telecommunications as a cost-cutting role will take time to change. Until then, telecommunications managers have a selling job — to convince those controlling the purse strings that telecommunications deserves its new place in the sun.

"Telecommunications has been around longer than data processing, but the concept of data and data processing has always been easier for executives to understand and consider important," explained Mary Johnston, senior analyst at the Yankee Group, a market research firm in Boston. Telecommunications can, therefore, find itself at a disadvantage. Management information systems, a DP domain, has over time paved avenues of access to executive power structures in many large corporations.

Equipped with little boardroom clout or inroads to corporate power, telecommunications departments can find themselves in a dilemma: while new technologies increase the competitive importance of telecommunications, only a few telecommunications managers possess the corporate support that is required to transfer this power into tangible benefits for their own departments.

The benefits of technology can be further fickle. The thrust of the new communications technology focuses on integrating voice and data. Though traditional voice analog technology kept telecommunications a weaker corporate department, it also kept it separate and often autonomous. Digital data, however, forms the lifeblood of MIS. And, like an extension of some natural law, the greater the role digital technology plays in telecommunications, the greater the influence of MIS over telecommunications.

Though the sway of MIS over telecommunications was strengthening even before local-area networks and digital PBX came to the fore in the early 1980s, the divestiture of AT&T seems to have accelerated the process. In response to the confusing array of tariff rates and vendors, many corporate executives have decided to face uncertainty with a united front — usually in the form of a merger with MIS. Many telecommunications managers have found themselves in the paradoxical position of having increased prestige (and salaries), but decreased autonomy, often reporting to the MIS director or equivalent.

Another corporate tactic gaining ground is to keep telecommunications and MIS separate, but place them under an umbrella information group. As industry watcher Johnston pointed out, however, the supposed emphasis on separateness can be misleading. "Some companies," she said, "are saying they hold telecommunications on an equal footing with data processsing. They place the two under an umbrella organization, but typically the person in charge of the umbrella group is from MIS. There are a number of parallel organizations [from telecommunications and MIS] in the making, but it seems that MIS is taking the lead and getting more people at the top."

If this is the case, many corporations don't seem to mind. Muecke explained that a year ago at Bankers Trust, after both departments were merged under a new technology umbrella group, the telecommunications manager and the MIS director became "peers." They report to

WHEN YOU'VE GOT IBM, YOU'VE GOT EVERYTHING. ALMOST.

Renex's new BI-PATH™ reverse protocol converter lets IBM users do the one thing they can't do now...talk to ASCII hosts and peripherals.

BI-PATH gives your 3270 flexibility—including access to a wide variety of ASCII mini systems, public service data bases, service bureaus, packet networks, electronic mail systems, and microcomputers.

Since BI-PATH is installed at the terminal, it is completely transparent to the host or the communications protocol being used.

And what else?

BI-PATH supports serial printers to provide hard copy of all data sent and received through your ASCII modem port. Simply attach any RS-232-compatible printer, and complete VT-100 with auxiliary printer is duplicated on your 3278 device.

For over ten years Renex has provided the ASCII world with the ability to emulate IBM. Now let BI-PATH convert you to the benefits of ASCII.

Make your IBM complete. Call Renex today at (703) 494-2200.

the same executive vice-president, and things are working out nicely.

Harry Venable, director of telecommunications services at Celanese Corp., Charlotte, N.C., said although the telecommunications and management services (MIS) departments at Celanese report to the same vice-president, they are separate at the director's level. Venable stressed this has been in effect and working admirably for years.

At Shearson-American Express Corp. in New York, telecommunications and MIS were separate until a few years ago, when they were merged under the umbrella communications systems group. Andy Sokolov, senior vice-president, said, "Now that voice and data are using the same T1 systems and there is a good deal of joint coordination in effort and implementing [office] branches, it makes sense to combine these forces under an umbrella group." Sokolov reports directly to the executive vice-president of MIS.

In a recent poll conducted by The Conference Board, Inc., New York, the group found almost 40% of the companies responding had the MIS executive sharing responsibility for telecommunications planning with the telecommunications manager. The actual number, however, is generally agreed to be even higher.

Just as major technical forces such as T1 transmission seem to be bringing telecommunications and DP together, some smaller forces that are steadily growing in importance are pulling them apart. Many forms of bypass technology such as fiber optics, microwave transmission systems, satellite stations and teleconferencing are increasingly being used as ways of circumventing overburdened public telephone and packet-switched lines. As these new technologies gain ground, so does the influence of MIS.

"A lot of telecommunications products and services are now being marketed directly to data processing people," explained Jerome Lucas, president of Telestrategies, Inc., a McLean, Va., consulting firm. "In our case, we're seeing a lot of small-apertured satellite earth stations for two-way transmission being purchased directly by data processing people. The data processing people have a strong interest in things like satellite networks because it gives them total and complete control."

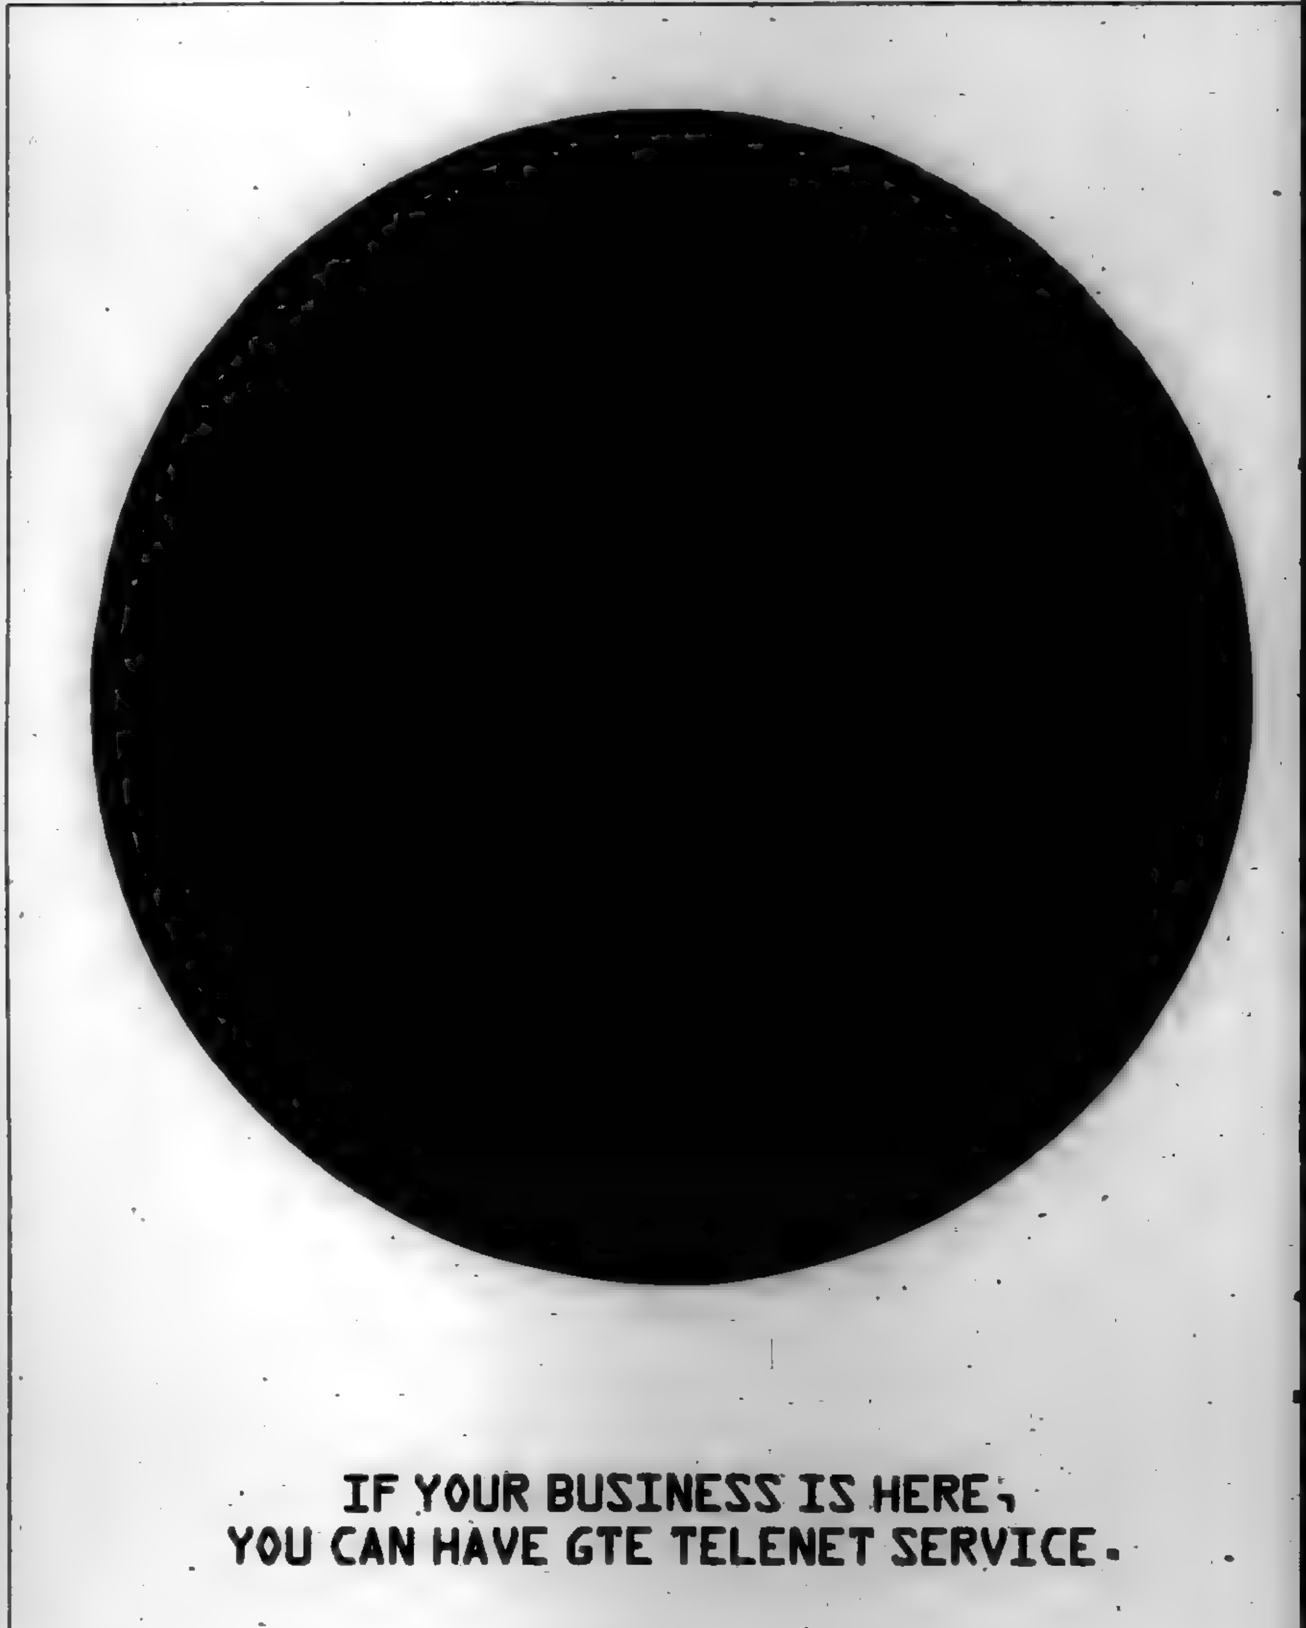
The pros and cons of having MIS gain more control of telecommunications are debatable, but telecommunications managers do agree on two things: Divestiture was good for the industry, and there is pressure on telecommunications managers to expand their knowledge beyond the technical sphere.

The pros and cons of having MIS gain more control of telecommunications are debatable. Telecommunications managers, however, do agree on two things: divestiture was good for the industry and there is pressure on telecommunications managers to expand their knowledge beyond the technical sphere.

Telecommunications managers do not wish to turn back the clock to predivestiture days. They treat the chaos of the year following AT&T's breakup as a necessary penalty to pay in the worthwhile transition to the more rewarding, albeit confusing, marketplace of competition and choice. "Where it once took a single call to get something done, it might take three or four now," Bill Coopman, manager of telecommunications at Deere & Co., Moline, Ill., explained. "In some cases there are more headaches, but when I look at today's products and services, the competitiveness and pricing structures, I get excited about it. I wouldn't want to go back."

In light of the rush of new vendors and products following divestiture, users are stressing reliability and service as top selection criteria. Companies fear an industry shakeout and look to long-term vendor stability. As Jerry Marcone, assistant vice-president of telecommunications at Crum & Forster Corp., Morristown, N.J., put it, "You can save all the money in the world, but if you can't get a person to come in and give you dial tone, voice/data integration doesn't mean a heck of a lot."

Though it could be argued that such a situation breeds an overly conservative attitude on the part of corporate telecommunications users, the figures can show the opposite. A recent survey conducted by Newton-Evans Research Co., Inc., of Ellicott City, Md., found more than 50% of the respondents planned to be less reliant on AT&T for communications services by 1987. Only 9% thought they would make more extensive use of AT&T during the next few years. So much for



IF YOUR BUSINESS IS HERE,
YOU CAN HAVE GTE TELENET SERVICE.

AT&T being the telecommunications life raft. If anything, it is fighting to retain a share of the telecommunications pie.

The flood of new technologies places the telecommunications manager at the hub of corporate life. Communications has become "sexy," and attractive, according to Kerry Overlan, director of corporate telecommunications at the United Brands Co., based in Boston. Career paths are opening wide. Telecommunications is now managerial as well as technical in scope. Many telecommunications managers are earning masters' degrees in business and degrees in finance on top of degrees in electrical engineering, programming and computer science. Many are learning the ins and outs of their businesses. Telecommunications managers no longer are expected to be just "techies." They have to know how all the pieces of an organization fit together and, more important, where telecommunications fits in. To do that, they also have to keep on top of current technology. "Telecommunications managers have to be more involved with the technology," Lucas said. "The day is past when the telecom manager relied very heavily on vendors to do analysis and understand the technology. Telecommunications managers are taking on more responsibilities in planning and operations. They just can't pass everything off on a management or maintenance contract."

In a recent speech, telecommunications consultant Richard Kuehn of RAK Associates, Cleveland, Ohio, said the era of system purchases to supplant rental costs is virtually gone for the telecommunications manager. The telecommunications manager, Kuehn stressed, must now compete within the organization for capital dollars that will provide a sufficient return on investment to justify their expenditure. Corporate production, distribution and other administrative areas will all be vying with telecommunications for scarce resource money. Telecommunications managers, like their colleagues in MIS, will have to know more than just communications; they will have to sell it to the top brass.

Muecke put it more bluntly: "Any telecommunications manager of any reasonable-size company who doesn't know financial management is saddled with a severe career disadvantage. You might not need an MBA, but you need to know financial analysis and be able to make presentations to senior management. If you can't do that, you have a problem."

Bernie Kemple, central-region manager for Tymnet, Inc., in Dallas, has seen a dramatic change in telecommunications managers in the past few years. "We would call on people [to sell networking services] and there would only be a data processing or MIS manager," he explained. "Many companies did not even have telecommunications managers, and those that did were relatively naive in their technical knowledge of communications. Now, because of the dollar volumes of these telecommunications budgets, companies are hiring more educated, credentialed people, some with MBAs on top of technical degrees. In many cases, they are becoming peers of MIS managers."

Telecommunications is demanding more from personnel, but the supply of personnel to fill telecommunications is tight. Finding and keeping qualified telecommunications people is not easy. Among corporations, heavy competition in recruiting and head-hunting is heating up, causing salaries to spiral upward. The days are probably gone when telecommunications recruits could be gradually nurtured through on-the-job training. The acceptable learning curve is growing shorter. Companies want newcomers plugged in and quickly operable. Many companies now recruit directly from the few colleges and universities offering telecommunications courses and degrees. Those that cannot find adequate personnel from outside are recruiting from within their MIS ranks, accelerating in-house training.

As telecommunications in the large Fortune 500 companies becomes complex, specialization is necessary. Like the medical profession, telecommunications sees a growing number of specialists in tariffs, PBX, T1 systems, fiber optics and network management. Coopman, who has been in telecommunications for 17 years, explained, "Back when I started, you could be a jack-of-all-trades. Now you have to begin specializing in PBX systems, in network engineering and enhancements like teleconferencing, voice mail and electronic mail. We have an expression, 'Nothing is easy anymore.' "

Maybe not easy, but life in the fast lane does seem to be more agreeable to most telecommunications managers. "As I go to seminars, I find telecommunications managers are enjoying their jobs more . . . even the telephone companies are enjoying it more," Lucas said. "Everyone complains, it's confusing, we'll make mistakes, but it's a more fascinating business to be in."

Packet Switching: What's Down the Line?

On March 1 the FCC opened the gates for the BOC to enter the packet-switching arena. That's both the good news and the bad news. New equipment, new services and new problems are arising as the players reposition in the market.

By Pamela Powers

Packet-switching has been widely promoted lately as a preferred method of transmission. Traditionally, the medium best served users that sent large amounts of asynchronous, bursty data over long distances. With improvements in technology, however, usage has evolved to encompass a variety of environments. This evolution is apparent in both sectors of the marketplace: the services sector, which includes value-added networks, and the equipment sector, which includes vendors of packet-switching nodes and packet assemblers/disassemblers.

Since the days when GTE's Telenet and Tymnet, Inc.'s Tymnet were the only players in the field, the value-added network marketplace has grown tremendously; an impressive array of fledgling vendors have now come to hawk their wares. At least 15 value-added networks of varying degrees of sophistication are currently available in the transport and manipulation of data. The veteran players retain the lion's share of the market; a large chunk of the remaining share is occupied — in descending order of penetration — by the following companies: United Computing Systems, Inc.'s Uninet; Compuserve, Inc.'s Compuserve; IBM's Information Network; ADP Network Services, Inc.'s Autonet; and AT&T Information Systems' Net 1000. (See Figure 1, Page 52.) Despite other companies' demonstrated enthusiasm for joining the fray, Tymnet and Telenet reaped profit from their ventures into the value-added net business only last year. With due respect for this caveat and the confused regulatory and competitive climate, vendors have adopted diversified approaches in order to attack niche markets.

The regulatory vagary the Federal Communications Commission (FCC) has promulgated in recent years is radically altering the texture of the value-added marketplace. On March 1, 1985, federal regulators authorized Bell operating companies' provision of asynchronous-to-X.25 protocol conversion, heralding the full-fledged entrance of Bell operating companies to the packet-switching arena. The decision enables Bell operating companies to offer asynchronous-to-X.25 conversion over their own public data networks rather than through a separate subsidiary. According to the FCC, the waiver will heighten the efficiency and availability of packet-switched services as well as contribute to the operating companies' revenues, thereby allowing cheaper local rates. This further relaxation of the rules enables Bell operating companies to stick a large finger in the packet-switching pie.

The fear that lurks behind the ruling is cross-subsidization. In the event of local packet-switching, Bell operating company-to-Bell operating company links and/or inter-local access and transport area service would encroach upon the value-added network turf by eliminating a primary source of revenue for value-added networks — access charges from the local loop to the public data network.

> **Despite some doomsday prophecies and an air of uncertainty, the value-added networks market will continue to hold its own. Bell operating companies' participation in the marketplace will complement services available across the value-added networks.**

The silver lining — and a factor that will have a more significant impact on the marketplace — is the role the Bell operating companies will play in extending value-added network service to previously untouched areas. This expansion into the local access and transport area will lure a new potential user base — small business and residential users.

In this incipient frenzy to keep their heads above water, the value-added networks are busily cleaning house. The following distinct trends have emerged:

- Increasing node intelligence. Micros have preempted minis as intelligent node processors, and protocol conversion capability is increasingly integrated into hardware, firmware and integrated chips.
- Increasing node accessibility. Value-added networks are evolving to hierarchical architectures utilizing smaller nodes in less concentrated areas and larger nodes in more heavily trafficked areas. This will permit greater geographic dispersion of the networks.
- Increasing applications specificity. More intelligence and the attempt to corner niche user markets is resulting in networks dedicated to specific applications.

Despite some doomsday prophecies and an air of uncertainty, the value-added networks market will continue to hold its own. Bell operating companies' participation in the marketplace will complement services available across the value-added networks.

Provided the FCC keeps a lid on anti-competitive behavior, the entrance of the operating companies should serve to open up new niches of potential business for value-added networks. In 1984, vendors reported earnings reflecting steady growth, with Telenet and Tymnet retaining positions at the top. The overall pattern suggests several lucrative years ahead with a five-year compound annual growth rate of 35% predicted, totaling to a year-end 1989 market of more than $1 billion.

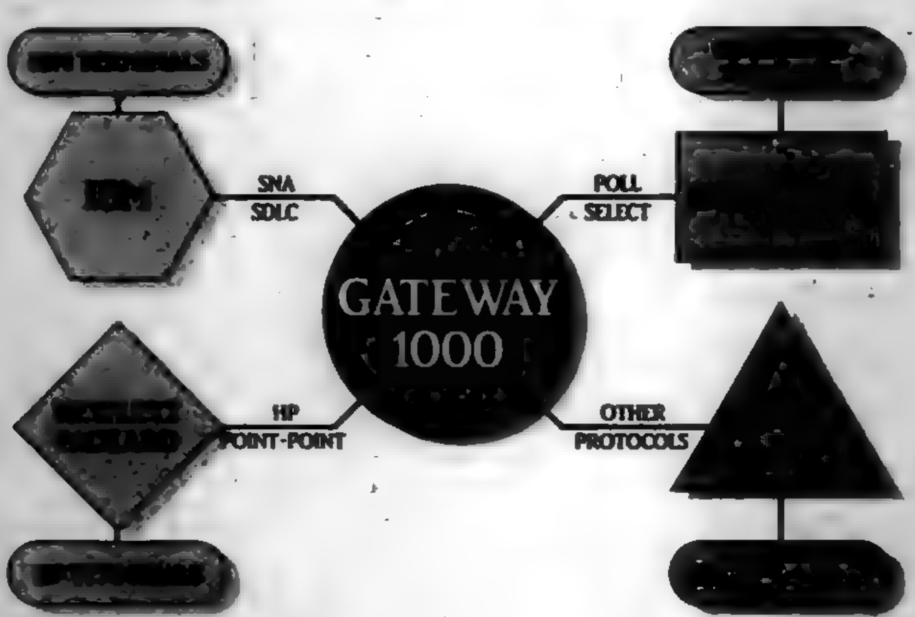
Development of new private networks, upgrading for public nets, expansion of installed base and increased use of hybrid networks as carriage to the value-added networks all contributed to a healthy climate for vendors of packet-switching systems in 1984. Systems vendors are approaching high-volume businesses more aggressively; the swing to private networks is imminent. Government, banking, transportation, retail and manufacturing concerns all have immediate needs for efficient data transport and are becoming more willing to invest initial capital to ensure reliability later. In the interim, systems vendors continue to reap handsome profits from their installed bases, whose needs continue to grow.

Finally, carriers (especially the Bell operating companies) provide a hefty chunk of the yearly shipment revenues (particularly for Northern Telecom, Inc. and Databit/Siemens Corp.). These customers own vast amounts of backbone that require continual upgrading to support density of data traffic across lines. As switch offerings continue to improve and user needs expand correspondingly, systems vendors will enjoy some healthy profits. In 1984, shipments of nodes totaled $222 million, up from $105 million in 1983. The industry can be expected to achieve a 23% compound annual growth rate, culminating in $541 million in worldwide shipments in 1989.

The packet-switching equipment market is dominated by a few heavyweights, (with GTE Telenet, Tymnet, Northern Telecom, BBN Computer Corp. and M/A-Com, Inc., at the top, ranked in descending order of penetration), yet the U.S. harbors an enormous demand that allows for a steady infiltration of new players. The domestic market still sits at the beginning of the demand curve, such

GATEWAY/1000™

A Multivendor Gateway from Forest Computer



If you have two or more different computers and you would like each terminal to access any computer, Gateway/1000 is the solution to your problem. Some of the unique features of Gateway/1000 include:

- Up to 1000 terminals supported by each Gateway/1000
- Multiple computer/multidirectional protocol conversion and terminal emulation
- Multiple simultaneous sessions to any computer from each terminal
- Multiple computer windows at each terminal
- Modular growth

For additional Gateway/1000 literature call Forest Computer at (517) 349-4700.

forest computer

1749 Hamilton Road • Post Office Box 509 • Okemos, Michigan 48864

that supply will most likely not surpass profitable bounds for years to come. Most corporations with heavy communications requirements are at the very least considering packet-switching as a viable option. Many of them are currently drawing up requests for proposals or negotiating contracts. This large base of potential users is where entrants will gain a toehold.

Entrants have found OEM arrangements to be a highly beneficial tactic. Credibility is easily gained by this route. If a switch is private-labeled by one of the hottest names in the industry, the low-visibility manufacturer will receive credit where it is due.

OEM arrangements are all the rage for other reasons as well. Given the initial capital outlay required to research, develop and market a node, it is not advisable for most companies to brave the marketplace alone. Typically, a vendor toying with the systems sales idea has the technological know-how available in-house for some of the job. The rest is most profitably arranged through a joint venture or OEM deal. Almost all vendors currently manufacturing and/or marketing packet-switching equipment expect a significant increase in OEM arrangements over the next five years.

As vendors attempt to accommodate users with all levels of communications requirements, nodes are manufactured on a sliding scale: up in capacity for the vendor with a low-end offering and vice versa. Dynapac Co., which has always targeted the low end of the market, has plans to develop a high-end switch. Northern Telecom, at the other end of the spectrum, intends to OEM a smaller switch. Increasingly, companies contemplating a private packet-switching network have some low-end requirements in areas of the country with a low concentration of traffic.

Under these circumstances, a node purchase is cost-efficient only when its minimum capacity is small. In the future, large nodes will manage traffic in central locations on the network and smaller nodes will manage less trafficked portions on the ends of the network.

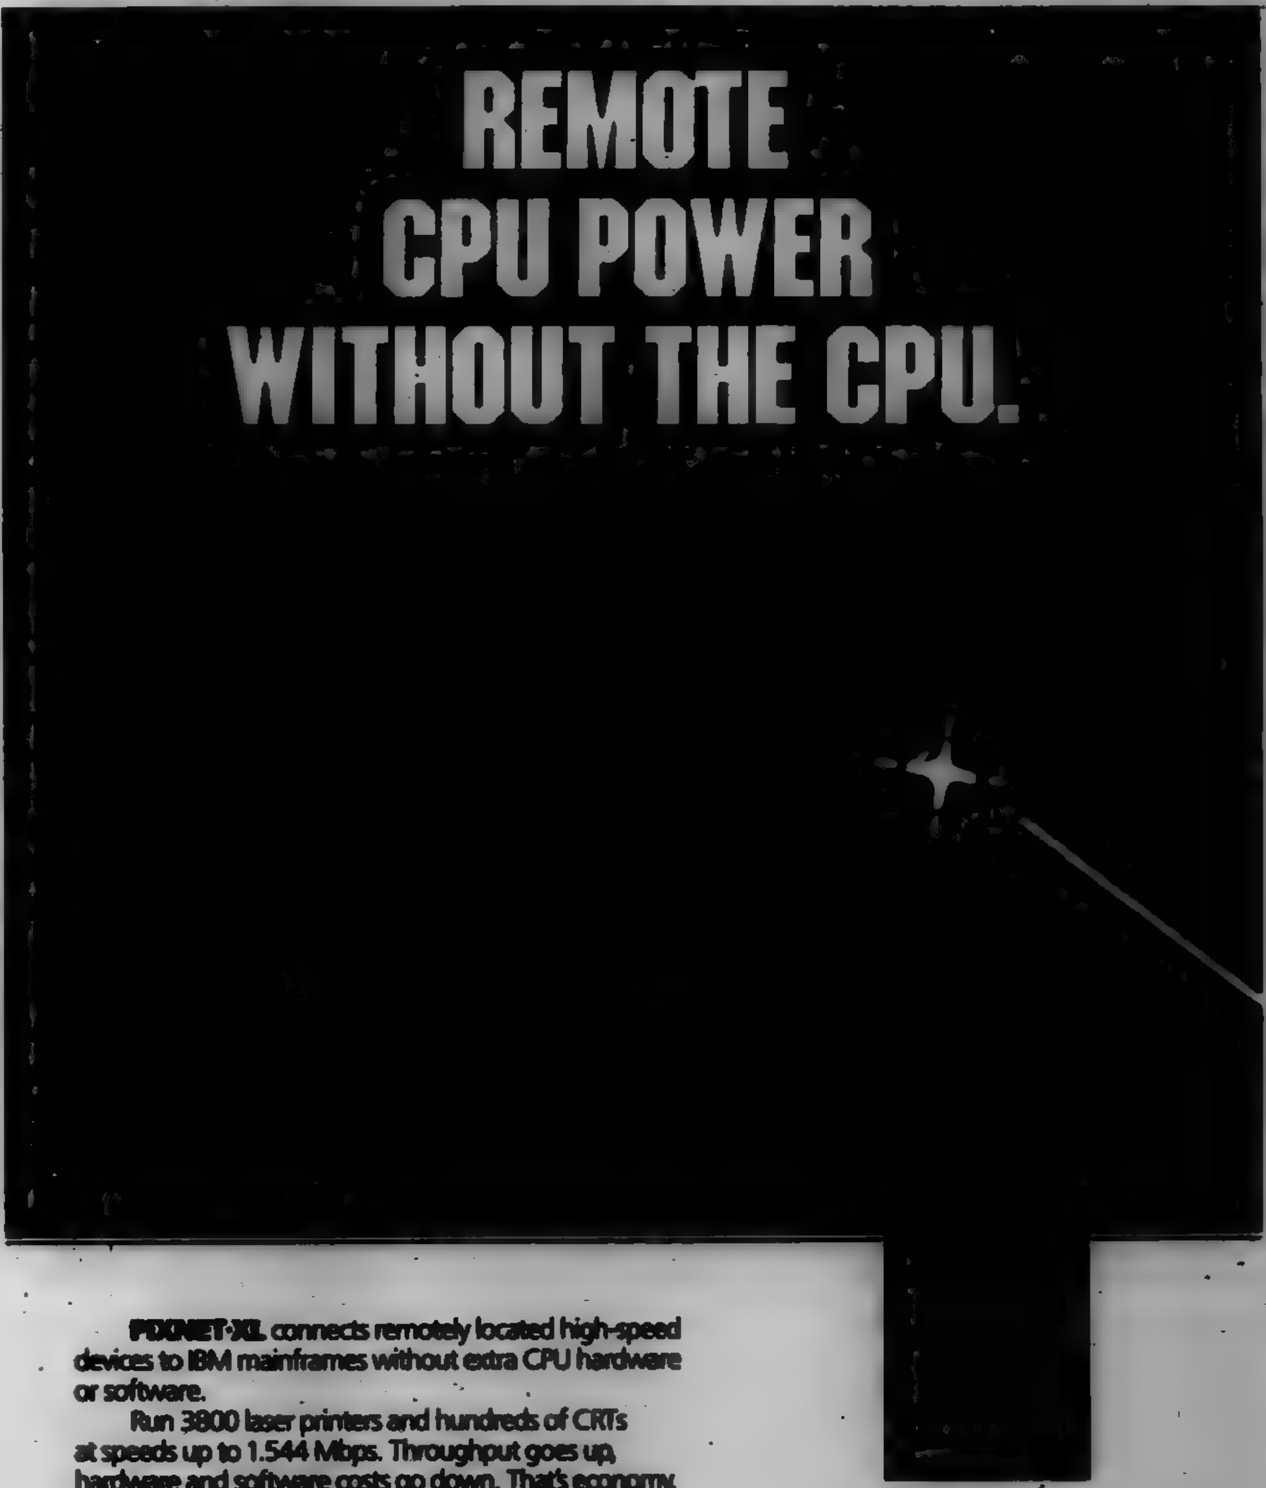
Finally, vendors have placed more emphasis on network management capabilities. For the user, the first level of concern is not the statistics collection; rather, it is fully functional diagnostics. In some proposals, the network management represents as much as half the cost of the network.

Capability will lose to cost-efficiency when stakes are that high. The year 1984 showed a maturation of network management in terms of functionality. New systems address the ever-changing status of the network by employing user-generated alarms, multilevel network security and on-line diagnostics with improved user-friendliness.

In 1984, worldwide stand-alone packet assembler/disassembler sales by U.S.-based vendors reached $34.5 million. A 30% growth year should occur in 1985, followed by a slight decline over a four-year period. Total worldwide shipments for 1989 are projected at $89.1 million. Vendor survey research conducted in March 1985 indicates Micom Systems, Inc., Dynapac and Memotec Service Corp. hold the lion's share of the packet assembler/disassembler market.

Marketing effort over the next year will be heavily concentrated on sales to the Bell operating companies. Local-area data transport (LADT) networks are about to undergo some major overhauls, and packet assemblers/disassemblers will play the largest part in the face-lift. The long-awaited improvement in local data transport and dial-up access to value-added networks will undoubtedly shore up a bountiful grab bag of new users. Everyone is clamoring for a piece of the action.

The U.S. is becoming the largest target market for packet assembler/disassembler vendors. Companies that have successfully penetrated the Canadian market — Memotec for example — are in the process of



PIXNET-XL connects remotely located high-speed devices to IBM mainframes without extra CPU hardware or software.

Run 3800 laser printers and hundreds of CRTs at speeds up to 1.544 Mbps. Throughput goes up, hardware and software costs go down. That's economy.

And to ensure ongoing network performance we cover everything from customer education to worldwide field service.

Cut the costs of remote processing with CPU speed and performance by **PIXNET-XL**. For information, write

If the space program had advanced as fast as the computer industry, this might be the view from your office.

And space stations, Martian colonies, and interstellar probes might already be commonplace. Does that sound outlandish? Then bear these facts in mind:

In 1946 ENIAC was the scientific marvel of the day. This computer weighed 30 tons, stood two stories high, covered 15,000 square feet, and cost $486,840.22 in 1946 dollars. Today a $2,000 kneetop portable can add and subtract more than 20 times faster. And, by 1990, the average digital watch will have as much computing power as ENIAC.

The collective brainpower of the computers sold in the next two years will equal that of all the computers sold from the beginning to now. Four years from now it will have doubled again.

It's hard to remember that this is science fact, not fiction. How do people keep pace with change like this? That's where we come in. We're CW Communications, Inc.—the world's largest publisher of computer-related newspapers and magazines.

Every month, over 9,000,000 people read one or more of our publications.

Nobody reaches more computer-involved people around the world than we do. And nobody covers as many markets. In the United States we publish three computer/business journals. *Micro Marketworld*, for businesses selling small computers and software. *On Communications*, the monthly publication covering the evolving communications scene. And *Computerworld*, the newsweekly for the computer community, is the largest specialized business publication of any kind in this country.

[illegible] also offer seven personal computer publications. *InfoWorld*, the personal computer weekly, is a general interest magazine for all personal computer users.

The other six are monthly magazines that concentrate on specific microcomputer sys- [illegible] the comprehensive guide to [illegible] ples, [illegible] *World*, the [illegible] magazine [illegible] magazine for TRS-80 [illegible] 0 [illegible]s. And *RUN*, the [illegible] & [illegible] 20 magazine.

And we have similar publications in every [illegible] computer market in the world. Our [illegible] than 55 periodicals [illegible] 25 countries: Argentina, Australia, Brazil, Canada, Chile, Denmark, Finland, France, Greece, India, Italy, Japan, Korea, [illegible], The Netherlands, Norway, People's Repub-lic of China, Saudi A[illegible] South Africa, Spain, [illegible] United States, [illegible]

The sooner we hear [illegible] sooner you'll hear [illegible]

Simply put, [illegible] reach your target [illegible] to reach you. Call [illegible] tion. You'll find the [illegible]

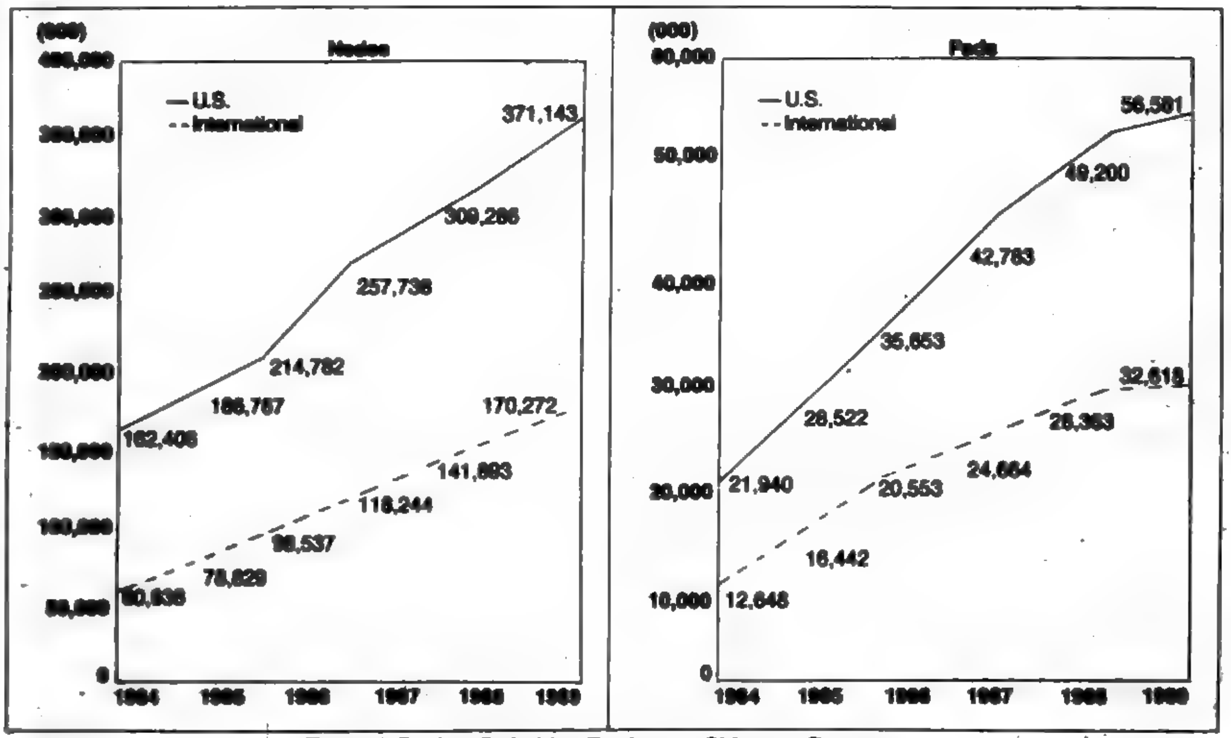

Figure 1. Packet-Switching Equipment Shipment Revenues

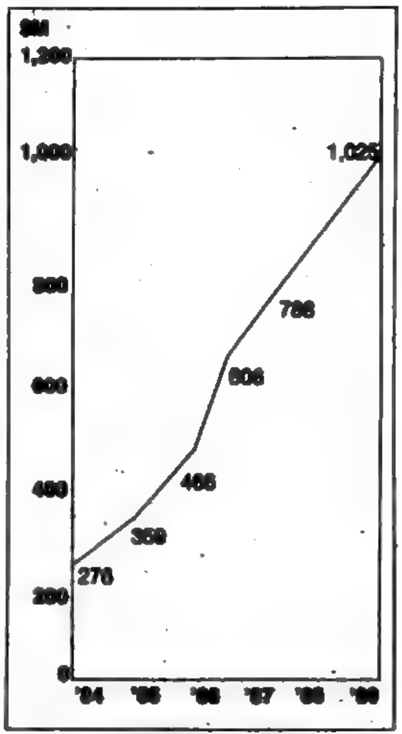

Figure 2. WAN Service Revenues

training their sales forces to attack the U.S. front. Domestically, the demand for packet switching is approaching its ripest moments. We will witness a greater division of the spoils in the near future. As the market approaches saturation (still many years off), the number of packet assembler/disassembler vendors will slack off again. Some will fail; many, as is the case with systems vendors, will develop OEM arrangements.

The X.25 gateways on wide-area networks are being introduced with increasing frequency, as are X.25/Systems Network Architecture (SNA) interfaces. The new generation of private branch exchanges (PBX) has X.25 support. AT&T's new PBX supports Levels Two and Three for X.25, for both permanent virtual circuit and virtual call modes. Northern Telecom's Meridian PBX will implement an X.25 interface, to be operable in the near future. All this suggests that access to X.25 will attain near-ubiquity within the next 10 years. As more and more data communications equipment supports this function, the packet assembler/disassembler manufacturers will inevitably fall upon leaner days.

An emerging trend that is not yet a threat to packet assembler/disassembler distribution is X.25 on a board. The protocol conversion function is now available on

Reach over 69,000 French computer professionals.

Advertise in CW Communications' French publications and sell your products directly to the thriving French computer market. According to International Data Corporation (IDC), the world's leading information industry research firm, France is the second largest market in Western Europe with DP expenditures for 1984 at more than $14.4 billion (U.S.) and a projected growth to over $30 billion (U.S.) by 1989. Our publications can help you reach all segments of the computer industry in France.

Each week, 20,000 MIS/DP executives read *Le Monde Informatique* to keep abreast of the latest developments in the industry.

Each month *OPC (PC World France)* reaches over 15,000 IBM PC users and potential buyers who are looking for the latest information on the IBM PC and compatible products.

Distributique is read each month by 8,500 computer distributors and retailing professionals. The editorial focuses on the third-party reseller market in France.

26,000 Apple computer users turn to *Golden* magazine each month for the latest information on Apple and Apple compatible computer products.

CW International Marketing Services makes advertising your products in France, and around the world, easy. We have over 50 publications in more than 25 countries. For more information on our wide range of services, complete the coupon below and mail today.

Reach over 30,000 Australian computer professionals.

Advertise in CW Communications' Australian publications and sell your products directly to Australia's thriving computer community. According to International Data Corporation (IDC), the world's leading information industry research firm, there are more than 2,300 mainframe computer systems installed in Australia and more than 333,000 computers of all types. CW Communications covers the Australian market with five important publications.

10,000 MIS/DP executives read *Computerworld Australia* each week. *Computerworld Australia* covers new products and services, current applications and industry trends. *Computerworld Australia* subscribers will also receive *On Communications*, a quarterly publication for communications professionals which helps readers plan their communications strategies. And, on the third Friday of each month, an additional 12,000 readers receive *Australian Microcomputerworld*, a supplement with in-depth information on the microcomputer industry.

Twice each month, 12,000 IBM PC owners and potential buyers turn to *Australian PC World* for timely information about IBM PCs and compatibles.

Australian *Macworld* is the only magazine in Australia for the Macintosh user community. This bi-monthly publication reaches over 12,000 owners and potential owners of the Macintosh.

CW International Marketing Services makes advertising your products in Australia, and around the world, easy. We have over 50 publications in more than 25 countries. For more information on our wide range of services, complete the coupon below and mail today.

an add-on board the user can buy with the terminal. Both Western Digital Corp. and Rockwell International Corp. manufacture X.25-on-a-chip for use with add-on boards. This offering won't penetrate the market for a while because hardware costs are too expensive to allow competitive product pricing.

Dial-up X.25, which was brought to market in 1984, will alter product functionality in the near future. On the terminal end of the network, X.25 has not caught on because synchronous interfaces are difficult to develop. X.PC and other proprietary protocols have fulfilled an intermediate need. As synchronous interfaces become better defined, X.25 will be available from terminal to network. With this new phase in communications, the procotol conversion function will become a commodity of sorts and will be available with greater frequency on modems and multiplexers. Vendors of 2,400 full-duplex modems will develop X.25 conversion capability as soon as it is feasible, and the resulting products will become significant contenders in the packet assembler/disassembler marketplace. Modem vendors will have an edge with their installed base. Although retrofitting modems for X.25 conversion does not seem a viable solution at this time, the installed base of users will go for a known evil and purchase the capability from their modem companies.

In anticipation of this emerging market, some versions of integrated packet assemblers/disassemblers and modem functions are already available. In February 1985, Wolfdata, Inc. announced its WD212-X.25 Integral Modem/PAD and its WD212-X.25 Stand-Alone Modem/PAD. The integral unit is compatible with the IBM Personal Computer, Personal Computer XT and Personal Computer AT systems and the AT&T 6300 PC. The stand-alone unit interfaces through RS-232. Both connect with Telenet's

Lower 56 Kbps rates and new KILOMUX™ Plus from General DataComm.

A winning combination you just can't beat for multiplexing data and voice.

Now that 56 Kbps digital rates have been reduced, here's the low-cost way to combine data and voice communications. New KILOMUX Plus from General DataComm.

A compact, software-controlled multiplexer for networking wideband digital services, it enables you to mix data and voice channels more economically than ever before. Its Autoframe® feature automatically establishes the most efficient use of available bandwidths. Its Time-Oriented Reconfiguration (TOR) pre-sets day and night operations.

Plus, KILOMUX is software controlled, fully protocol transparent, and expandable up to 22 channels.

Only GDC gives you all this. And more.

An integrated Mux family for flexible growth.

GDC has a complete family of multiplexers to give you a level of integration and compatibility you just can't get from anyone else.

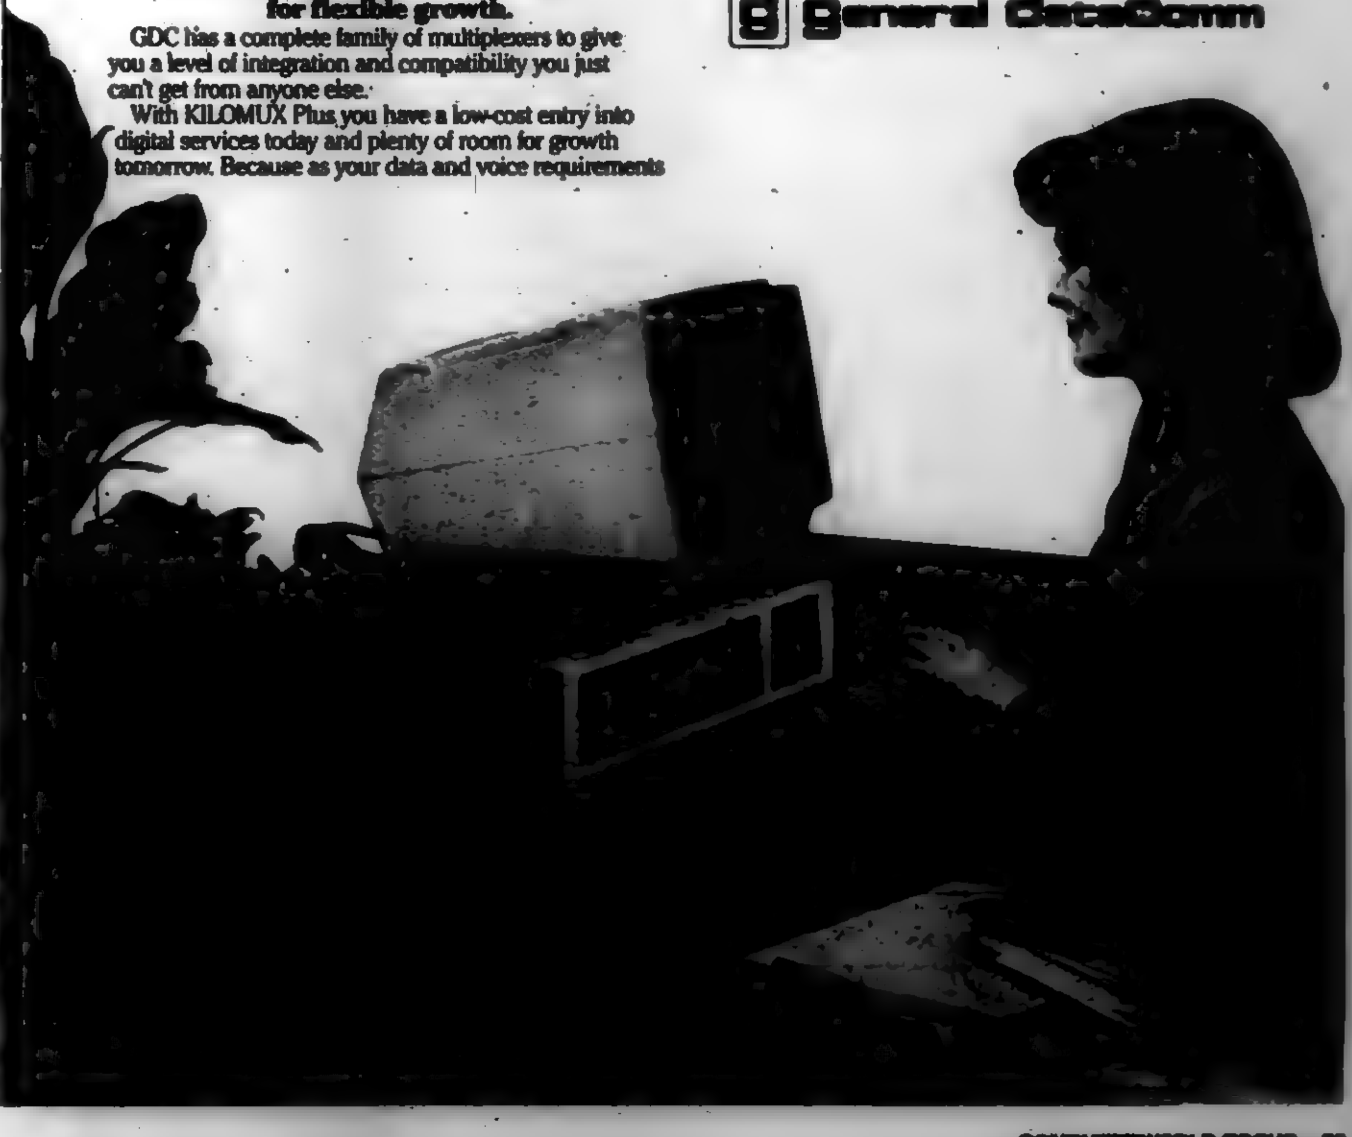
With KILOMUX Plus you have a low-cost entry into digital services today and plenty of room for growth tomorrow. Because as your data and voice requirements expand, you can add more channel cards and greater flexibility to your network with our MEGAMUX® Plus and MEGAMUX® II. All without obsoleting your initial investment in KILOMUX.

And for the ultimate in network control, our NETCON® Network Management System ties it all together to provide total surveillance, test and reconfiguration capabilities.

To find out more about the most cost-effective connection to lower 56 Kbps DDS rates—new KILOMUX Plus—call your nearest GDC dealer. Or contact our Sales Department, General DataComm, Inc., Middlebury, CT 06762-1299, (203) 574-1118.

KILOMUX Plus. The data and voice mux with the right price and performance mix.

General DataComm



recently announced dial-in service and are upgradable to X.32.

The packet assembler/disassembler function will expand as the board gets smaller. A considerable portion of the traffic out there runs on asynchronous, but IBM's 9-bit bisynchronous Synchronous Data Link Control (SDLC) will continue to grow in popularity. Over the next few years, vendors are looking to further accommodate the IBM environment. SDLC packet assemblers/disassemblers are becoming more prevalent. Asynchronous-to-X.25 and SDLC-to-X.25 will more frequently be available on the same packet assemblers/disassemblers. Multivendor compatibility is the overriding theme; better to accommodate too many than too few. Market revenues for 1984 reflect, at most, 20% bisynchronous-to-X.25, SNA/SDLC-to-X.25 packet assemblers/disassemblers. Current offerings are still comparatively expensive. The price will be driven down as more such products are brought to market (several companies are developing or looking to OEM a bisynchronous/SDLC packet assembler/disassembler).

In anticipation of lower margins a few years from now, packet assembler/disassembler manufacturers developed cheaper hardware in 1984. New products, as was the case with nodes, reflected a commitment to accommodation of all user types, from large to small. But they also boasted higher speeds and more flexible conversion capability in smaller boxes at lower list prices. The development of dial-in X.25 will significantly contribute to future customer premise equipment sales, which currently comprise only a small portion of 1984 packet assembler/disassembler shipments. Further, the Bell operating companies' asynchronous-to-X.25 conversion waiver targets them as packet assembler/disassembler users on a grand scale. Most players are repositioning to grab a piece of this emerging business.

Overall, we can safely project a bullish packet assembler/disassembler market over the five-year forecast period.

■

Powers is a senior analyst, Communications Industry Research, International Data Corp., Framingham, Mass.

Forecast Notes

☐ Dollar value of nodes and packet assemblers/disassemblers is forecasted at a decreasing growth rate over a period of five years. Price competition is expected to become stiffer in the equipment marketplace. Packet assemblers/disassemblers in particular will decrease in price for the following reasons:

- The bisynchronous packet assembler/disassembler, which is included in this forecast, is still very expensive. As more vendors introduce these products, the price will fall.
- The packet assembler/disassembler function will be available on other types of data communications equipment such as modems and add-on boards, which will force the packet assembler/disassembler price down.
- Down-sized packet assemblers/disassemblers with a lower minimum port capacity are already infiltrating the market.

☐ Market size is based on total shipments of U.S.-based vendors. Shipments represent units/systems that are newly built and sent to end users or OEM suppliers in any given year. Refurbished equipment that is reinstalled is not included in shipment estimations. In some cases, shipments are greater than the net addition to the installed base, a discrepancy that is attributed to the retirement of currently installed products.

☐ The dollar value of shipments is based on the total revenue intake from surveyed vendors over calendar year 1984. Numbers for the revenue forecast are derived by increasing this shipment base by a given percentage each year. The forecast for nodes runs at a compound annual growth rate of 19%. The stand-alone packet assembler/disassembler market will grow at 30% until 1986 and will then experience a more rapid decline due to the introduction of alternative product offerings.

☐ Dollar value of packet-switching services and equipment is represented in nominal dollars throughout the forecast.

☐ The dollar forecast for nodes reflects a depression in overall revenues during the 1984 and 1985 time period, at which point growth picks up to 20% yearly until 1989. This illustrates the fact that node prices are rapidly declining. International Data Corp. attributes this drop to the entrance of new players that can offer switches at a greatly reduced price as a result of new micro-based technology.

Some vendors still manufacture dinosaurs, which must be sold at a premium to compensate for production costs. As a result, node prices have been maintained at an artificially high level. Over the next two years, these vendors will adopt existing new technology, and node prices will drop consistently across product lines.

Following these reductions, the market will experience a small resurgence in price escalation as newcomers become established. Price/performance ratios will assume the texture of the minicomputer-based markets (for example, they will be based on improvements in technology).

The 15-Minute Data/Voice Network

Line Miser™ Converts Your Ordinary Phone System Into a Local Area Network

Now you can turn your phone system into a versatile local area network (LAN) for data and voice. It's as easy as plugging in a new telephone. And it takes about that long, too.

Gandalf's new Line Misers enable you to use your existing phone wiring for simultaneous voice and data communications. They function as limited distance modems that pass voice transparently. Simple bandwidth allocation is used to separate the data from the voice. Should your PBX fail, the data will not be affected.

Line Misers provide a fast, cost-effective means of expanding your data terminal network — up to 18,000 feet. Everywhere you have a telephone, you can quickly and easily add a terminal. It's a plug-in job — all you need is a power outlet and a phone jack. No more 4-wire dedicated data lines! Asynchronous full-duplex data rates up to 9600 bps can be handled. An option is available for synchronous operation.

What's more, all Line Misers are FCC registered. Gandalf Line Misers let you create your data-over-voice LAN in record time and at a price you can afford. Call your local Gandalf sales representative for details today.

HERSHEY'S
GETS CONNECTED

Hershey Chocolate's goal of a computer on every desk by 1990 is requiring clever space planning. Hershey has met the challenge through some innovative cabling strategies aimed at reaching that goal.

By Lee White

What do you do when your long-range directive is to put a computer on every desk, but a jungle of cables is already threatening to overtake normal operations?

Dennis McNamara is a mechanical engineer in the Technical Services Department of Hershey Chocolate Division, Hershey Foods Corp. in Hershey, Pa. McNamara's technical expertise is unquestioned, given the 14 years he has spent at Hershey, but a sideline to his chosen field is an aesthetic sensibility that was offended on a daily basis by the cable jungle.

McNamara had been reading about flat undercarpet wiring for data communications and hoped someday to try the concept in a small pilot project. About this same time, members of the executive suite at Hershey were looking at how best to couple the company's short-term and long-term growth with sophisticated future office automation plans.

Instead of a small pilot project, McNamara was given what he saw as the plum assignment of his career: 52,000 square feet of project, half of which is new construction and half of which is renovation. When finished, the space would house Hershey's entire computer center, 10 other departments and more than 270 employees.

The project began in October 1983 with an in-house study. Because so many people with varying needs were involved, input was solicited from everyone. "We surveyed people throughout and asked them what they wanted, what their needs were and what it would take to do their jobs better," McNamara said.

From the beginning, it was obvious that trying to update the wiring system using conventional methods would nullify many of the benefits anticipated from the change to a modular, open-office environment with movable partitions. The old wiring, which included floor ducts, power poles and a network of surface wiring, could no longer accommodate employee needs. Because management's goal was to place a computer terminal on every desk by 1990, the company decided to connect all electrical, communications and data processing equipment with flat, undercarpet wire.

All the engineering for the project was done with Hershey employees; McNamara was the project manager and mechanical engineer. His skills were supplemented by an in-house electrical engineering group, staff from Information Services Department and Network Control Center representatives who provided needed information regarding the telecommunications function.

As a hedge against future needs, the team elected to install three-pair telephone lines, although only one is being used at this time. The cost to install the cable with an extra two pairs was minimal compared with the cost of installing more cable some years down the road.

As a hedge against future needs, the project team elected to install three-pair telephone lines, although only one of the pairs is being used at this time. As with most facets of new construction or renovation, the cost to install the cable with an extra two pairs was minimal compared with the cost of installing more cable some years down the road. Installing spare pairs is becoming quite common, according to Chris Rottman, market manager for undercarpet wiring for AMP Products Corp., the supplier of undercarpet wiring for Hershey. "We see a lot of people putting in even four pairs, and they only use one for the electronics, which gives them two or three additional if they eventually want to go into their own PBX and carry data and voice."

The initial cost of flat wire — $1.25 to $1.50 per foot, compared with conventional round wire or twisted-pair at about 20 cents per foot — did not deter McNamara and his group, nor did it faze upper management. In order to use traditional round cable, the company would have to lay ducts beneath the floor, at a price of about $3 per foot. By directly installing flat power, telephone and data cable on the existing floor, Hershey would avoid costly disruptions to its building, half of which was occupied throughout the renovation. Faster installation time for undercarpet wiring made tight deadlines practical. The final argument for flat wire was that the company retained the option to implement new designs at any time, a strong possibility given the historical and anticipated growth rate and practicality of an open-office environment.

Work first began on the 24,000 square foot north side, formerly a warehouse for finished goods and constructed with concrete floors covered by tongue-and-groove maple flooring. This area was completely rebuilt: new rooms; new heating, ventilation and air conditioning (HVAC) system; and dropped ceiling. The walls and ceilings were insulated with 2½-inch fiberglass sound-absorbent batting, one of several measures taken during the renovation to reduce noise pollution from electronic equipment.

The engineering group decided to locate the uninterruptable power supply room on the north side and to increase its capacity from 100 to 300 kilowatts. This upgraded facility will provide 15 minutes of backup battery power to the computers in case of electrical failure. Also located on the north side were the main computer room and the network control center linking all Hershey's computers.

The undercarpet wiring was laid directly on the wooden flooring. The wiring was 3- and 5-conductor, size 12 American wire gauge flat power-cable rated at 20 amps. The 5-conductor cable provides an isolated ground to protect sensitive computer equipment. Because the cable was supplied in preshielded form, it already had the top and bottom protective polyvinyl chloride layers attached to the basic cable assembly. It could be unrolled on the floor in a single pass, following chalk lines that had been snapped on the basis of Hershey's blueprints and AMP's computer-assisted design. The copper cables are encased in laminated polyester. The .043-inch thick power cable, which is flexible and can be folded over on itself to change direction, was run from flush wall transition boxes, where it connected to the round wire conduits, to AMP's low-profile, safety seal floor fittings.

To service its electronic equipment, Hershey specified AMP's 75- and 93-ohm undercarpet data coaxial cable. Single red cables for IBM Model 3178, 3180 and 3279 CRT devices and printers and twin gray cables for Wang Laboratories, Inc. word processing workstations were run from separate wall boxes. Changes in direction could not exceed a 5-inch radius and were made by notching the cable's

A revolutionary idea takes the next logical step.

Not long ago, STEAMER revolutionized the data communications industry. And now, it's doing it again. Because now STEAMER has synchronous support.

Finally, you can handle synchronous data.

Now STEAMER gives you long awaited synchronous support. It can handle both synchronous and asynchronous data lines and reduce your line costs. All while improving your operating efficiency.

And it can do it for as little as $3500 per end for a 4 channel unit.

Our data compression is the best you can get.

STEAMER gets data compression efficiencies higher than anyone else, averaging 2.2:1 to 3.2:1. Which means increased throughput and operating efficiency for you.

Proprietary compression algorithm: the heart of the matter.

Our proprietary compression algorithm continually analyzes the incoming data stream on a port-by-port basis and compresses the most frequent strings into shorter strings. STEAMER also analyzes the data in each direction on a port-by-port basis and builds entirely independent compression tables. That ensures that you get maximum compression efficiency.

We compress the uncompressable.

We are the only ones who have done it. Now you can compress previously compressed data in synchronous applications. Even output that's gone through elementary compression routines implemented in some protocols. Plus, in some graphics applications, we get better than a 2:1 compression ratio. We can even compress object code files.

STEAMER is really the only choice for passing synchronous and asynchronous data for data communications. Call 1-800-235-5030 now and we'll tell you more about STEAMER. Because pretty soon, STEAMER will make all other stat muxes and data compression machines obsolete.

Datagram We make networks work harder.

[illegible]

supporting web. Intersections with power cables were kept to a minimum and were made only at right angles.

To complete the undercarpet wiring, Hershey used 3-pair flat telephone cable on reels and 25-pair flat cable in predetermined lengths with connections, a total of about 1,300 pairs. All rooms were completely wired before being carpeted with 18-inch Milliken and Co. tiles. Unterminated branch lines were run in anticipation of future desk and equipment placements and, with an eye to future flat wiring, even conventionally wired private offices were carpeted with modular tiles.

When the north side was ready for occupancy, employees from the south side were shifted to their new quarters. Undercarpet wiring installation on the south side was similar to that of the north, except that, after it had been cleaned, patched and leveled, the concrete floor was coated with a commercial sealer to hold down dust and improve adhesion.

Rather than abandon its floor ducts, Hershey utilized them for the telephone wiring in conjunction with the flush floor service boxes. Openings were cut in the concrete for the approximately 14-inch square by 2-inch deep service boxes, and conventional telephone wiring was pulled to them through ducts, with the aid of nearby access ports. At this point, the transition was made to flat telephone cables that extended throughout the room.

Because undercarpet wiring did not require any noisy or dirty construction, work proceeded during daytime hours without disrupting office activities. McNamara said extensive research at the beginning of the project led to the estimate of four man-hours per receptacle for installation. By the time the project was completed, the time was down to one man-hour per receptacle. "We can't put in hard wiring in an hour's time. We can't even put a receptacle in a wall in an hour. In the third phase of construction, we did around 7,000 square feet and did all the electrical work in a week's time. That's everything — data, telephone and power," McNamara enthused.

Although Hershey representatives would not divulge the actual cost of the project, McNamara said the tracking systems in place indicate costs are "right at the level of approval." And expensing the project was very difficult. "When you consider that we put dollar values together for things like the uninterruptable power supply room, the network control center, conference rooms and flat wiring, you couldn't talk to anybody who could really give you a lot of insight into [project cost]. There were so many new concepts," McNamara explained.

One of the new concepts was the Quadralong lighting system, designed by Armstrong World Industries, which allows for running computer analysis of lighting levels. Hershey settled on Steelcase, Inc. as the sole vendor for furniture and movable partitions. The choice of Steelcase was a good one, McNamara explained, primarily because of Steelcase's accommodation to Hershey's methods of construction. At one point, Steelcase had 17 tractor-trailer loads of furniture delivered to the site, McNamara said. "Right in order, everything in [each trailer] just the way it's supposed to go in. Talk about coordination. It was phenomenal the way they brought it in."

Perhaps the most amazing piece of the whole project was the short amount of time that elapsed from beginning to end. McNamara got funding approval in the spring of 1984, work began in July and the entire project was completed by June 1985.

Perhaps the most amazing piece of the whole project was the short amount of time that elapsed from beginning to end. McNamara got funding approval in the spring of 1984, work began in July and the entire project was completed by June 1985. McNamara attributed the speed of the process to the project team — one person from purchasing, the building office manager, an industrial engineer, information systems representatives, two full-time construction coordinators and telecommunications specialists.

In addition to in-house personnel, vendors played an important role. After construction began, meetings were held every two weeks with the foreman of the outside construction firm and the electrical foreman. Also on the project team were in-house regulatory affairs people; safety officers; and electrical, mechanical and HVAC-type support staff. All these people went over power requirements, reestablished distribution panels, arranged for new lighting and power panels and brought the 1,300-pair phone system up to the IBM 3083 mainframe computer.

"Two ads in Computerworld Focus flooded us with inquiries on our new micro product, EnerConnect."

EnerConnect is the second major micro product from Enertronics, developers of the successful EnerGraphics package. As the ad for EnerConnect says, it is ". . . the first software package that puts mainframe graphics capability into the hands of anyone with an IBM PC . . . or 3270 PC."

When it came time to announce EnerConnect, Randy Andes decided to use *Information Week, Business Week,* and *Computerworld Focus.* As Randy puts it, ". . . we knew *Computerworld* reached the people we need to talk to from past ads for EnerGraphics, and we decided to test *Focus* because, as the name says, each issue focuses on a topic. So, we could select an appropriate editorial environment."

The results? "*Computerworld Focus* has produced the most response of any of the publications used and, by far, the best response. In fact, total response (via the 800 number) has far exceeded expectations. We further intend to continue to tie into *Computerworld's* editorial calendar where appropriate."

The moral? Well focused advertising in a well focused medium will produce the best results every time.

Call your *Computerworld* advertising representative for more details on upcoming issues of *Computerworld Focus.*

Randy T. Andes, Director of Marketing, Enertronics Research, Inc.; St. Louis, Missouri.

COMPUTERWORLD FOCUS

Boston: (617) 879-0700/Chicago: (312) 827-4433/New York: (201) 967-1350/Atlanta: (404) 394-0758/Dallas: (214) 991-8366/San Francisco: (415) 421-7330/Los Angeles: (714) 261-1230

During the period of construction, staff who previously occupied the floor were moved to other areas for short periods of time. The one area that stayed put was the computer room, according to Bruce Dieffenbach, director of the Information Services Department. Other systems personnel were moved, but arrangements were made for temporary dial-up capabilities.

> **The computer people experienced no downtime and were never out of the system during the day. Cutovers were arranged to occur on a Sunday, when scheduled computer operations were finished.**

The course of construction did not always run smoothly. Problems abounded, according to McNamara, but the team took great pains to see employees were not affected. In the first phase — the north side ex-warehouse area — McNamara requested that AMP supply the wiring in predetermined lengths with standard connectors. When installation began, he found last-minute routing adjustments resulted in excess cable that had to be trimmed and reterminated. Because this wasted great amounts of wire, McNamara decided to purchase reels of cable for the south side and terminate it to the exact lengths required.

The biggest problem McNamara and his team faced was the possibility that something very big could go wrong. They worried about equipment deliveries, scheduling, "just the day-to-day routines of having everybody provide services and equipment they had to provide to keep everyone going," McNamara said. A persistent fear was that an accident could shut down the entire computer system. "We had to make tie-ins to the uninterruptable power supply room which are also tied into the halon system," McNamara explained. If a mistake were made during the construction operation, the halon system could be tripped, which, as part of the normal shutdown procedure, would in turn trip and throw the equipment down.

Dieffenbach shared McNamara's fears. "We were ready for all kinds of problems. We thought surely something was going to jump up and bite us, but it never did." Dieffenbach attributed the success to McNamara and the project team. The computer people experienced no downtime and were never out of the system during the day. Cutovers were arranged to occur on a Sunday, when scheduled computer operations were finished. "[The project team] would make a cutover from the old power system to the new power system and cut over to new transformers and new telephones — all that was done so it didn't interrupt our operations. It was probably a burden to schedule, but it was no problem for us. We had no disruptions. But [McNamara] used to have jet black hair before this job started, and he was 6 feet tall, too, before we beat on him," Dieffenbach laughed.

Dieffenbach was also pleased with the final results of the flat wire system, but tempered his enthusiasm with the caveat that flat wire could not work in all installations. At Hershey, the development staff, the computer room and the room where all experimental equipment for system development and printer and terminal trials are made are connected with flat wire, but the average run is 30 to 40 feet. AMP's Rottman explained that short runs are safe runs for flat wire and added that with flat wire, "the attenuation rate is about three times as great as with normal round wire." There are systems staff members who are in buildings other than that which houses the mainframes, Dieffenbach said, but their terminals are connected to the mainframe via short-distance modems, local dial-up, dedicated phone lines and control units in their locations.

Whether the flat wire concept will be carried out in other parts of the Hershey facility remains to be seen, but the renovation project has attained high visibility in the company. According to McNamara, the anticipation level as the project neared completion was very high. "There was a buzz going on. People were really excited about moving into something they were going to appreciate. I think it has been very well accepted by the employees," McNamara said. But he added that it couldn't have been done without the top-down support from management. "Nothing was done 50% or 75%. What you see is representative of what people's needs were, and they got it."

Down-time?
Up-time.
In Time.
Every Time.

Downtime. Uptime. In Time. Every Time. Six words that tell the story of quality service. Told by TRW, the company that lives by these words. Our principal business is the expert maintenance and repair of your system's hardware. Expertise you can rely on to reverse downtime to uptime. In time. Every time.

Because we maintain a wide variety of sophisticated electronic equipment, TRW is the only source you may need to keep your hardware performing at peak efficiency.

1000 IBM PC's in Boston. 280 Altos systems in Detroit. An IBM Mainframe in New York City connected to an assortment of TeleVideo, Esprit and Wyse terminals in 30 different sites and two different cities. Plus 5 Dataproducts printers in L.A. We can do it all.

Service for over 50 brands . . . and growing. In applications that are reshaping American business, industry and government. Office Automation. Banking Systems. ATMs. Telecommunications. Networking. Point-of-Sale Systems. Medical Electronics.

Whatever your requirements, chances are there is a TRW Service Program available that will more than satisfy your expectations. And fit very comfortably within your budget. Today. Tomorrow. Next month. Next year.

There's more to our story. To get the facts, call 1-800-257-7464. Today! (In New Jersey, call 201-575-7110 (Ext. 100).

Service solutions for tomorrow: They're taking shape at a company called TRW.

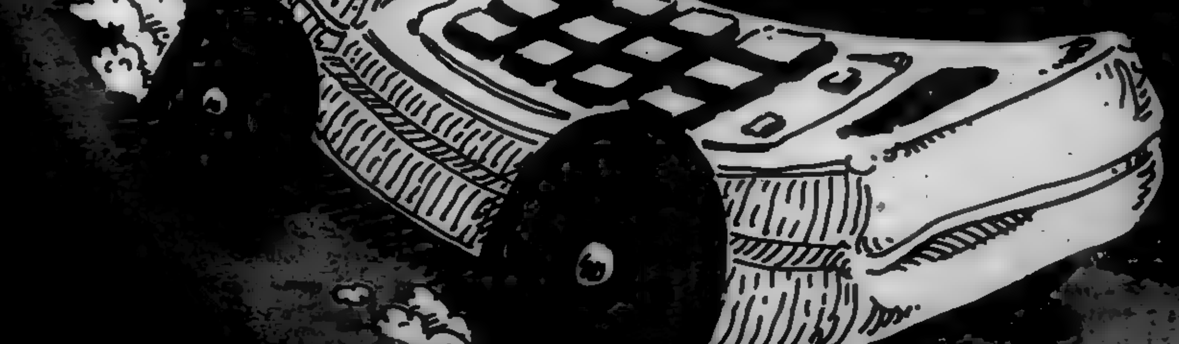
TRW Nationwide Service From A Company Called TRW

©TRW Inc. 1985 — TRW is the name and mark of TRW Inc.



will be a key issue in all facets of communications.

What form will this portable and mobile communications system take? Cellular telephones in automobiles constitute an intriguing and interesting beginning, but car telephones simply are not the wave of the future many would like you to believe. The form that telecommunications device will take presents interesting possibilities. Systems that were gizmos yesterday are becoming feasible and practical. Telephones in briefcases, for example, are becoming lighter, smaller and less expensive. And, if the evolution of the electronic calculator from 1970 to 1976 is any example, we can anticipate that these telephone sets will become increasingly more portable, which will lead to our taking them anywhere we go, not just in our cars.

These roaming telephones in turn begin to pave the way for Dick Tracy-type wristwatch radios, which — believe it or not — will be with us in a short time. The actual devices will be utilized for cellular services and are only as limited as our design and marketing imagination.

Applications for cellular services appear to be endless. Cellular services for bypass? Why not? In essence, that's already happening with the nine-wire line carriers. Cellular service in lieu of terrestrial services for remote costly service areas? Of course. This becomes a strength of the operating company.

But operating company or not, industry experts agree the future for cellular service takes us into areas far passing our present realm of imagination. George Blasingame, general manager of Cellular One in Memphis, gave the following description of the future scenario: "Any person, business or resident will have a personal communicator. When you walk out of your home, your personal communicator will be in your pocket. In your automobile, you will plug it into a cassette-type device that will operate on a hands-free, voice-actuated process. Data communications will be built into a screen in the car. The personal communicator is charged as it is used.

"The personal communicator is popped into your desk module upon arrival at work. During this process, it works behind the PBX attached to the cellular network.

"After work, the personal communicator accompanies you for nine holes of golf or a couple of hours on the tennis court. At the end of the day, the personal communicator is popped into a charger by your bed, and during that time it is charged as well as utilized for your bedside telephone," Blasingame said.

Comparing technology of cellular services today with technology a couple of years from now is similar to comparing an IBM 360 with today's personal computer. Technology enhancements that will lead to this future world of communications are surprising, for they will not be memory storage enhancements, improvements in chips and integrated circuits or improvements in networking itself. The key will be battery technology, and estimates state that AT&T is now spending well into the tens of millions of dollars on improving current battery technology.

The good news of all the activity in the area of cellular services will be better service in remote locations; less expensive service for rural areas; executive and senior management mobility; opportunities for handicapped and severely disabled people to work from home; more flexibility in business locations; and new products, concepts, technologies and jobs.

The bad news? More interruptions. More people will be able to find you. More ways for people to know where you are — remember, the computer has to know where you are to place the call. More invasions of privacy. More regulations. More decisions. But most important of all, the opportunity to get a wrist telephone with a little antenna like Dick Tracy's.

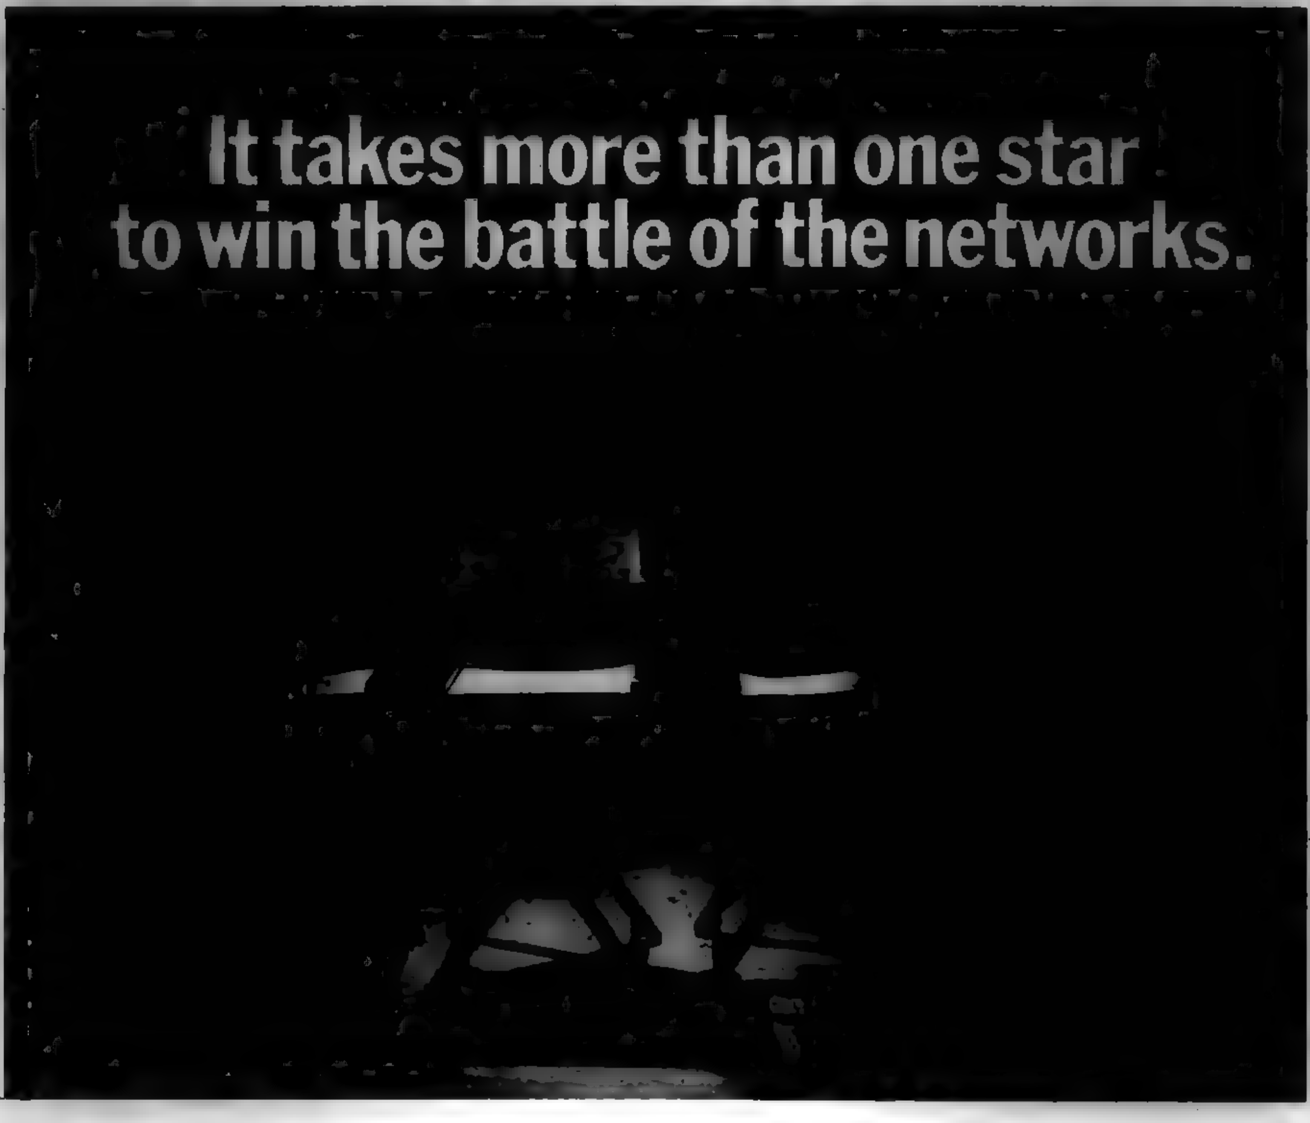
Horrell is president of Mitchell and Horrell, Inc., a telecommunications consulting firm in Memphis, Tenn.



It takes more than one star
to win the battle of the networks.

At Novell, we've often wondered why other local area network makers each offer a single LAN system that tries to serve the needs of everyone. The idea seems foreign to us.

That's why Novell offers four complete LAN systems. Every one features the high performance and security of NetWare. Each lets you link multiple LANs together using NetWare Bridges. All four are fully compatible with DOS 3.1, so you can run any application written for the IBM PC Network. And each offers its own strengths to meet your networking needs.

NetWare/S-Net features optimum speed and performance, the extra-large disk capacity of the powerful Motorola MC68000 microprocessor, best overall performance as workstations or workload increase, and a star configuration.

NetWare/ProNET features excellent performance, Proteon's highly rated ProNET interface card, multiple transmission media options, and a token-passing star-shaped ring configuration.

NetWare/ARCNET features high performance, the token-passing technology of Standard Microsystems' ARCNET controller, and the proven reliability of a "string of stars" configuration.

NetWare/G-Net features fast, reliable performance, moderate start-up costs, Gateway Communications' G–Net card, and a single trunk cable configuration.

The Four-Star Network.

With four complete LAN systems, Novell is ready to network your company no matter what your unique needs may be. Instead of trying to fit your company to someone else's LAN, let Novell show you a LAN that fits your company.

For more information, call us at 1-800-LANKIND, or see your local network dealer.

The rivalry between local-area networks and private branch exchanges has heated up as the need for efficient and cost-effective communications grows more urgent. Here are some pointers that will help your organization win this round.

By Stuart Wecker

Local-area networks and digital private branch exchanges (PBX) are the focal points of current communication network developments. Local-area nets provide efficient mechanisms for interconnecting computers, terminals, word processors, facsimile and other systems within a local environment. PBX add data communication capabilities to the voice system for interconnecting computer equipment and digital devices. We will focus on the digital PBX and the integration of voice and data communications within a common switching system framework.

Information applications can be seen to consist of four components: the user component, providing the stimulus to the application and the recipient of the response; the application program, the information processing unit; the file system, the storage unit component for temporary and permanent information storage; and the communication network, connecting the other three components and providing the necessary communication paths for information exchanges. This model applies to both data and voice communications.

The communication network can be totally local or it can be nationwide or worldwide. If the capacity of the network is sufficient to carry the required traffic among the other three components and provide the proper response characteristics, the user will be totally unaware of whether the application and the file system are local or thousands of miles away.

Integration of voice and data communications means the unification or sharing of components or information. Integration is, therefore, an individual perspective as viewed from each of the four components. There are four possible alternative definitions of voice/data integration. At the user component, integration is the coupling of the voice and data user components (for example, a terminal device with voice and data capabilities). This integrated device can provide services such as Rolodex dialing, where a user data base of names and phone numbers is brought to the screen. When the cursor is placed over the correct location, a call button is pushed and the phone number is dialed. Typical examples of devices with such capabilities are the Displayphone from Northern Telecom, Inc. and the Cypress terminal from IBM/Rolm Corp. It is possible to build such an integrated terminal with voice and data capabilities, yet have this device connected to two separate networks — a data network and a voice network. It still appears to the user as providing an integrated voice and data service. The integration is brought together at the user level.

Integration at the application component could be via an electronic mail application with voice and data mail segments. An editor for this system would have the capability of editing both the data component of the document and the voice component of the document. Such a system would provide information in its most appropriate format to the mail user. Similarly, the third perspective for integration is at the file system component, where a common storage file subsystem could be used for both voice and data components.

The last component for integration is at the communication network itself. Information can be sent from voice telephone instruments to other voice instruments and from terminals to host computers and filing systems over a common network structure. This integrated network is currently the domain of the data/voice PBX, integrating voice and data transport services within a common network. The public version of this integration will be the integrated services digital network (ISDN) providing worldwide integrated data and voice services. A combination of these public and private networks will then lead to a total integrated network where the local integrated voice/data PBX, local-area networks, terminals, applications, host computers and file storage subsystems can all be interconnected on a global basis (see Figure 1).

What are the advantages of integrated voice and data communications over separate network systems and services? Integration at the user, application and file system components provides a flexible set of user information services. That is, information can be presented in its most appropriate format.

Integration at the communication network is desirable for reasons other than for user services. An integrated network is economical due to the sharing of channels and switching system capabilities. This sharing results in reduced installation and maintenance costs for the network compared with two separate networks. By integrating two networks into one, the management and maintenance of the combined network should only cost about as much or only slightly more than that of one of the individual networks. Integration of the networks also increases its data connectivity — the ability to access digital data components at any location where there is a telephone instrument. PBX offer integrated voice and data communications with high function network management features. These include the ability to account for the usage of the PBX for information transfer and the ability to divide users into various service classes restricting their service to specific connectivity and features within the system.

Another benefit of an integrated voice/data PBX is the eventual interconnection to the worldwide ISDN mentioned above. Over the next few years, the major PBX vendors will be building interfaces to this network.

The purpose of a communication network is to provide an information path among communicating resources. These resources may be computer terminals, host computers, file servers and other digital communication devices. The service requirements of each resource pair conversation vary with the requirements of the specific application. What is important is that the network must satisfy the service requirements of its applications and its users. Possible network service requirements are:

- Performance (throughput, delay).
- Data (integrity, block size).
- Flow (sequencing, control, guarantees, uniformity).
- Connectivity (addressing, establishment).
- Reliability and Availability (failure modes).
- Maintainability (failure isolation, removal, testing).
- User Interface (circuit, transaction, burstiness, rate).
- Information Mode (analog, digital).

An examination of a range of information applications shows that the service requirements of each application differ. The purpose of a network is to meet as broad a range of service requirements as possible to serve the needs of a wide range of users.

PBX have evolved from an analog-based technology to a digital-based technology. This has been due in large part to the reduced cost of integrated digital circuits, making it more economical to build a digital PBX than an analog one. The development of the digital PBX has also been driven by the need for stored program control to manage the ever-increasing array of PBX user features. The evolution has additionally been motivated by the move to digital transmission technology, resulting in the ability to transport more information over the same pair of wires.

Figure 1. Total Integration

The newer digital PBX are designed to provide integrated voice/data services, thus expanding their domain from voice-only services to digital data services as well. Prior to integrated digital PBX, data could always be sent over a voice-only network by making the data appear as a voice communication (see Figure 2). Modems convert the digital bit stream into an analog representation compatible with the frequency characteristics of the human voice, thus enabling the data to be transmitted through the analog network. The major drawbacks are the limitation on the maximum speed of transmission and the relatively high cost of the modems.

The alternative is to transform voice into a digital representation. In a digital PBX, the analog voice signal is converted into a digital form by representing the amplitude of the analog signal at periodic sampling points by the corresponding digital value. In computer terminology, this is an A to D conversion. The telephone industry uses the term pulse code modulation (PCM) for this signaling conversion. If the signal is sampled frequently enough and a fine enough representation for the amplitude of the signal is used, the digital values can be transmitted over the network and at the receiving side of the network converted back into their corresponding analog voltages. Using smoothing circuits, the original analog signal will then be re-created.

The standard digital representation used in the U.S. telephone PCM system is an 8-bit value, the high-order bit being a sign bit and the low-order 7 bits being the value of the signal on a logarithmic-type scale. The signal must be sampled frequently enough to retain all of its information.

Information theory tells us this sampling rate must be at least twice the highest frequency of the signal. It is assumed that voice in the analog system is bandwidth limited to be between 300 and 3,400 Hz. Sampling this signal at 8,000 sample/sec is, therefore, a safe value. This rate times 8 bit/sample results in the standard bit rate of 64K bit/sec for each voice pathway. A two-way conversation requires two 64K-bit/sec paths, one in each direction. Digital PBX create digital conversation paths that have the capacity for transporting 64K-bit/sec streams, specifically divided as 8,000 samples of 8 bits each. Because digital data is also typically in the format of 8-bit units (bytes), it is a relatively straightforward task to use a digital PBX that can transport digitized voice and have it transport digital data as well.

Contrasting the service requirements of digitized voice and typical digital data transmission, the timing requirements of a digitized voice transmission are significantly more stringent than those of an interactive or transaction-based data transmission. The voice requires a 64K-bit/sec constant bandwidth and delay path, an 8-bit sample arriving every 125 microseconds. Interactive terminal and transaction base traffic are significantly less stringent in both their bandwidth and delay requirements. For this reason, a PBX designed to meet the timing characteristics of voice can easily meet the requirements of most digital data transmissions.

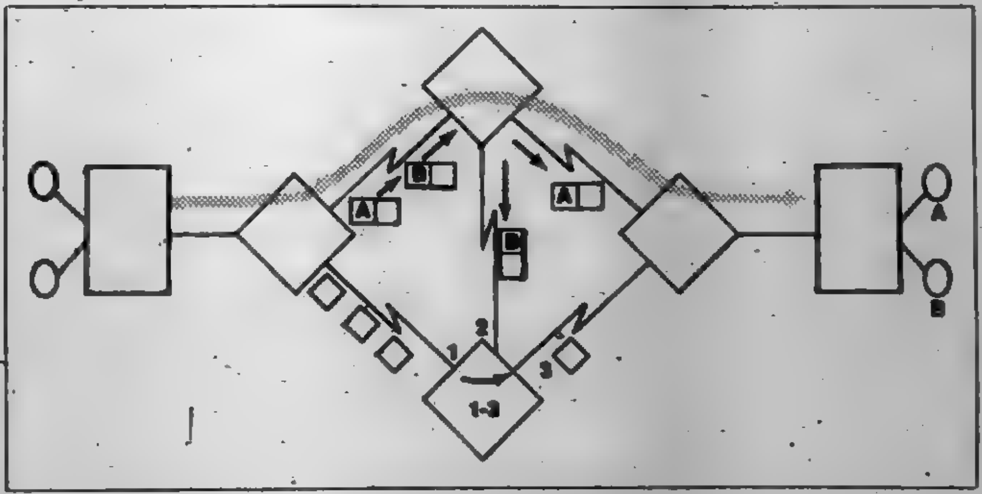

Figure 3. Switching

Switching is the heart of a communication network. It is the component that transfers information arriving at an entry point or port in the network to an exit port. Each switching unit in the network performs this transfer from incoming to outgoing ports. If the communication network consists of more than one switching unit — switching nodes connected together with intermediate channels — a routing algorithm is required above the switching technology to build paths through the switches, creating paths between the endpoints of the network. Routing is, thus, a cooperative execution by all of the distributed switches to create common paths.

Switching requires identification of the incoming information to determine to which port or channel it should be sent out. In circuit-switching technology, channels are dedicated to conversation paths and the incoming physical channel or port address is used to identify the information. In packet-switching technology, channels are shared among conversation paths and information is switched based on an address that is part of each information block — a data item address. Circuit switching is used by digital PBX. Packet switching is used by both local-area networks and wide-area data networks (see Figure 3). In circuit switching (in the lower part of the figure), data blocks arriving on Channel 1 are switched out to Channel 3 through the switching unit, independent of information contained in the incoming data blocks. The upper part of the figure shows packet switching, where individual data blocks are preceded by an addresis. The switching entity uses the address to decide on which outgoing channel to send the information.

Circuit switching implies dedication of channels to specific information streams; packet switching allows channels to be shared dynamically, block by block, among a number of information streams. These two technologies have evolved based on the specific flow characteristics of voice and data. Digitized voice transmission is a smooth, steady flow of information, well-suited to circuit switching. Interactive data traffic is a flow of bursty blocks of information, well-suited to the channel sharing of packet switching. In typical circuit switching, a dedicated path is formed from dedicated channels and switching elements, the path being reserved for the duration of the connection. The path is of fixed bandwidth and delay, and unused bandwidth cannot be shared with other users. It is efficient for constant flow traffic as in digitized voice transmission. Packet switching creates a path formed from shared channels and switching elements. There are ususally no fixed paths through the network; each packet is independently routed according to a routing algorithm. Channels are, therefore, shared and bandwidth dynamically allocated on demand. The routing algorithm can create static or fixed routes or be adaptive — changing routes when changes occur in the network topology. Bursty traffic over package switching networks results in a network with high component utilization and efficiency. For smooth flow traffic, circuit switching is highly efficient.

In the typical local-area network approach to data using packet-switching technology, information from one network interface unit (NIU) is sent to another NIU by creating an information block with the appropriate destination and source addresses preceding the data and sending it out on the media. This information is received by all NIU and processed by the one to whom the destination address corresponds. Different users at different points in time can transmit blocks on the media, interleaving conversations among a variety of users. The media in the local-area net is performing the packet-switching function. When many user conversations are active, virtual circuits — a higher level concept — keeps one conversation path separate from another by creating a second level of addressing within the data field. This address multiplexes the conversation of each user into the single stream between NIU. The PBX approach to voice uses circuit-switching technology. When one telephone wishes to create a conversation path to another telephone, the PBX assigns a fixed portion of its bandwidth to that conversation, two 64K-bit/sec pathways. These paths are dedicated to the digitized voice conversation between the users for that conversation.

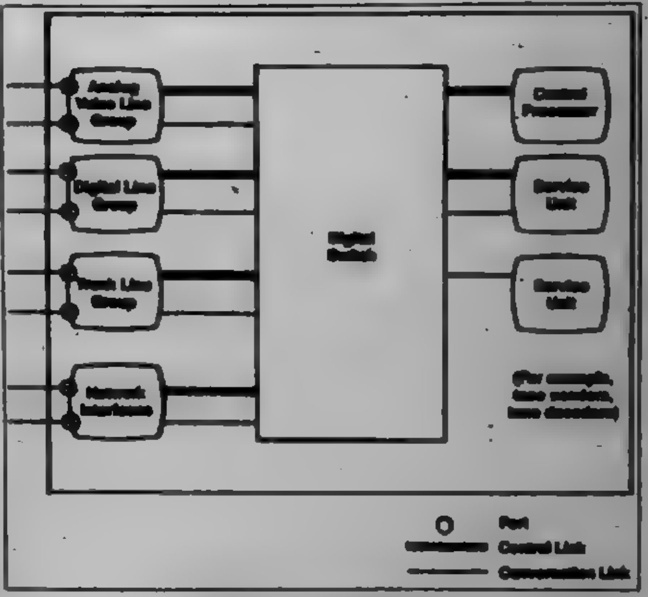

Figure 4. Voice/Data PBX

It is important economically to strike a balance between service requirements and cost of the switching system. Usually you would optimize the switching system technology around the service requirements of the highest usage application with the constraint that the service requirements of all the users of the switching system must be met. Generally, voice has more stringent service requirements than data. Most current digital PBX can easily support the service requirements of both voice and data. The worst consequence of sending bursty data over a circuit switch network is that some of the bandwidth of the dedicated conversation path will be wasted. On the other hand, voice cannot usually be sent over packet networks. The packet network would have to be designed to meet the stringent delay characteristics of the voice and be structured to economically transmit the small blocks of digitized voice information. Generally, it is not economical or efficient to use packet technology for the smooth voice transmission. As a result, there is a movement toward the use of digital PBX to carry data.

There is no reverse movement with local-area networks adding voice.

Integrating voice and data communications through a common digital PBX is motivated by the sharing of the communication system, within both the wiring structure and the switching electronics. This sharing results in lower installation and maintenance costs for the integrated network. In addition, the capacity of the switch can be shared between the data and the voice usage. Digital PBX, based on circuit switch technology, provide privacy of data on each user conversation path compared with the open nature of the shared concept in local-area nets. Digital PBX also offer high-function centralized network management, and some offer very high bandwidth digital data transmission over inexpensive twisted-pair wiring.

Figure 4 on Page 63 shows the typical architecture of a voice/data PBX. The digital switch component creates 64K-bit/sec circuit switch pathways between the users or ports attached to the switch. Attached to these ports are a set of interface units that transform incoming and outgoing information into the standard 64K-bit/sec internal format and local-service units that serve as internal end points of circuits. The interface units include standard analog voice line groups interfacing standard analog telephone sets, digital line groups interfacing digital telephone sets and trunk line groups interfacing to the public telephone network. The analog voice line interfaces provide the digitized sampling and the creation of the 64K-bit/sec stream from the incoming analog voice. The digital interfaces manage the incoming voice, data and control information from the new digital telephone sets. Trunk group interfaces provide an interface to the public telephone carrier central office using standard ground start or loop start trunks. The most recent developments in interfaces have been in network interfaces that provide the transformation between external network standards and the internal digital switch. The most common interfaces are to X.25 and IBM Systems Network Architecture (SNA) nets. The service units are internal information sources and sinks and provide services such as tone decoding, conference bridges and various signaling tones for use by the other interfaces.

The switch operates on the principle of creating 64K-bit/sec circuit switch paths in the format of 8,000 samples of 8 bit/sample. It does this by creating conversation paths between the interfaces and/or service units attached to the switch. When a conversation path has been established, each 8-bit sample arriving at the digital switch on an incoming port in the conversation path is switched to an outgoing port. This switching involves information movement in space and time domains. In space switching, the 8 bits of information are physically moved from the incoming port on the digital switch to the outgoing port. In time, switching the 8-bit samples may arrive at the incoming port at an instant out of time synchronization with those to be sent out on the outgoing port. Time delays are needed to compensate.

The time switching is managed via buffering, where the incoming stream is buffered in intermediate 8-bit buffers until the proper time arrives for them to be sent to the outgoing interface unit. The buffers create a time independence through switch. Space switching is typically handled via a high-speed time slotted backplane bus, where the 8 bits of information are physically sent from an incoming interface to the outgoing interface through time slot positions on the bus. In some cases, buffering and time synchronization is managed within the interfaces. In other cases, an intermediate memory is added to the bus. Each vendor has a unique approach to implementating voice and data integration.

In the Oct. 16 issue of Computerworld Focus, *Wecker will discuss wiring and planning, the coexistance of PBX and local nets and current offerings.*

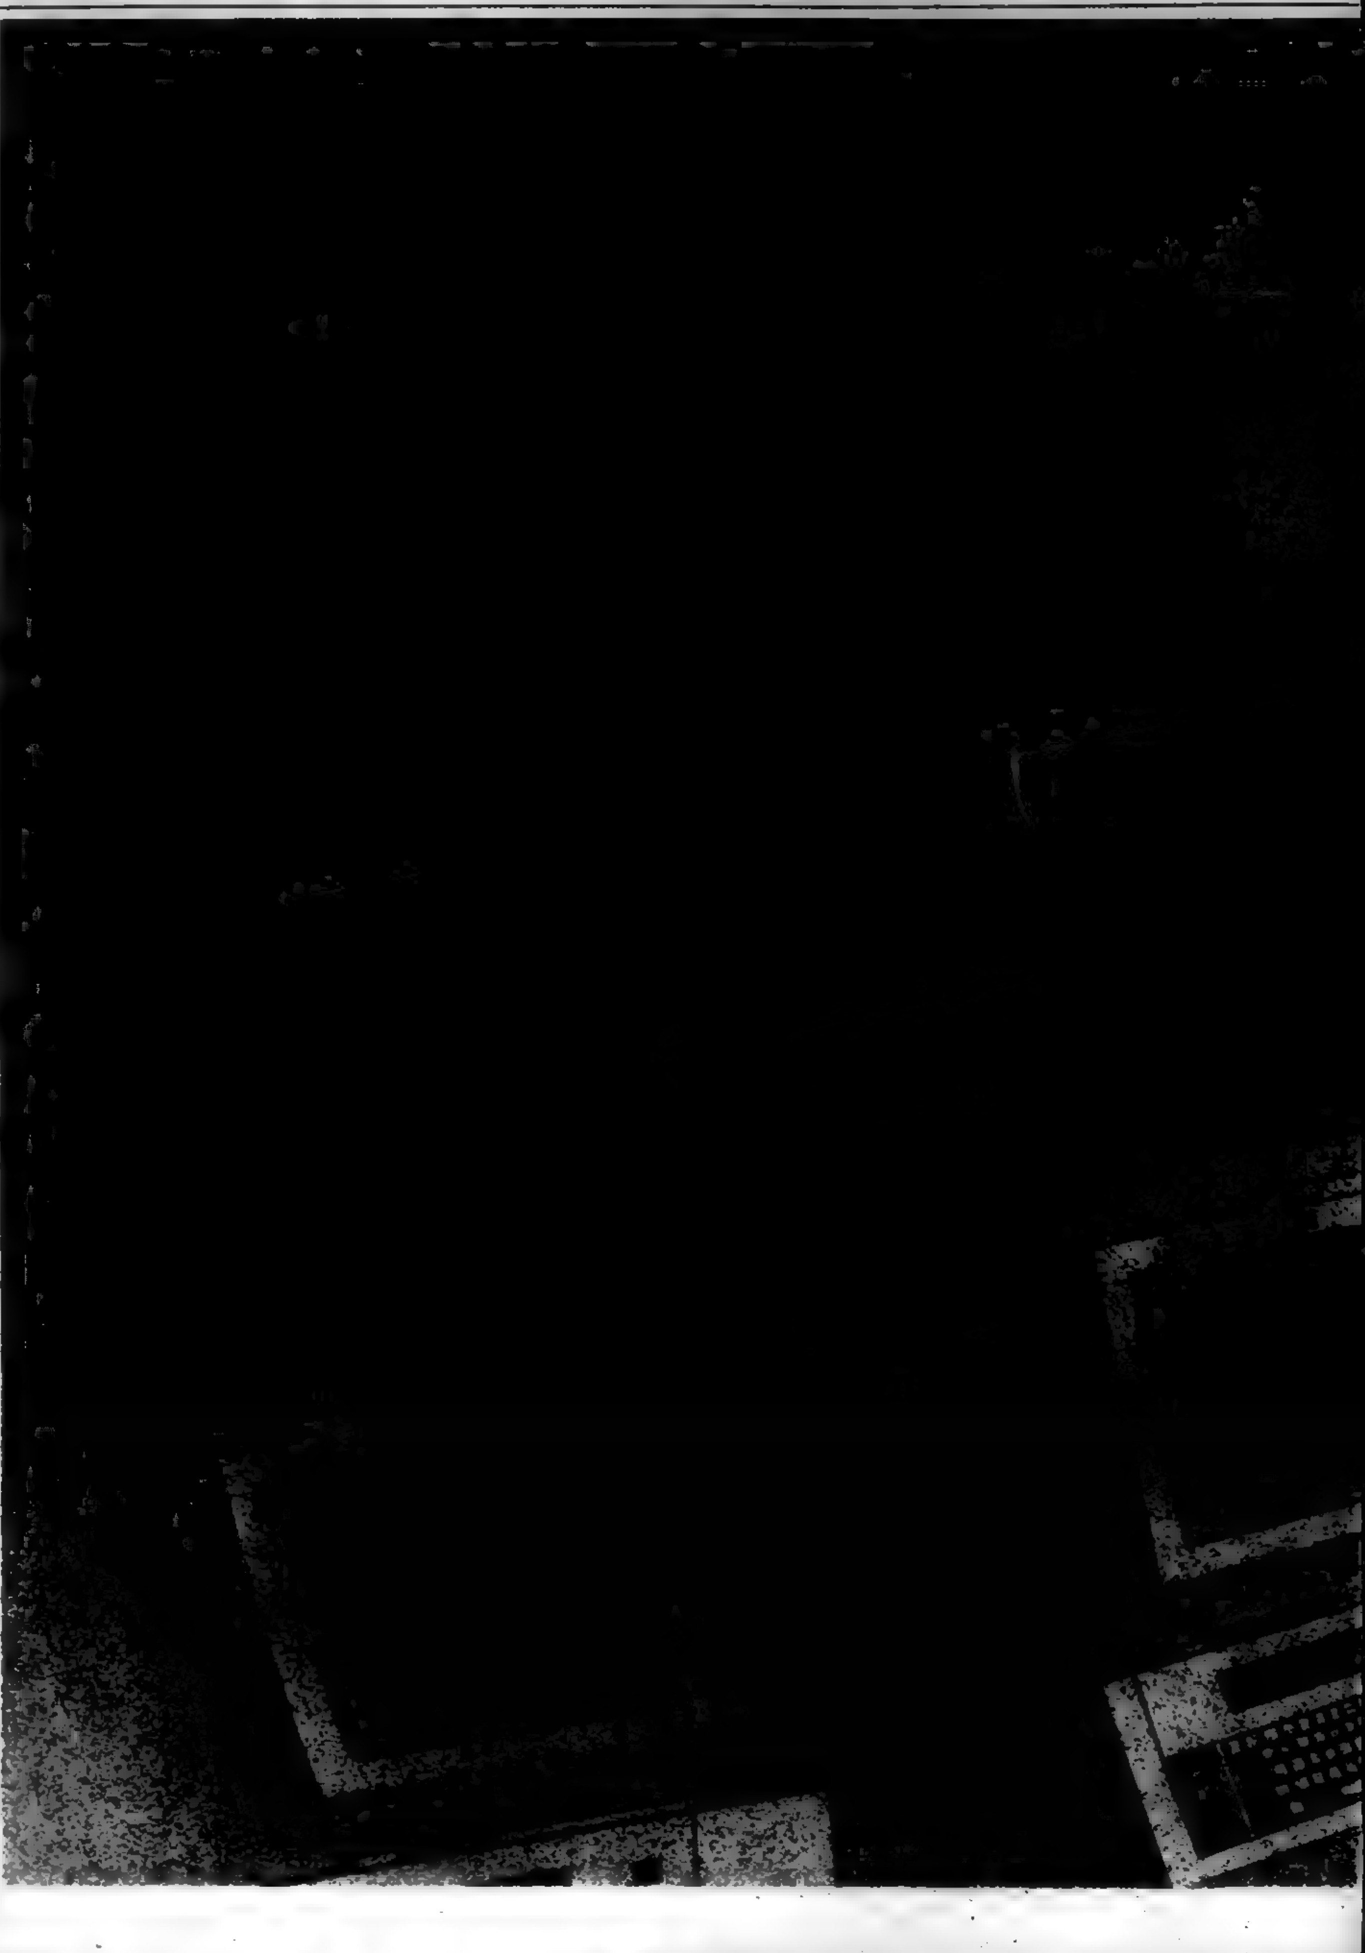
Wecker is president, Technology Concepts, Inc. in Sudbury, Mass.



Products

PALO ALTO, Calif. — Three micro-to-mainframe accessory products have been announced by **CXI, Inc.** Keyboard Mate is a keyboard attachment that adds 3270 series and 3270 function keys to existing keyboards, allowing CXI's Pcox and Digital Communications Associates, Inc.'s Irma emulation board customers to invoke 3270 functions with single keystrokes, the company said.

CXI's Coax Mate multiplexes signals from two controller ports through a single coaxial cable. The product links two category A coaxial devices (such as IBM Personal Computers that use any of CXI's coaxial connection boards or IBM 3270 series terminals) for data transmission over a single coaxial cable.

Daisy Chain Kit, the third product, is a modem bridge designed to permit several IBM PCs to be attached to a single leased-line synchronous modem.

Keyboard Mate's suggested retail price is $185. The Daisy Chain Kit and Coax Mate, the latter sold as a pair, are priced at $135 and $250 respectively.

For further information, contact CXI, Inc., 3606 W. Bayshore Road, Palo Alto, Calif. 94303-4229.

PALO ALTO, Calif. — **The Wollongong Group** has introduced a new line of networking software called Wollongong Integrated Networking Solutions (Wins), which the company said conforms to the TCP/IP protocols, a U.S. Department of Defense standard for networking communications.

WIN/PC lets IBM and IBM-compatible PCs participate in local- or wide-area networks, the vendor said, and is compatible with Wollongong's WIN/VX for Digital Equipment Corp. VAX minis. WIN/3B, a version to be distributed by AT&T for its 3B microcomputer customers, was also announced. Wollongong said the products share file transfer and virtual terminal capabilities. The file transfer feature allows the sharing of data across a network with any other machine, and the virtual terminal facility allows a PC or other computer to log onto another machine in a net.

WIN/PC costs $895 and quantity discounts are available. WIN/VX is priced at $15,000. Further information is available from The Wollongong Group, 1129 San Antonio Road, Palo Alto, Calif. 94303-4374.

WAKEFIELD, Mass. — **Applitek Corp.** recently announced Lantest, software that reportedly enables current Applitek users and those considering an Applitek local-area network to evaluate response time and throughput as the network load is increased from zero to 100%. According to the vendor, the software will also show the effect of running the network under various access methods such as CMSA/CD, token passing or Applitek's Unilink.

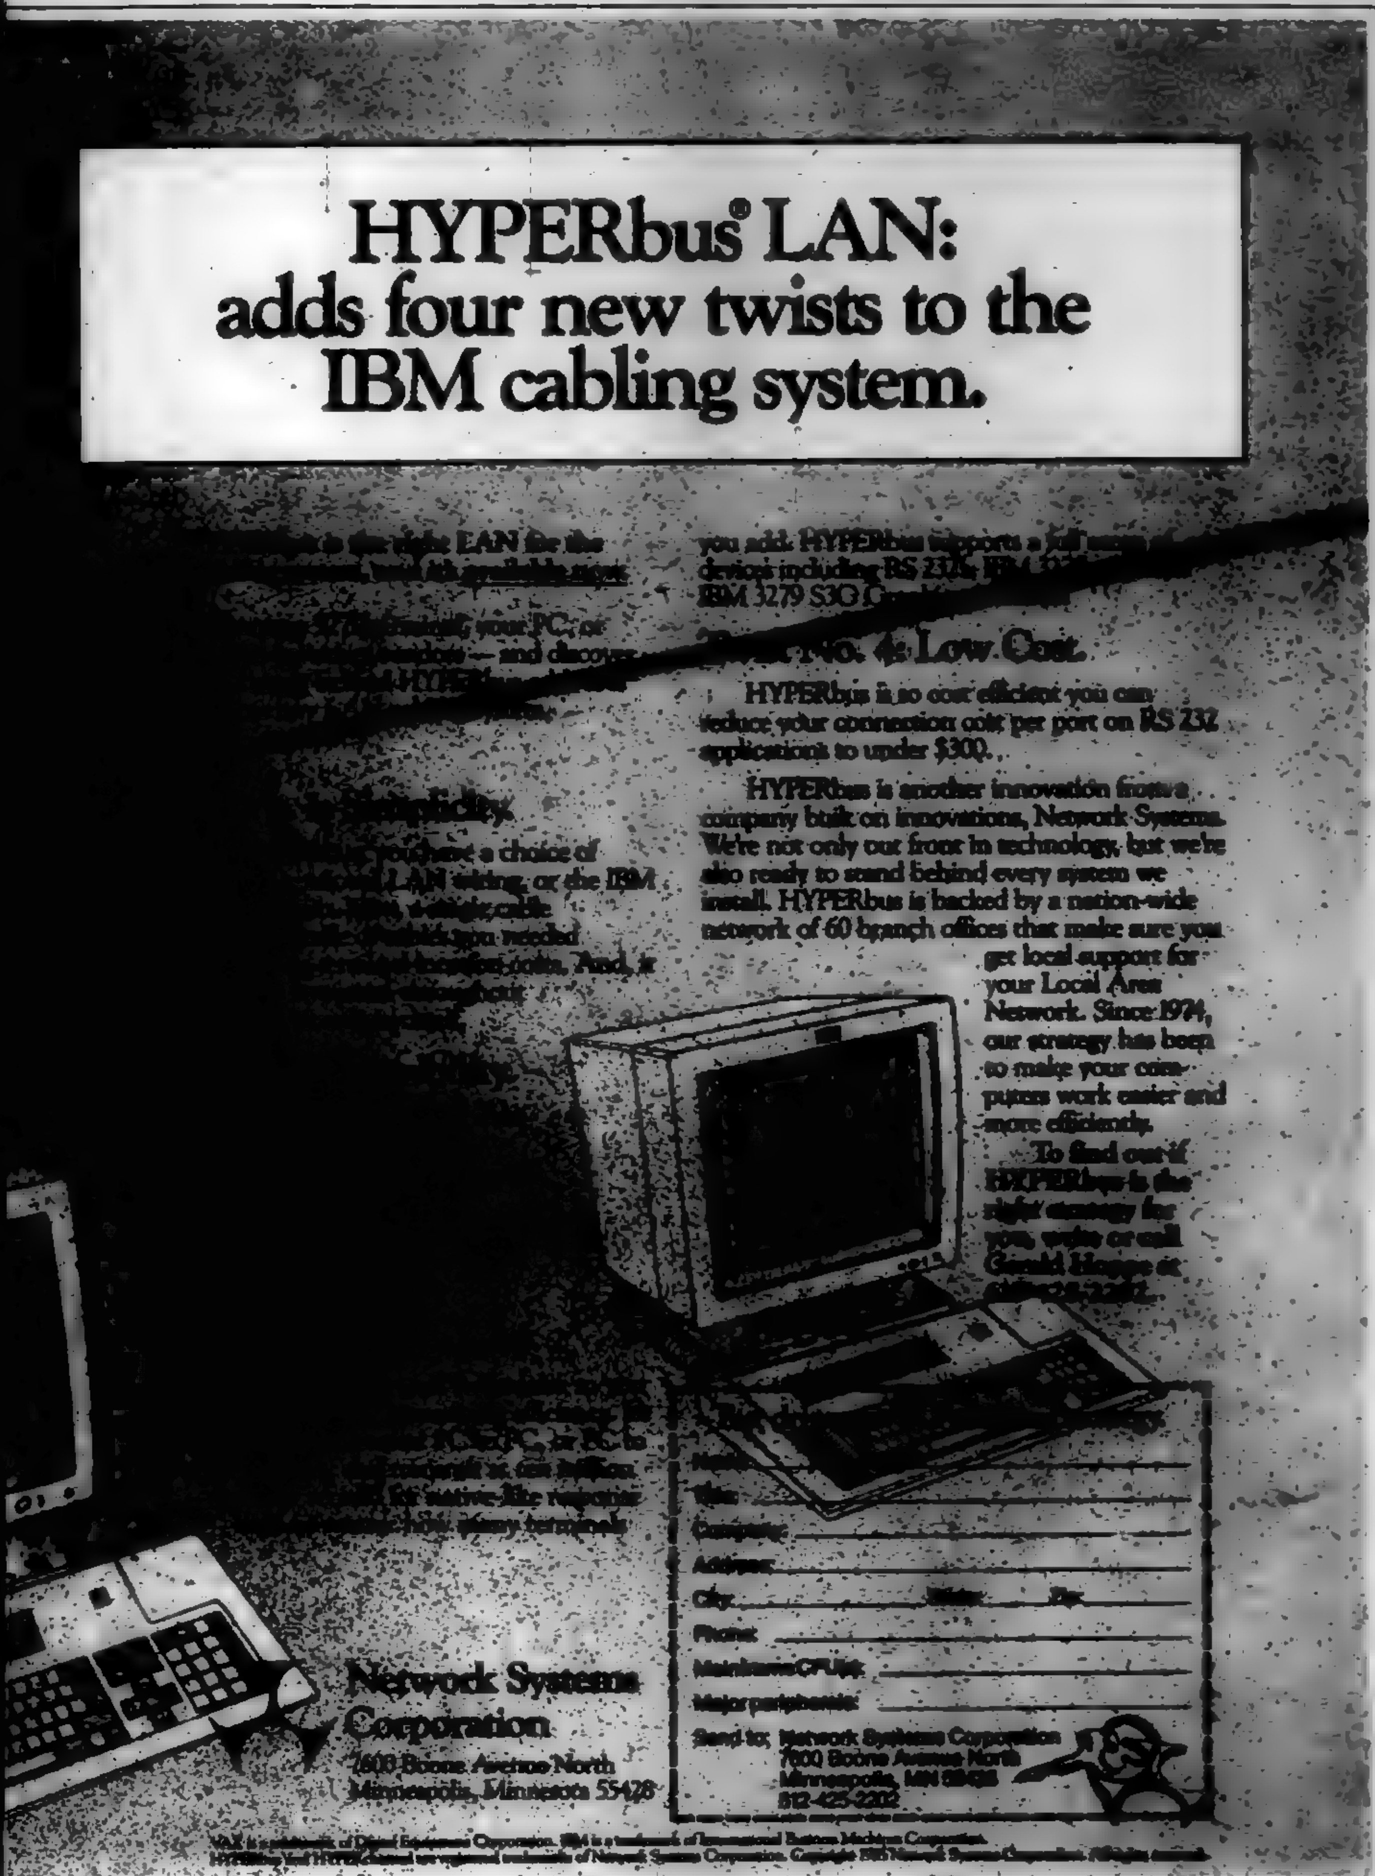
In addition to the software, Lantest includes four Applitek network interface units and a baseband, broadband or fiber-optic cable. Lantest will run on an IBM Personal Computer or compatible computer with at least 128K bytes of memory and a serial RS-232 port. Available immediately, the package costs $2,000.

Applitek is at 107 Audubon Road, Wakefield, Mass. 01880.

MILPITAS, Calif. — **Racal-Vadic, Inc.** has introduced the Multiple Data Set (MDS) II system, which the vendor said allows users to manage modems in a corporate dial-up network from a local or remote site.

MDS II consists of the VA1690 chassis, VA990 control card, VA2190 power supply card, VA4491E triple modem (2,400/1,200/300 bit/sec) and VA9000 system controller.

The VA1690 chassis is a front-loading, rack-mountable assembly with 16 slots for modems or other data communications products, one slot for the VA990 controller and one spare slot. Each of the 16 slots can accommodate two modems. The VA4491E is a V.22 bis-, Bell 212A- and Bell 103-compatible modem that can be configured



HYPERbus® LAN:
adds four new twists to the
IBM cabling system.

you add. HYPERbus supports a full [illegible] devices including RS 232s, IBM [illegible] IBM 3279 S3G [illegible]

No. 4: Low Cost.

HYPERbus is so cost efficient you can reduce your connection cost per port on RS 232 applications to under $300.

HYPERbus is another innovation from a company built on innovations, Network Systems. We're not only out front in technology, but we're also ready to stand behind every system we install. HYPERbus is backed by a nation-wide network of 60 branch offices that make sure you get local support for your Local Area Network. Since 1974, our strategy has been to make your computers work easier and more efficiently.

To find out if HYPERbus is the right strategy for you, write or call [illegible]

Products

for either the switched-telephone network or two-wire leased lines, according to the vendor. It provides full-duplex asynchronous and synchronous operation at 2,400 and 1,200 bit/sec and asynchronous operation from zero to 300 bit/sec. The VA9000 system controller is a personal computer-based option that reportedly allows supervision, monitoring, configuration and testing of a network from a single central site and can control up to 256 MDS II chassis and more than 8,000 modems.

The VA1690 chassis, equipped with a VA990 controller card and two VA2190 power supplies, is priced at $3,260. The VA4491E modem costs $1,095, and the VA9000 System Controller with interface board for an IBM Personal Computer or compatible computer and proprietary software is priced at $3,500.

For more information, write to Racal-Vadic, 1525 McCarthy Blvd., Milpitas, Calif. 95035.

MERRIMACK, N.H. — **Digital Equipment Corp.** recently announced All-in-1 Office and Information System software for the Microvax family of computers. In addition, the company also announced that through DEC's PC connection capabilities, IBM Personal Computers can tie in to VAX and Microvax environments.

The Microvax All-in-1 includes WPS-Plus word processing, electronic mail, desk management, time management and other office functions, as well as full Help functions and computer-based instruction. According to the vendor, the system can utilize Decnet and Ethernet communications for networking with other computer systems. Microvax All-in-1 also supports the Decmate Office Workstation, the Rainbow Office Workstation and the PRO Office workstation. The cost for the system is $4,023 per subscriber on a 30-subscriber system.

DEC's PC connection capabilities include a series of software products that enable IBM Personal Computers to communicate and transfer files with Microvax II and other VAX systems. With Decnet-DOS, IBM Personal Computer users can share data and files across a network, develop distributed applications and participate in other network functions. Vterm II allows the IBM Personal Computer to emulate a DEC VT-100 terminal and Poly-COM 220 and 240 enable IBM Personal Computer systems to perform file transfers and emulate DEC VT-200 terminals, the vendor said. Decnet-DOS sells for $495, Vterm II is priced at $160 and Poly-COM 220 and 240 cost $200 and $300, respectively.

DEC also announced enhancements to its VAX VTX videotex software and Rainbow/North American Presentation-Level Protocal Syntax (Naplps), which extends videotex capabilities to the Rainbow personal computer.

For more information, write to Digital Equipment Corp., Maynard, Mass. 01754.

PALO ALTO, Calif. — **Hewlett-Packard Co.** has introduced Systems Network Architecture (SNA) analysis software for its field-portable HP 4951A and the HP 4953A protocol analyzers.

Using both the HP 18186A and the HP 18153A SNA analysis packages, Hewlett-Packard protocol analyzers extract the upper-level information field by field from Synchronous Data Link Control (SDLC) I-frames and display it in high-level, easy-to-read SNA terms, HP said.

The HP 18186A/4951 is a portable SNA testing tool and provides the information needed to locate problems, particularly between cluster controllers and the SNA network, the vendor said. The HP 18153A SNA analysis application for the HP 4953A protocol analyzer allows the user to monitor, capture and analyze data traffic anywhere on the SNA network, even complex host-to-host communications, the vendor said. Both packages support simulation by allowing the user to define menus designed to trigger and send specific SNA messages. In addition,

Products

the packages can be employed anywhere SNA data flows over an SDLC link that uses any of the physical interfaces supported by Hewlett-Packard, such as RS-232C, V.35 and RS-449.

The prices for the software are $500 for the HP 18186A and $750 for the HP 18153A. HP is at 1820 Embarcadero Road, Palo Alto, Calif. 94303.

DALLAS — An enhanced version of the NCS70 Series Network Control System was recently announced by **Emcom Corp.** Among the enhancements is a real-time error and status message report, which allows the operator to scan the record of alarm conditions to identify recurring problems on a specific line or device. In addition, performance statistics can be transferred from the NCS70/30 to a host-resident data base, supported by Emcom's software, Network Communications Performance Analyzer.

The basic NCS70/30 system includes one rack-mountable performance measurement unit, an IBM Personal Computer color terminal and a four-color printer. Prices for the NCS70/30 begin at $75,000 for a 16-line system. For more information, write to Emcom Corp., Suite 901, 101 E. Park Blvd., Plano, Texas 75074.

CHELMSFORD, Mass. — **Apollo Computer, Inc.** has introduced its Open Architecture Program with a set of network products designed to integrate Apollo's Domain networking architecture with IBM's SNA, Digital Equipment Corp.'s VAX/VMS operating system and IBM PCs, PC ATs and compatibles.

The Domain/SNA package is aimed at distributing SNA resources across Apollo; Domain/Vaccess-1 downloads files from DEC VAX/VMS applications to the same applications on the Domain system. Domain/Vaccess-1 uses the Ethernet 802.3 transport standard and TCP/IP for data conversion. Domain/PCI is designed to allow certain personal computers to connect with Apollo workstations and share files. Domain /SNA is licensed at $1,700 per node, $7,000 per site; Domain Vaccess-1 at $5,000 per site; and Domain/PCI at $500 per node.

Apollo also introduced Domain/Bridge, a hardware and software communications package, which the company said provides the means to link up to five Domain networks and make them function like a single net. Apollo spokesmen said users have two Domain/Bridge link options: Domain/Bridge-A, a T1 class carrier link intended to extend the Domain single-system image across long distances; and Domain/Bridge-B, a coaxial cable link intended to partition large networks and make them more manageable. Domain Bridge A costs $8,400, one-time purchase; Bridge B, $8,900.

More information is available from Apollo Computer, Inc., 330 Billerica Road, Chelmsford, Mass. 01824.

SAN ANTONIO — **Datapoint Corp.** has introduced multimedia information network exchange (Minx) an office system that integrates data, voice and full-motion color video communications, the company said.

Minx consists of desktop workstations and one or more central controllers or servers. Each cluster server supports up to eight Minx workstations. The Minx workstation incorporates a color monitor, color camera, viewfinder and full-duplex speakerphone. The workstation is controlled by a mode selector and an attached keypad, which resembles a pushbutton telephone. The Minx workstation can be attached to its Arcnet local-area network through a Datapoint-supplied IBM PC interface card, the vendor said.

Minx workstations are priced at $11,100 each for quantities up to three and are discounted to $8,880 each for quantities of fifty and over. The cluster server is priced at $9,020, and the Minx to Vista-PC and IBM PC interface cards are $295 each.

For further information, contact Datapoint Corp., 9725 Datapoint Drive, San Antonio, Texas 78284.

Port is more than a LAN.
It's a complete networking solution for personal computers.

PORT –
Networking at its best!

To begin with, Port can network a variety of hardware products, including the IBM family of personal computers – and most IBM PC compatibles.

Flexible
With Port, you decide your network configuration. Port doesn't require a dedicated file server. Instead, each workstation has the ability to provide multiple services to every station in the network. You avoid the bottlenecks commonly associated with LANs because Port lets you distribute services throughout your network.

Robust
Because each workstation is independent of the others, your network won't fail if individual units do. Workstations can be removed from or added to the network dynamically – without affecting the rest of the network.

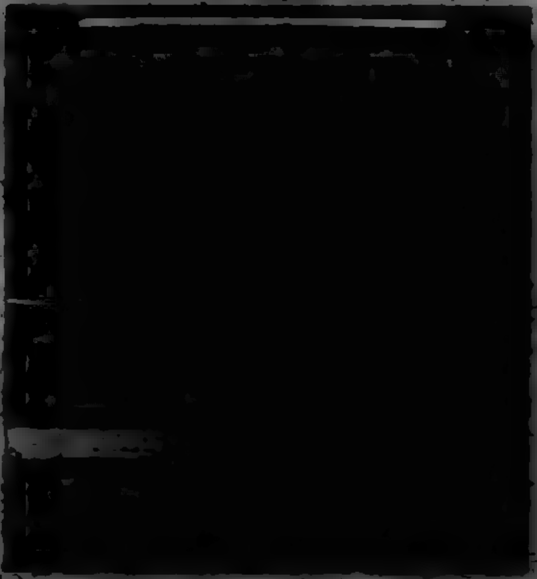
Secure
Confidentiality is no problem either. A sophisticated, yet remarkably simple security system strictly controls access to specific files through password login, voluntary attachment of network file services and file permissions.

PC-DOS Support
All versions of PC-DOS are supported by Port. They can even operate concurrently within your network. And Port provides up to 640K for DOS and its applications.

Advanced User Interface makes operation easy

Port combines these sophisticated network capabilities with an icon-based user interface that's responsive and easy-to-learn.

Think of Port's working environment as a building that contains many rooms (e.g. Lobby, Office, Supply). Each user can have his or her own



personalized office containing icons (e.g. Browse, Mail, Back-up). An activity is initiated by simply selecting the appropriate icon. Icons can even start PC-DOS applications. A mouse can be used to further simplify the procedure.

Multi-tasking/Windowing
With Port, up to 12 activities can operate simultaneously at each workstation. For example, you can run your favourite DOS program, print a document, browse a file system, and send electronic mail – all at the same time. Each activity has its own window which you can display or hide while the activity continues.

A design for the future

Port's design is the result of ten years of research at the University of Waterloo. Port solves the problems of PC LANs. That's why corporations such as IBM Canada, Cromtek and Computer Corporation of America sell products based on Port.

Continuing research and product development will ensure that your Port network always keeps pace with the future. Product enhancements are provided through Port's Software Update Service.

Get connected with PORT!

"We put 38 states on the line everyday. That's why we depend on Infinet."

Ron Thornhill

Ron Thornhill
Vice President, Operations
Contel Network, Inc.

Five thousand users throughout 38 states depend on Contel everyday to provide sophisticated communications services—everything from nearly a million credit card authorizations to extensive computer time sharing.

Keeping this nationwide data communications system online is vital to Contel's $4 billion business. If its communications network stops working, Contel and its customers stop working.

That's why Contel looks to Infinet.

As a leader in network management, control and diagnostics, Infinet provides Contel with the equipment it takes to achieve the up-time that Contel's users demand.

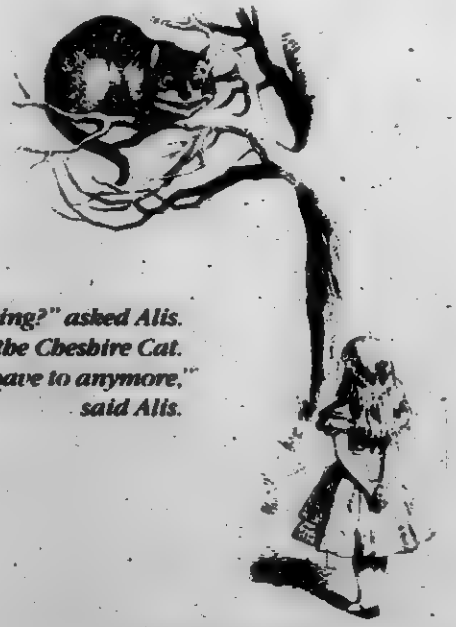
And that's keeping Contel's nationwide communications business in a very healthy state.

So if your business is on the line every day, call Infinet toll-free at **800-343-0664**. (In Massachusetts, call toll-free **800-322-1238**.) Ask for extension 5200.

INFINET

When your business is on the line.

Six Shattuck Road, Andover, MA 01801 617-681-0600



"What are you doing?" asked Alis.
"I'm waiting," replied the Cheshire Cat.
"Well, you won't have to anymore,"
said Alis.

If you've been waiting for the transportable office software system of the future, your wait is over.

Right now, more than a dozen major international computer manufacturers have decided to offer Unix*-based Alis,* a major advance in the world of office software.

To see what the excitement's about, come to Info '85, October 14–17, and see Alis running across the PC AT,* VAX,* and Sun Workstation.* The wonderland of office automation will never be the same.

See Alis. And smile.

Alis combines text, spreadsheet, graphics and database in single, always editable documents ☐ handles proportionally-spaced and multiple-size fonts WYSIWYG-style ☐ provides automatic formatting of reports, letters, memos, etc. ☐ sophisticated equation-solving spreadsheet ☐ drawing and business graphics ☐ personal and office databases ☐ integrated electronic mail and meeting scheduling ☐ multiple windows ☐ supports graphic workstations and terminals.

Sierra on-line in Texas

By James Connolly
CW Staff

BELLAIRE, Texas — A 10% faster response time, speedier repairs and savings on space, air-conditioning and power use: These are among the expected benefits when one of the first IBM 3090 mainframes goes into full commercial operation at a data processing center here tomorrow.

The installation of the 3090 Model 200 processor at Texaco, Inc.'s DP center was completed in just seven hours on Aug. 25. Following a week of diagnostic work and operator training, Texaco planned to use the Labor Day weekend for tying the new IBM 3090 to the $47 billion oil and gas giant's 9,000-user Interactive Computing System.

"We've got it powered up and scheduled to kick in over the weekend," said Ed McDonald, Texaco's division manager for information processing, in a telephone interview last week. "We're putting it into our interactive computing environment, where we run 24 hours a day. But with the three-day weekend, use should be light; so it will be in full operation on Tuesday."

McDonald said his first impression of the high-end IBM system was positive and that it was a state-of-the-art machine that addresses all of his realistic hopes. He said his unrealistic dreams are of futuristic features such as voice controls that replace operator keyboards.

"The major gains that I see, particularly with us becoming more and more on-line oriented, are the addition of extended memory, which will mean increased efficiency in computing power, the reduced

Javelin bucks software trend

Information base vs. spreadsheets

By Edward Warner
CW Staff

CAMBRIDGE, Mass. — Replace the electronic spreadsheet? For most corporate personal computer users, you might as well talk about replacing the coffee machine. Yet a start-up software company here, located a few blocks from Lotus Development Corp., plans this fall to launch a $695 product that it hopes will do nothing less than set a new software standard for computerized financial analysis.

Javelin Software Corp., founded two years ago by two veteran business graph-

ADR unveils enhanced DBMS tool

Datacom/DB upgrade may boost speed 30%

By John Desmond
CW Staff

PRINCETON, N.J. — A leading relational data base management system, Datacom/DB from Applied Data Research, Inc., received a series of performance enhancements aimed at speeding execution in production environments. Last week's announcement is viewed as central to ADR's strategy to have the product accepted in mainstream IBM shops.

The improvements, which the company said can boost performance by up to 30%, include the use of main memory buffers to save a series of updates for writing simultaneously to a disk. This "pipelining" improves performance by updating the data base with fewer I/O events, according to Ken Sloan, vice-president of research and development for the Datacom/DB system. "The announcement is significant because, up to this point, the flexibility and ease of use of relational systems had not been available to large users. This system solves that problem," Sloan said.

Early users of the enhanced product contacted by *Computerworld* faulted it for minor glitches but praised it for performing better and being easier to use. (See story page 6.)

Robert Cancilla, data base administrator for the Fremont Indemnity Co. of Los Angeles, obtained Release 7.4 of Datacom/DB late last year. The enhancements yielded performance improvements of 10% to 15%, he said. "While not as dramatic as we had hoped, it generally is a substantial improvement, especially in the ease-of-use

ANALYSIS

Data liberation: Dama on the barricades

By Jeffry Beeler
CW West Coast Bureau

The value a company attaches to a particular scrap of data depends to a great extent on where the data resides.

Store a piece of data in a corporate computing center, and everyone in the organization immediately recognizes the morsel as a strategic resource worthy of extraordinary care. But stick the very same data in a personal computer on some anonymous end user's desk, and its perceived importance instantly depreciates to almost nothing.

The unfortunate tendency to regard decentralized data as trivial is disturbingly widespread and can exact a heavy toll in the form of management headaches, needlessly high overhead and information redundancies or inconsistencies.

But disregard for user-held data is by no means universal. In fact, the indifference has lately spawned opposition that proponents usually refer to as "data administration."

If the cause's standard bearers were political activists instead of technologists, they would probably describe themselves as "data liberationists." In the eyes of data administration's supporters, all corporate information is equally entitled to treatment as a strategic resource, regardless of its physical location.

"Data administration focuses on corporate information [in its totality], not just on the portion that happens to reside in a central mainframe system," according to independent consultant David Schryver, one of the infant movement's most vocal advocates.

With the proliferation of professional microcomputing and the attendant dispersal of corporate information, interest in data administration has grown steadily. One manifestation of this heightened concern is the recent birth and development of the Data Administration Management Association, according to Don Luchsinger, current president of the group's Los Angeles chapter.

NEWSPAPER

Lotus to offer 1-2-3 discount

Renewal of volume discounts follows pressure from buyers

By Edward Warner
CW Staff

Lotus Development Corp. reportedly plans to sell upgrade copies of its forthcoming new release of 1-2-3 directly to large-volume users — at a discount of $50 off the $150 standard upgrade price for each package.

The plan would mark Lotus' return, under growing pressure from large corporate users, to bulk purchase discounts, at least for upgrades. The distribution plan also exempts large-volume 1-2-3 users from having to return their old 1-2-3 system diskettes as they upgrade, a first for Lotus.

The distribution plan was detailed in a meeting and subsequent telephone conversation between Robert Corr, president of an association of microcomputer managers from 30 Fortune 500-size companies, and Steve Crummey, Lotus vice-president for sales and service, Corr said.

The plan would only affect existing users of 1,000 or more copies of the top-selling Lotus spreadsheet, said Corr, president of Technology Advancement through Strategic Cooperation.

Corr, an office automation director with General Motors Corp.'s Electronic Data Systems Corp. subsidiary, said that Crummey also assured him that users of 1,000 or more copies of 1-2-3 will not need to return their system diskettes to Lotus when they order an upgrade to Release 2, which is expected to ship this month.

Instead, he said, these users will be able to destroy their old system diskettes at their locations as they upgrade.

Crummey could not be reached for comment. Ellen Hoffman, 1-2-3 product marketing manager, said Lotus would not comment publicly on the existence of discounts or special upgrade arrangements for its large-volume users.

Although only existing users of 1,000 or more copies of 1-2-3 would be affected by the discount plan, they would not need to order all of their upgrade copies at once, Corr said. Instead, he explained, such large-volume users could commit to ordering at least 1,000 copies of the upgrade package and receive the discount for initial minimum orders of 250 copies.

Corr said he first learned of the 1-2-3 upgrade plan at a recent meeting he attended with Crummey and 17 members of Technology Advancement through Strategic Advancement. Corr said that Crummey told those at the meeting about Lotus' original plan for a mail-in exchange program and that the attendees requested that Lotus "give us instructions to destroy the [old] system diskettes in the field."

McDonnell Douglas cuts work force

By Clinton Wilder
CW Staff

ST. LOUIS — Four units of McDonnell Douglas Corp.'s Information Systems Group trimmed their payrolls by a total of approximately 340 employees last week in a cost-cutting move. The company also acknowledged a work force reduction of approximately 200 additional positions through attrition and performance-related dismissals since July 1.

The division hardest hit by last week's layoff was McDonnell Douglas Communications Industry Systems Co. in Denver, which trimmed 18% of its 500 employees. Three other larger units cut their staffs by 5% to 6%.

Information Systems Group spokesman Ford Phillips said that the four units affected by last week's cuts were running operating losses and were forced to cut costs to remain on track in the company's long-range plan.

Seven other Information Systems Group units have met or exceeded their target revenues so far this year, Phillips said. The 200-employee attrition cut was spread over all 11 units and affected less than 1% of positions in most units, according to the spokesman.

Phillips said last week's cuts affected employees across the board, including managers in each of the four units and 11 other managers in St. Louis-area divisions. The businesses affected by the layoffs are as follows:

■ McDonnell Douglas Communications Industry Systems. The unit dismissed 90 employees, citing slow sales of its information systems to the divested Bell operating companies in the wake of the AT&T breakup.

■ McDonnell Douglas Business and Network Systems Co., Cupertino, Calif. The vendor of computer network services issued 100 pink slips, a work force cut of 6%.

■ McDonnell Douglas Computer Systems Co., Irvine, Calif. The vendor of minicomputer and mainframe hardware dismissed 85 employees, or 6% of its work force.

■ McDonnell Douglas Field Service Co., Irvine, Calif. A 5% cut, totaling 60 positions, was announced at the provider of field service support to McDonnell Douglas and other companies.

"The layoff was a business unit by business unit decision," Phillips said. "These units had business slowdowns, the same as everyone else in the industry, and it was impossible for them to make their target numbers without a work force reduction."

Dismissed employees will be provided with a minimum of two weeks' and a maximum of 13 weeks' severance pay, according to Phillips.

SMART COOKIE

Like you, SyncSort DOS is cut from a special mold.

Call (201) 568-9700.

It's healthy for your system.

One thing about smart cookies, they can spot each other a mile away.

While they don't flaunt their derring-do, they quietly know they're the best at what they do. Because substance shows through. Every time.

Especially when the going gets tough. And rough. As it often does in a DOS environment.

For example, a smart cookie doesn't crumble under the pressure of too many programs and too few programmers.

A smart cookie doesn't waste dough — but picks and chooses the right ingredient to keep production on the rise.

And sometimes, even, a smart cookie has to be a mighty tough cookie. That means being on the job constantly. Keeping things running and humming. Without draining vital resources.

All of which brings us to our smart cookie: SyncSort DOS. A cut above the rest if you ever saw one. Check these delicious advantages.

Better Performance

Pop one into your system and you'll see a mouthwatering difference. Immediately. SyncSort DOS will give you performance improvements like those shown in the chart on the left.

And performance features such as:

- Automatic Secondary Allocation. With this feature your sorts will never run out of disk space, i.e., no "sort capacity exceeded" messages.

Better Features to Improve Programmer Productivity

As you begin to digest SyncSort DOS, you'll find it more and more to your liking. With ingredients that cut down to size the amount of programming time going into applications.

- **SortWriter** — A powerful tool that can produce extensive reports as a by-product of your normal sorting — without user exits and the associated programmer investment. Headers, trailers, total and sub-total capabilities provide flexible formatting.
- **Record Formatting** — Powerful features like INCLUDE/OMIT, INREC/OUTREC, SUM and others — with capabilities like data conversion, editing, insertion of literals.
- **Multiple Output** — From a single sorted file, you can create multiple files and reports. Each can include the same or different data as determined by INCLUDE, OMIT, OUTFIL or OUTREC parameters.

Better Customer Service

Still another sweet advantage of SyncSort DOS: help is always there when you need it. 85% of all requests for service are resolved within 24 hours. We always rise to the occasion.

The moral to this story: smart cookies are quick to reject half-baked solutions in favor of SyncSort DOS. Call us for a demonstration. Once you get a taste you will be hungry for more.

SyncSort DOS
One smart cookie deserves another.

NAS enhances high-end processor family

By Jeffry Beeler
CW West Coast Bureau

MOUNTAIN VIEW, Calif. — Responding to user demand for increased system performance, National Advanced Systems Corp. (NAS) last week enhanced its high-end processors with the addition of assorted microcode assist features and expanded main memory and channel capacity.

In the wake of the enhancements, company spokesmen here said that NAS has quadrupled to 128M bytes the maximum central storage capacity for the most powerful member of its Advanced System/8000 mainframe family — the AS/8083. As part of the same announcement, the supplier of large IBM-compatible CPUs has also doubled to 64M bytes the top main memory capacity for the 8000 line's other four members — the 8023, 8043, 8053 and 8063.

In addition, NAS has expanded the maximum channel configuration for its AS/9070 and AS/9080 processors from 32 to 48 channels and enlarged the central storage for its 9040 and 9050 from 48M bytes to 64M bytes, the source said. All four mainframe models belong to the vendor's AS/9000 line, which competes with IBM's 3081-series machines.

In a related development, the firm has made the Preferred Machine Assist (PMA) available as a standard feature on its 8000 family, according to Mitch Schoch, director of NAS' North American systems marketing. PMA, which minimizes overhead for systems that run a guest control program under VM, had previously been provided with the 8000 series solely as an option.

NAS has also enhanced the 8000 line to support for the first time Extended Control Program Support:VM (ECPS:VM), which improves mainframe performance under VM by transferring four assist functions from machine instructions to microcode, Schoch said.

The functions, which form ECPS:VM's constituent parts, include Expanded Virtual Machine Assist, Control Program Assist, Virtual Interval Timer Assist and Shadow Table Bypass Assist.

In the past, each of the four microcode features, which Schoch described as "performance kickers," was typically restricted to IBM 4381s or comparable intermediate-scale processors running interactive applications under VM. So when users outgrew their existing 4381-class machines and upgraded to IBM 3083-level processors to increase their capacity, they were forced to abandon their familiar ECPS assist functions and convenience features.

'Best of both worlds'

But now users "can have the best of both worlds," Schoch said. "They can retain the price/performance and the convenience functions of their 4381s" even as they take advantage of the expanded performance of the 8000-series processors, which correspond mainly to IBM's 3083 family of large-scale CPUs.

"Our goal in offering [the four microcode assist functions] on the 8000," Schoch added, "is to position the machines as a true growth path for intermediate systems users."

Each of ECPS:VM's four assist functions is available to 8000 series users without charge. An 8M-byte main memory enhancement for both the 8000 and 9000, however, costs $96,000, compared with $123,000 for an increment of eight channels for the 9070 and 9080.

DATA from page 1

Dama, which seeks to advance the field of data administration, first arrived on the scene about five years ago with the formation of the organization that Luchsinger now heads. Among the association's charter members is Schryver, who preceded Luchsinger as Los Angeles chapter president.

Two or three years later, Dama's original chapter was joined by a second such local group based in San Francisco.

The association is again widening its geographic scope by establishing two more chapters, one in Minneapolis-St. Paul and the other in Seattle. During its roughly six months of existence, the Twin Cities group has averaged more than 60 attendees per meeting, Schryver said.

The Seattle chapter is an even more recent addition to the Dama family of players. It apparently has existed only long enough to meet once or twice, Luchsinger said.

Dama's expansions have swollen its nationwide ranks to about 800 members, Schryver said, and the growth shows every indication of continuing. Luchsinger has received reports about the possible emergence of yet another local Dama chapter, this one in New York, and Schryver speaks optimistically of someday "taking the association national."

Although Luchsinger shares Schryver's aspirations for a nationwide organization, he seems perfectly willing, for the moment, to bide his time. "I think we need to establish a stronger footing locally in some of our chapters before we try to form a group that would operate nationally," he said.

To Luchsinger, Dama's steady growth in both membership and geographic coverage signals an increasing awareness of the acute need to manage data like cash or any other strategic resource. "Many people already have a firm grasp of the issue," he said, "but have done very little to address it because it's so hard to turn things around."

Without divulging any names, Luchsinger cited several large user organizations that have tried repeatedly to establish internal data administration efforts, only to fail miserably because of a lack of commitment by upper management.

To succeed, any attempt to introduce a corporation to data administration requires a champion with plenty of executive clout, he said. "Ideally, the individual should be an IRM [information resource management] vice-president who reports directly to the company's president."

JAVELIN from page 1

ics system developers, plans to achieve this seemingly herculean task by basing its new product, also called Javelin, on what it calls an information base, a structure much like a data base.

Because data entered into Javelin is stored in a data base and not in the rows and columns of a spreadsheet, most of the problems inherent in the use of spreadsheets are avoided, according to Dick Bonzagni, Javelin's vice-president of marketing, who demonstrated the Javelin product recently to *Computerworld*.

Javelin, he said, sidesteps traditional spreadsheet problems, such as the need for all spreadsheet grids to match when their data is combined. The information base, he explained, links numbers with cross-referencing words, such as names or terms, and dates. The words can be from any language, and the dates can be drawn from a built-in calendar. Together, they act as tags to the data, permitting users to call up all data associated with a word, say "expenses," or a particular date.

Just as important, he noted, the words that make up the Javelin information base can be automatically linked and displayed in a flowchart that shows their relationship. Such a diagram could show that a Javelin spreadsheet's underlying logic was for various "operating expenses" of several "divisions" to be combined into "total expenses" and then subtracted from "total revenue."

A spreadsheet, by contrast, gives no overall picture of the train of logic on which it is built. To understand a spreadsheet's logic, the user must backtrack through each of the formulas that form the basis for each of the spreadsheet's rows.

Although Javelin hopes to replace the spreadsheet method of data management, it does not purport to replace the spreadsheet method of business analysis, Bonzagni said. Javelin, he explained, lets users draw data from its information base to create a row-and-column spreadsheet that looks much like that produced by Lotus' 1-2-3 package.

As with 1-2-3, users can do a "what-if" analysis of a Javelin spreadsheet, as well as create line, bar and pie charts. Users can also import files, either directly from 1-2-3 or as Ascii files from such software as Ashton-Tate's Dbase line, Bonzagni said. Ascii files are imported into Javelin as they would be into 1-2-3 in order to permit users to continue to use the download routines they have already written for use with 1-2-3, he added.

Javelin runs on the IBM Personal Computer with at least 512K bytes of memory and two diskette drives.

The company plans to begin shipments of Javelin this fall when there will also be a formal introduction of the product. In the interim, Javelin officials are demonstrating the program for individual members of the press. Though he declined to discuss distribution details, Bonzagni said the product will be directed at end users and MIS departments.

Javelin's biggest shortcoming is expected to be its requirement that all of its users adopt the same names for the same data if they expect to share data or combine their spreadsheets into one.

Bonzagni, however, maintained that this feature actually represents a potential asset to MIS management in that it can be the basis on which standard names are set for the data manipulated by all of the firm's personal computer users.

Straitjacketing standardization

Spreadsheets, Bonzagni maintained, require an even more straitjacketing standardization — the use of the same grid by every user. If one of several spreadsheet users departs from the standard spreadsheet grid — eliminating the row where, say, sales for a certain date are recorded — the error will invalidate the spreadsheet that results when the several spreadsheets are combined.

That, Bonzagni said, is one of the spreadsheet faults prevented by Javelin's information base.

Those with little or no spreadsheet experience can use Javelin more easily than a traditional spreadsheet, like Lotus' 1-2-3, he said. Unfamiliar users, he explained, could choose to enter data to the information base by drawing a chart or graph, a twist on the usual spreadsheet formula in which graphs are used with output.

Bonzagni also pointed out a feature called The Speller, which he said memorizes all of the commands, file names and terms entered by the user.

A dictionary of those terms and commands is available in a pull-down window from which users can cut and paste words for use as spreadsheet labels. They can also invoke commands from that dictionary, as they would using macros.

HP commits to Spectrum, boosts 3000

PALO ALTO, Calif. — The next generation of Hewlett-Packard Co. minicomputers, high-end systems based on the company's Spectrum architecture, will be introduced in early 1986, according to company President John A. Young, who also promised a smooth software migration to the new systems.

Young last week made his first public commitment to a time frame for Spectrum while announcing a mid-range system and upgrades for the HP 3000 family of business computers. The mid-range system is the HP 3000 Series 58. The upgrades are from the previous mid-range system, the HP 3000 Series 48, to the Series 58; and from the HP 3000 low-end systems to the HP 3000 Series 42XP.

"Our commitment to protecting customer software investments remains a central goal of the Spectrum program, not only for future HP 3000 products but also for future high-end HP 1000 real-time systems and HP 9000 design systems. With hardware development and testing virtually completed for the first products of the Spectrum program, our attention is fully focused on making software migration as smooth as possible," Young said.

The Series 58 is said to feature 50% higher performance than the existing Series 48 with the help of a 32K-byte memory cache and double the maximum main memory at 8M bytes.

The other upgrade announcement was that existing HP 3000 Series 39, Series 39HP, Series 40 and Series 42 systems can be upgraded to the new Series 42XP to achieve performance gains of 25% to 40%, according to the company. The Series 58 costs $94,500. Field upgrades for the Series 42 and Series 48 cost $37,500. Upgrades for the Series 39, Series 39HP and Series 40 cost $40,000.

CDC to offer office automation software

Century Analysis fits product to NOS/VE

MINNEAPOLIS — Another mainframe hardware vendor is seeking to protect its turf by offering its users office automation software. Control Data Corp. last week announced an agreement with Century Analysis, Inc. to port that firm's OA software to CDC processors.

The CDC entry will run under the company's NOS/VE operating system on the full range of CDC systems, from the entry-level Model 180 to the high-end Model 990.

CDC spokesmen said the resulting package is intended to offer functions equivalent to those of Digital Equipment Corp.'s All-In-One, IBM's Professional Office System and Data General Corp.'s CEO office automation software.

The CDC software is scheduled to be available sometime in 1986, a spokesman said.

The development agreement appears to be CDC's attempt to stem the loss of users to competitors due to a lack of OA software, rather than an effort to win new customers. CDC has made its mark in the industry selling number-crunching processors for scientific applications.

Because of the company's mainframe orientation, Century Analysis was chosen to port its Officeware OA software to run under NOS/VE, a CDC spokesman said.

The Officeware packages include word processing, spreadsheets, business graphics and record management applications.

Officeware Applications for networking include electronic messaging and document transfer, shared scheduling and shared printing and archiving.

The Cyber 180 version of Officeware may include a distributed processing environment, enabling users to access word processing and spreadsheet applications locally on personal computers or by tying into the Cyber 180 mainframe.

FASTER THAN A SPEEDING BULLET

Today, providing faster and more cost effective software is critical to the success of any data center. Here's why *PDSFAST* is the standard at over 500 of the best:

PDSFAST benchmarks taken from user evaluations:

	Elapsed Time	CPU Time	EXCP's	Job Cost
52 cyl. PDS Compress				
Iebcopy	67 min. 18 sec.	12 min. 27 sec.	103,486	$131.05
PDSFAST	3 min. 23 sec.	8 sec.	712	$4.22
12 cyl. PDS Copy				
Iebcopy	9 min. 14 sec.	1 min. 20 sec.	10,792	$18.47
PDSFAST	48 sec.	.7 sec.	122	$1.75
47 cyl. PDS Unload to Tape				
Iebcopy	58 min.	14 min. 52 sec.	97,253	$92.05
PDSFAST	4 min. 3 sec.	37 sec.	911	$5.74
3380 TSO Volume Compress 2,679 Individual PDS's				
PDSFAST Driver	11 min. 7 sec.	31 sec.	8,299	$29.87

The PDSFAST driver interfaces with all DASD management and DEFRAG packages.

☐ **DASD Space Reclamation** PDSFAST can increase DASD space reclamation by 40 to 60 percent.

☐ **DASD Management** PDSFAST interfaces with ALL EXISTING DASD MANAGEMENT PACKAGES reducing elapsed times by 75 to 90 percent.

☐ **IEBCOPY Usage** PDSFAST is a JCL-transparent replacement for Iebcopy. It will compress, copy and unload PDS datasets to tape or disk at 5 to 80 times the speed of Iebcopy.

☐ **CICS**—Reduces compression time from 30 minutes to 1 minute for CICS Libraries.

☐ **SPFCOPY** Provides ultra high speed compression under SPF 3.1 WITHOUT REQUIRING AUTHORIZATION.

☐ **SMP Processing** Speeds up ALL LEVELS of SMP processing by 25 to 90 percent.

☐ **IMS**—95% reduction in compression time for IMS Libraries.

PDSFAST is saving thousands of dollars daily in human and machine resources at hundreds of sites worldwide. We are sure PDSFAST will benefit your installation.

For further information about PDSFAST call SEA at (212) 206-7660, located at 150 Fifth Avenue, New York, NY 10011.

SOFTWARE ENGINEERING OF AMERICA SEA

ADR

from page 1

features and the reduction in manpower required to operate the system," Cancilla said. "It's closer to a 24-hour environment, but it's still not there," he said, noting he still has to shut down his on-line system when he needs to perform certain maintenance tasks.

Datacom/DB's enhanced Data Query interactive relational query facility "has a long way to go to be a real user-friendly tool," Cancilla said. Data Query needs to be more closely integrated with the data dictionary to give users a good explanation of the data they have retrieved, he said.

Haydon Gaines, manager of data administration at Equitable Life Leasing Corp. of San Diego, a company that leases computer equipment mostly to Fortune 500 firms, began using Release 7.4 of Datacom/DB a month ago.

"We've had pretty good response" with the enhanced Datacom/DB, Gaines said. "Users notice the difference. Their screens come back faster, and the file size is the same. The file accesses and queries are much faster."

Some jobs that previously took one hour to execute now take 15 minutes, he said. "The pipelining and clustering features really increase performance on the large sequential-type files," such as accounts receivable and fixed-assets applications from Management Science of America, Inc., he said.

Several analysts observed that the announcements were made with an eye toward the No. 1 player in the DBMS market — IBM, which earned $600 million from DBMS-related sales in 1984 — and its DB2 relational DBMS.

Shaku Atre, president of Atre International Consultants, Inc. of Rye, N.Y., said the Datacom/DB enhancements are intended to exploit the Achilles' heel of ADR's biggest competitor. "They are trying to make the best of the weakness of their opponent," Atre said, noting that IBM's DB2 has been criticized by some of its users for being too slow. "ADR is being very creative in trying to come up with features to compete with DB2. The main thing they needed was performance improvements."

One analyst said the Datacom/DB enhancements appear to deliver on the promise of a unified solution fulfilling both user and production requirements. According to Damian Rinaldi of International Data Corp., a Framingham, Mass.-based market research firm that recently ranked Datacom/DB as the No. 3 independent DBMS, "Current relational models can't provide the support users need. Most represent compromises that provide a subset of ease-of-use features without sacrificing performance. What ADR is doing here is [addressing] the trade-off of meeting users' needs without sacrificing performance."

Peter Lowber, of the Boston-based Yankee Group, added, "Performance has been an issue. This will help ADR compete more directly with [Cullinet Software, Inc.] in high-performance transaction processing environments."

■

Enhanced Datacom/DB version includes storage management

Highlights of the Applied Data Research, Inc. (ADR) data base management system announcement included the following:

■ Datacom/DB 7.4, succeeding 7.3, offers storage management options, including clustering, in which related data is physically stored together to optimize the relational Join command and to speed the processing of related records. Other space management options permit Datacom/DB to be tuned for the processing pattern of applications.

The enhancements allow tasks to be processed in priority when multiple tasks are available for servicing. With user-specified parameters specifying the detail, accounting information is provided using ADR's Ideal fourth-generation applications development system and Data Query interactive relational query system.

■ Ideal 1.2, succeeding 1.1, features enhancements to the data manipulation language that take advantage of the extended Compound Boolean Selection Facilities in Datacom/DB. Early support site users of the product spoke highly of the extended facilities. The Boolean feature simplifies the task of building files from data stored in different physical data bases, a spokesman said.

New screen processing options in Ideal include support for the IBM 3279 color terminal, extended highlighting, increased print and Help command processing and enhanced cursor control. Data transmission overhead has been reduced by shortening the length of IBM 3270 data streams. Release 1.2 also reduces the CPU overhead required to generate data streams and streamlines the user sign-on and virtual storage requirements of screen definition panels.

Ideal's printing services have been extended to printers networked under control of IBM's CICS.

■ D-Net 1.2, succeeding 1.1, enhances Datacom/DB's distributed data network manager for organizations with multiple IBM mainframes at one location. D-Net now provides high-speed channel-to-channel coupling for stand-alone IBM MVS and MVS/XA host systems loosely coupled with IBM's Multisystem Channel Communication Unit. The channel-to-channel support is said to allow organizations to distribute and share data base processing among multiple CPUs more easily.

The updated D-Net also provides full concurrent update protection and restart and recovery and transaction back-out services. System maintenance and changing of the data base can be performed without interrupting on-line processing.

■ ADR/DL 2.1, succeeding 2, more closely integrates the company's high-level Cobol language facility for Datacom/DB with ADR's active Data Dictionary. The enhancement is said to give data base administrators tighter control of the use of data views, especially in large MIS shops.

The updated ADR/DL release provides for relational operations on Datacom/DB using the Boolean facility. ADR/DL's relational data base management language is now modeled after Ideal's, to provide consistent methods for developing applications, a spokesman said.

■ Vsam Transparency 2, succeeding 1.1, allows users to restructure Vsam records into Datacom/DB to get more use of its relational capabilities and to allow non-ADR software to be migrated to the data base. Data can be transferred from Vsam to Datacom/DB and can be restructured automatically. The updated release eliminates relinking of batch programs previously needed to activate the Vsam Transparency, lessening the demand for computer resources.

■ CICS Service Facility 2.3, succeeding 2.2, has been enhanced for sites running MVS/XA. The facility can now accept calls from CICS application programs that are running above or below the 16M-byte line.

■ Data Query 3.1, succeeding 3, has been updated to support the Japanese Kanji language. The product also supports English, French and German. Enhancements to Data Query are aimed at improving on-line and batch sort functions.

The price for the enhanced ADR/Datacom System, provided free to users with maintenance agreements, is $116,000 for users in IBM DOS environments and $145,900 for IBM OS/VS1, MVS and MVS/XA users.

— John Desmond

■

Users cite performance gains, glitches in early Release 7.4

It had some glitches, but it did improve performance, said three users of an early version of Applied Data Research, Inc.'s (ADR) enhanced Datacom/DB relational data base management system.

Robert Cancilla, data base administrator for the Fremont Indemnity Co. of Los Angeles, obtained Release 7.4 of Datacom/DB late last year. His shop runs an IBM 4381 Group 2 with 8M bytes of main memory, the DOS/VSE 3.5 operating system running under VM and CICS 1.6.

He was an early suport customer of the enhanced Datacom/DB, ADR/DL Cobol language facility, Data Query interactive relational query system and CICS Service Facility.

His shop processes, in an average eight-hour period, 135,000 CICS transactions and 1.5 million data base service requests, Cancilla said. In 24 hours, he said, the shop processes some 5 million data base service requests.

Performance improved from 10% to 15% in his shop with the enhanced Datacom/DB, Cancilla said. While performance was impressive, enhancements to make the data base available for 24-hour updating came up slightly short for Cancilla.

"They claim you don't have to shut the software down to make changes. But realistically, you have to disable one or more tables or files to maintain the system. We can't shut down one piece and continue running. [ADR] still can't make maintenance changes on the fly while the world is still operating," Cancilla said.

The Data Query facility is used by 40 end users in Cancilla's shop. Those users, many of them in management, retrieve up to 40,000 records in a single query. With the enhanced Datacom/DB, "the overhead is not that noticeable. It does not degradate processing at all." Cancilla said he would like to see Data Query more closely integrated with ADR's data dictionary.

ADR's pipelining enhancement, whereby a series of data base updates are held in a main memory buffer for updating all at once, initially caused a problem for Fremont Indemnity. "Their pipeline had a leak in it. When we first got it, it had a gaping hole that poured data out of the machine. It just disappeared," Cancilla said. The company has since fixed the glitch to Cancilla's satisfaction.

The Compound Boolean Selection Facilities of Datacom/DB 7.4 were well received by Cancilla's programmers.

Robert Burkhalter, data base administrator at the Independent Life Insurance Co. in Jacksonville, Fla., began using Release 7.4 of Datacom/DB in April. The company's two IBM 3033 mainframes were at the saturation point, so the DP shop agreed to become an early user in the hope the performance improvements would forestall the need for replacement hardware. The Independent Life DP shop has heavy on-line transaction processing and batch processing demands.

While the enhanced Datacom/DB has extended the useful life of the company's mainframes, Burkhalter said, "we'll still need a machine at the same time. The difference is we'll have more being processed at that time."

The Boolean facilities feature was praised by Burkhalter, who said it significantly reduces I/O and thereby improves performance.

Haydon Gaines, manager of data administration at Equitable Life Leasing Corp. of San Diego, a company that leases computer equipment mostly to Fortune 500 firms, began using Release 7.4 of Datacom/DB a month ago. The company has an IBM 4341 Group 2 with 8M bytes of main memory. The DP center is transferring its processing to the mainframe from Honeywell, Inc. and Digital Equipment Corp. processors that belong to two firms that were merged two years ago to form Equitable Life Leasing.

The company has 25 terminals on-line in the production environment, with plans for another 100 to go on-line from the home office and sales offices and another 29 eventually from branch offices.

All applications are now being written in Ideal, a total of 800 so far, Gaines said. "In one year, we put together a system with 15 programmers that would have taken 100 programmers two years to do in Cobol," Gaines said.

Equitable Life Leasing has had only one problem with the updated Datacom/DB since having it installed. "If we read a file three times, and it didn't find what it wanted, it locked up the data base." ADR technicians responded quickly and fixed the bug within two days, he said.

One suggestion for further improving Ideal would be to offer more than three pages of help information per screen, Gaines said. To provide for its own sophisticated Help system, Equitable Life has written its own code to provide the maximum number of Help screens users require, he said.

On the whole, Gaines is happy with the Datacom/DB enhancements. "There's a few little quirks to work around, but the nucleus is pretty solid," he said.

— John Desmond

ORACLE

The portable version of IBM's DB2 and SQL/DS

COMPATIBILITY

The ORACLE relational database management system is fully compatible with IBM's SQL/DS and DB2. SQL/DS and DB2 represent IBM's latest generation of database management technology for IBM's largest computers. ORACLE's capabilities and user interface - the SQL language - are identical to those of SQL/DS and DB2. Programs written for SQL/DS and DB2 will run unmodified on ORACLE.

PORTABILITY

SQL/DS and DB2 run only on IBM mainframes; ORACLE runs on IBM mainframes, DEC, DG, AT&T, HP, STRATUS, and several other manufacturers' minicomputers, and on a wide range of microcomputers including the IBM PC/XT and PC/AT. All versions of ORACLE are identical and include a complete implementation of SQL – not a subset.

CONNECTABILITY

Having the same software running on your mainframe, minis, and micros greatly simplifies the task of connecting your machines into a network. ORACLE's network software allows microcomputer users to directly access data stored in the shared database on the mainframe or minicomputer, or copy that data into the database on their micros and operate independently.

Oracle introduced the first relational DBMS and the first implementation of SQL back in 1979. Today, eight of the ten largest U.S. companies use ORACLE. In fact, INC MAGAZINE ranks Oracle as the fastest-growing software company in the USA. Surprised? Don't be. ORACLE is the number one relational DBMS, with thousands of installations on IBM mainframes, DEC, DG, AT&T, HP, STRATUS and most other vendors' minis and micros. Even the IBM PC.

To attend the next free, half-day seminar in your area or receive additional information, write Oracle Corp., Dept. C4, 2710 Sand Hill Rd., Menlo Park, CA 94025, or call 415/854-7350. Following is the ORACLE seminar schedule:

ORACLE Seminar Schedule

Randall L. Tobias

CW PHOTOS BY GODFREY O'CONNELL

AT&T is feeling the growing pains of divestiture everywhere, most recently in last month's announcement to eliminate 24,000 jobs in the Information Systems division. AT&T Communications, the company's long-distance services arm, has been plagued by delays in its private-line installation, by increasingly competitive players like MCI Communications Corp. and by its perpetual lobbying against the remaining shackles of government regulation.

In the center of the AT&T Communications storm is Chairman and Chief Executive Officer Randall L. Tobias, at 43, the youngest member of AT&T's top management team. A 21-year Bell system veteran, Tobias was promoted to his current position from senior vice-president of AT&T, where he specialized in regulatory and legislative policy issues.

Interviewed by Computerworld staff writer Clinton Wilder recently in his office at AT&T Communications headquarters in Basking Ridge, N.J., Tobias shared his views on the Federal Communications Commission, the partnership between IBM and MCI, equal access and competition for the business and residential long-distance market.

You have been quoted as saying that the long-distance marketplace is now a competitive one. But your competitors insist that it is not, since AT&T still has an enormous market share. In long-distance market share figures, [GTE Sprint Communications Corp. President] Don Prigmore in a recently published forum on deregulation charged that AT&T had a 90% market share, while you maintained that it was only 64%.

Market share isn't even relevant. Market share suggests that you have the ability to do certain things, whereas it is really market power that is significant. Regardless of our market share, we don't have the market power that would permit us to do the kind of things that people in some corners accuse us of.

But people, including yourself, still use those numbers.

Our number, the 64% figure, is based on the traditional definition of long-distance service.

Yet Prigmore and others like to ignore that definition and say, "No, that's not what we're talking about; we're going to define the long-distance market differently."

My parents live in rural Indiana. For all I know, we have 100% of the market there because nobody else is willing or interested in serving those markets.

If you look at certain high-profit segments of the market, then our market share is much lower where there is particular price sensitivity. What's the relationship between lower market share and competitors passing along only part of subsidy? That's not because our [lower priced] competitors are passing along real savings. They are passing along only part of the subsidy that they get because of the discount in access charges. But they are siphoning off some of that subsidy and keeping it for themselves. It is the American public that's getting gouged as a result of all that.

If you were truly deregulated, what assurance would there be that rural Indiana would still have complete long-distance service, if it's not a profitable enough market to be in?

Oh, I think it's profitable enough to be in. The issue of abandonment of markets is an issue that I think a lot of people in rural communities used to be concerned about, but I don't think they are concerned about it particularly any more. A lot of the [digital, fiber-optic] technology kind of makes that problem go away. We just established telephone service to Pitcairn Island in the Pacific. That is a very good example of something that did not cost much to do because of the nature of the technology that is already there. We hooked some links together, and it was no big deal.

There is also the perceived threat of price deaveraging. I don't know where prices are likely to go, but one thing I am pretty certain about is that whatever changes are made, they are going to be made on the basis of volume, not geography, because that's where the real cost trade-offs are.

I recently asked [MCI Communications Corp. Chairman] Bill McGowan to respond to your published comments about deregulation in light of the IBM-MCI hookup. His response was that IBM owned all of Satellite Business Systems [SBS] before the deal and now has only 16% of MCI, so he was trying to downplay it. How do you respond to that?

I think the facts are self-evident. First of all, you have a company, in IBM, that . . . is not a newcomer to the information business or the telecommunications business. Here is a company that has looked around at the opportunities and decided to build a relationship with MCI. With that, it can take its traditional business, the [Rolm Corp. private branch exchange] business that it's purchased, and what they had in SBS, plus MCI now, and leverage all of that in the marketplace.

Here's a company that's bigger than AT&T, that's got all of these strengths. It is just ludicrous to me that somebody would say that because we didn't change our name — because when we were the Bell system we were called AT&T — that we ought to continue to be fettered with the regulations that may have been appropriate for the Bell system when it was called AT&T. [Regulation] clearly no longer makes any sense for a company that isn't even the biggest company in this whole information movement and management business.

In terms of the technical directions that you would like to move in the data communications market, how is [the Federal Communications Commission's] Second Computer Inquiry keeping you from doing what you would like?

In code and protocol conversion, [Computer Decision II] addresses something called enhanced services, and nobody knows what that is. It is based on a premise that says you can divide the world up and put it in nice, neat, little packages — data processing is here and communications is here — and, therefore, you can't do certain things under the provisions of [Computer Decision II].

As a result of those prohibitions, the marketplace and the consuming public are kept from the benefits of things that we know about . . . and from the benefits of things that we don't even know about because there has been no way for those synergies to be developed. I don't think we even know what we are missing.

[Computer Decision II] was established at a time when there was concern about the Bell system and its ownership of local dial tone and the alleged bottleneck associated with it. Then the divestiture came along and solved the problem more permanently than [Computer Decision II] did.

I am often asked if I am pleased that the FCC appears on the verge of doing something about [Computer Decision II]. [The answer is] "yes," except it is hard to be excited about something that should have been eliminated on Jan. 1, 1984, if not before.

What do you think about the speed at which FCC Chairman Mark Fowler is bringing about deregulation?

I understand the political problems, and I understand the realities and all of that, but when you're bleeding to death, it's hard to have a lot of patience with problems that should have been resolved a long, long time ago.

We are trying, for example, to introduce a service called Proamerica [targeted at] small businesses. Anybody else in the marketplace that wants to introduce their version of Proamerica could decide this afternoon they wanted to do it and have it in the marketplace tomorrow. We introduced it in April, filed the petition with the FCC and we still don't have permission to put it in.

I don't understand how that is possibly in anybody's interests, other than perhaps some competitors whose interest is served by keeping prices artificially high in the marketplace.

Do you think the current equal access plan will work?

I think it will work because all the players are going to work hard to make it work, at least speaking for us. But do I think it's a good idea? That's a different question.

A very large percentage of our customers understood the rules to mean that if you are happy with what you have, you don't have to do anything.

So for the government to come along and say that it is now going to make that decision for you, and after the public's been jerked around so much in all this transition . . . I am disappointed

See TOBIAS page 9

TEXACO

from page 1

air-conditioning and power load requirements, without which we would have had to do some major building improvements, the physical space itself — the footprint — and the increased level of error handling and recovery," McDonald reported.

More than 12 mainframes

Texaco, which was one of several companies to receive the dual-processor Model 200s last week, has more than a dozen mainframes dispersed throughout two major data centers here and in Tulsa, Okla. The company plans to add at least two, and possibly three, Model 200s by the end of 1985 and plans to upgrade the Model 200s to quadratic processor Model 400s when those systems become available in late 1986 or early 1987. Texaco's first 3090, acquired under a third-party lease, was ordered in February when the 3090 line, also known by its development code name Sierra, was announced. McDonald said the 3090s will gradually replace combinations of IBM 3080-type systems.

"In an interactive environment," he added, "there are a couple of things going for the 3090, including the extended storage. We are hoping for a lot faster response, although we haven't figured it out exactly. There are always a large number of potential bottlenecks standing by making sure you don't get the response rate you hope for in the early going. It may be channel paths, communications lines or anything. We do anticipate a 10% improvement over the main CPU ability in the 3080s. It will probably take us two weeks to adjust our parameters and get full performance, which will be just about the time that the next 3090 rolls in the door."

The first Texaco machine contains an extended memory of 128K bytes, rather than the standard 64K bytes, and runs under IBM MVS/XA. It is being placed in an IBM JES3 multi-CPU environment using IBM TSO. That environment, supporting the Interactive Computing Center, is in use at both data centers, as is a second environment, IBM's JES3 IMS, which supports transaction processing such as payroll, personnel and financial applications.

The Interactive Computing Center is an information center-based concept under which Texaco provides decision support to managers and technicians through its multiple 3090 and 3080 mainframes running a variety of data base management systems and connected by an IBM Systems Network Architecture network.

According to McDonald, the only software changes required to prepare for the 3090's arrival involved upgrading two components of MVA/XA — an error recovery routine and the XA nucleus itself — to a higher release level.

He said that the autodial facility, in which the 3090 "does like E. T. and phones home when something goes wrong," allows the system to notify automatically the operator and telephone an IBM service center when the computer has a technical malfunction.

McDonald said that feature does not present a security problem because the feature provides no access to the data path.

McDonald noted that the specifications for the Model 200 list its footprint as 452 sq ft and weight as 13,000 lb, compared with 657 sq ft of floor space required for the 20,000-lb IBM 3084.

He reported that space for his 3090 was cleared over the course of several months as Texaco upgraded its banks of disk drives.

TOBIAS

from page 8

in that from a public policy view.

Is the Integrated Services Digital Network [ISDN] really a key goal for AT&T, or will communications technology eventually evolve to all-digital anyway?

No, I think our strategy is fundamentally one that accommodates ISDN, and I think that it's very important. I think that we've got to have connectivity that finds the world as it is and makes it as transparent as possible.

If AT&T Communications faces the same type of competition and profitability pressures as AT&T Information Systems, what assurances are there that you might not have to undergo the same kind of job cut?

We've got to be, in my judgment, the low-cost supplier in the marketplace. That means we have to be constantly reexamining the cost structure to determine how we get this job done better with less cost.

Having said that, we do not foresee, either now or in the future, a need for the kind of people-oriented downsizing across the board in the organization in communications that we're all dealing with now in AT&T Information Systems.

That is not to say that we won't have pockets of surplus here and there around the organization. We have 120,000 people here, and I think it would be foolish to think that there won't be places in which we will find ways to do things more efficiently, and there will be people impacts.

In conclusion, I obviously wouldn't ask you to assess your chances, but would you like to replace [AT&T Chairman of the Board] Charles Brown someday?

That is not one [area that] I spend a lot of time thinking about. We have the good fortune here of having a very capable senior management team, and I have a lot of confidence in all of those people. I think one of the strengths of this organization is that we do not spend any time worrying about that kind of an issue.

CICS for the COBOL Programmer
Part 1: An Introductory Course

If you're working with CICS...as a manager, a trainer, or a COBOL programmer...you should get a copy of *CICS for the COBOL Programmer, Part 1: An Introductory Course.*

Why? Because this book zeroes in on the basics of CICS, leaving aside the features you won't use right away.

So beginners can use it to learn CICS without getting bogged down in a lot of detail. Experienced CICS programmers can use it to gain a better understanding of CICS that will help them produce more efficient programs. And everyone in your shop can use it as a reference manual to save time and coding errors.

Here's just some of what you'll find in this book:

- the meanings of the critical terms and concepts that apply to CICS
- how to use basic mapping support (BMS) macros to create a mapset...the special assembler program that defines screen formats for a CICS program
- 4 CICS terminal-handling commands that let COBOL programs communicate with 3270 terminals
- 5 CICS file-handling commands that let COBOL programs access VSAM key-sequenced (or ISAM) files
- 3 CICS program-control commands that let you transfer control from one COBOL program to another
- pseudo-conversational programming ...what it is, why you have to use it, and how it complicates the logic in a COBOL program
- why program efficiency is vital under CICS...and how to write programs that make the best use of your computer's resources
- how to design a *structured* CICS program
- how to test CICS programs using top-down testing
- how to debug CICS abends using either the Execution Diagnostics Facility (EDF) or a storage dump

4 reasons why this book works

1. To learn CICS programming, you have to grasp several complex concepts all at the same time. This book works because the author, Doug Lowe, carefully explains how each of these concepts relates to the whole.

In contrast, most courses present each CICS element separately, without showing relationships. No wonder so many people are baffled by CICS!

2. Doug spent a lot of time choosing a usable—and teachable—subset of CICS for this book. As a result, you won't learn *every* CICS feature...just the most useful ones. And you'll build a solid foundation for learning the additional CICS elements...like alternate indexing, queue management, and terminal paging...that are covered in *Part 2: An Advanced Course.*

3. Doug gives you plenty of coding models in this book...for CICS elements, common COBOL routines, and BMS map definitions. I'm convinced these examples, more than any other factor, will help you understand how the new elements and routines work. And I know your productivity will go way up if you use these models when you write your own CICS programs.

4. Although effective program design is critical to the success of any programmer, I've yet to see a CICS book or course that adequately deals with the subject. In fact, most of them don't say anything about design at all.

In contrast, this book stresses effective, structured design. So you'll learn to break programs down into logical units that are easier to code, test, debug, and maintain.

Why wait? Get a copy TODAY

If you want to know more about how to develop CICS programs...or you need a practical, easy-to-use reference with plenty of examples...get *CICS for the COBOL Programmer, Part 1* TODAY. I think you'll be surprised at how much knowledge and reference material you can get for $25!

Our unlimited guarantee

You must be satisfied. Our books must work for you, or you can send them back for a full refund...no matter how many you buy, no matter how long you've had them.

To order by phone, call 1-800-221-5528 / In Calif., call 1-800-221-5527
(Weekdays, 9 to 4 Pacific Std. Time)

Do you have some questions about VSAM file handling in COBOL?

If so, get a copy of *VSAM for the COBOL Programmer.* This practical, how-to guide will teach you all about using VSAM files in COBOL programs.

That means you'll learn: the COBOL elements for handling key-sequenced, entry-sequenced, and relative-record VSAM files; why error processing is a must for VSAM files; how to use the IDCAMS utility; how to code the DOS or OS JCL for programs that use VSAM files; and more!

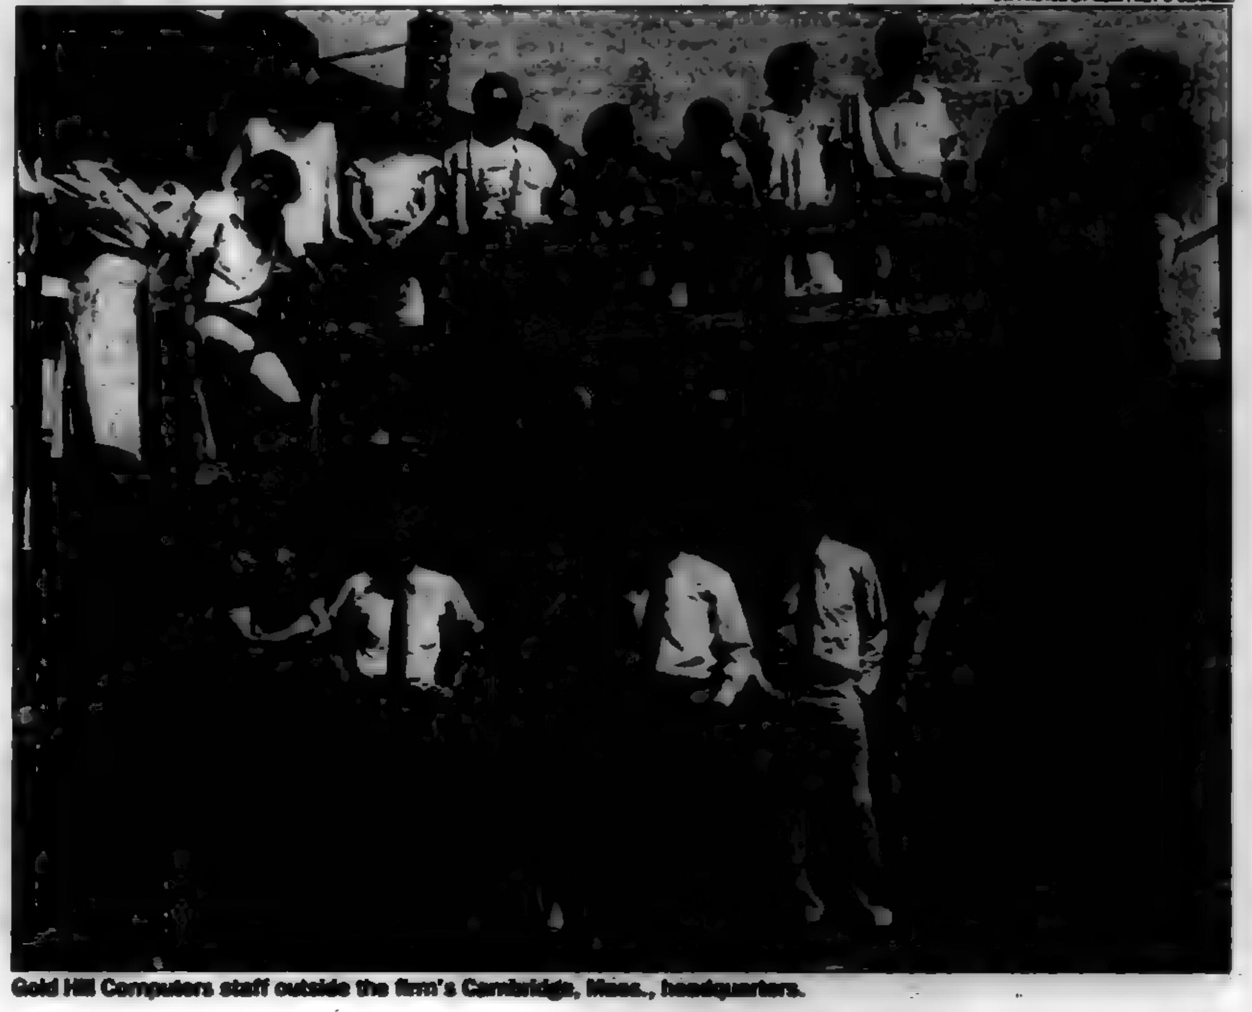
AI firms outgrow seat-of-the-pants style

Professional style ascendant as tools come to marketplace

CW PHOTOS BY GEOFFREY O'CONNELL



Gold Hill Computers staff outside the firm's Cambridge, Mass., headquarters.

By Eric Bender
CW Staff

The offer to join Gold Hill Computers, Inc. as president was tempting, but Carl Wolf came up with one nonnegotiable demand: the bomber flights must end.

Like many other members of the East Coast artificial intelligence community, Gold Hill's vice-president for research and development, Gerald Barber, liked to fly around in a colleague's World War II bomber. As one passenger later joked, if that plane crashed, it would take the U.S. fifth-generation computing effort with it.

Risking prime technical talent this way did not appeal at all to Wolf last spring as he considered the risks of leaving the presidency of Interactive Data Corp. He joined the small AI micro software firm, but he asked that Barber be grounded.

In a small way, Wolf's request demonstrates the way the firms now vying to supply micro-based AI tools are following in the footsteps of earlier entrants in the AI arena, making the transition from seat-of-the-pants to professional management.

And, again like the AI pioneers, they must stay tightly focused on practical uses of the technology. For the moment, "there's a lack of demonstrable, successful applications," Wolf acknowledged, although he and many others predict that the situation will change by early next year.

Gold Hill and Arity Corp., another supplier concentrating on the IBM Personal Computer family that shipped its first products last year, highlight the promise and current status of AI tools on micros.

Wolf

The founders of Gold Hill — Barber, Stanley Curtis (vice-president for consulting and training) and John Teeter (vice-president for engineering) — met as students at the University of Idaho. After holding various jobs in industry and academia, the three started Gold Hill in 1982 to develop AI products for personal computers. Based a few blocks from MIT in Cambridge, Mass., the company is named for Teeter's Idaho farm.

Gold Hill took its technical points of departure for its current products from the Intel Corp. 8086 family, with prime emphasis on the 80286 chip, and Common Lisp, a Lisp dialect then beginning to emerge as a standard under the sponsorship of the U.S. Department of Defense Advanced Research Projects Agency.

Along the way, Gold Hill joined forces with Carl Hewitt and Patrick Winston, two AI gurus at MIT who continue to serve on the company's board. The firm also worked jointly with Symbolics, Inc. last year on a well-publicized knowledge system venture for Shearson Lehman Brothers, Inc., a subsidiary of American Express Co.

The company began shipping Golden Common Lisp, the first Personal Computer implementation of Common Lisp, last November. The package has been sold to approximately 3,000 customers, primarily large corporations, Wolf said.

Gold Hill's initial marketing plan targeted end-user applications as well as development tools. But Wolf, who pointed out that few software firms have prospered by offering both languages and applications, drastically redefined the plan. The main thrust now is to establish Golden Common Lisp as a micro AI standard. The firm will then extend the product line with additional development tools and service offerings.

"The business community is waiting for a [Cullinet Software, Inc.] to come along and help them into AI," Wolf suggested. "We want to be the Cullinet of this industry."

The company currently employs 18 people and has a monthly run rate of about $200,000, Wolf said. "With people like Carl Hewitt and Gerry Barber, we could make a lot more money than this in consulting," he remarked, but the strategy should pay off down the road. Gold Hill's revenue goals are $2 million this year, $9 million next year and $17 million in 1987, he added.

Barber

One key offering, scheduled for commercial availability by year end, is a large-memory version of Golden Common Lisp designed for the Personal Computer AT, which will directly address up to 16M bytes of internal memory.

While the standard Personal Computer offers "acceptable performance for many applications, "the big problem is memory, and I think the [AT] solves that," Barber said. "The AT will be where the action is in AI in a few years — it certainly has the power, and it's going to be everywhere."

Barber predicts a turn toward networked development environments, with ATs hooked to dedicated Lisp machines, as at Gold Hill. "Symbolics is never going to build a workstation as cheaply as IBM," he commented. A network supporting Common Lisp on all nodes will permit developers to do much of their work on the AT, then send it over to the dedicated machine for compiling and other CPU-intensive tasks, he said.

In another major step, during first-half 1986, Gold Hill will move into the expert systems shell arena. "Our market research tells us there are two to 10 times the number of people willing to program at this level as are willing to program in Lisp," Wolf commented. "It's a much, much bigger ball game."

Here, Gold Hill will compete with AI software pioneers such as Intellicorp, the Carnegie Group, Inc. and Teknowledge, Inc.

The approach will be to offer products that are not as powerful but that are easier to develop and maintain, Wolf said.

While many firms are offering AI languages on personal computers, Wolf listed three main competitors: Lucid, Inc., Expertelligence, Inc. and Arity. Among those, only Arity has targeted IBM micros.

Located in Concord, Mass., about 20 miles west of Gold Hill's headquarters, Arity was started by Lotus Development Corp. alumni. President Peter Gabel, who has also flown on that bomber, was an early Lotus employee and subsequently ran Lotus'

Advanced Development group. Arity R&D Vice-President Paul Weiss was a member of the group.

The two formed Arity in the spring of 1984. The company's first commercial products, a Prolog interpreter and a compiler/interpreter package, shipped last April.

Gabel, left, and Arity Vice-President for R&D Paul Weiss

Arity adhered to the Prolog core defined by a standard computer science textbook while modifying it for the Personal Computer, Weiss said. The firm also put in a series of extensions for tasks that traditional Prolog does not do well, including the handling of text strings.

The Arity packages also offer hooks to C and assembly languages for the 8086 family. "This distinguishes us from a lot of [personal computer] companies," Gabel pointed out. Another difference is that Arity will not charge royalties on runtime versions. "If Prolog is to become more successful, it must be more commodity-like," he maintained.

While software vendors represent the largest group of Arity customers, classic DP shops run a close second, according to Gabel. Particularly in insurance firms and banks, these shops are building micro packages designed to provide intelligent interfaces to mainframe data. "Prolog happens to be a perfect kind of language to do this," Gabel said. "Prolog has a natural connection to data bases."

One customer — whom Gabel declined to identify — is a leading mainframe data base management system vendor,

NEW YORK — Despite frequent announcements of expert systems, there are few available that can help a financial institution improve its business, said a Metropolitan Life Insurance Co. technical planning official.

Roger J. Jones, planning manager in Metropolitan Life's corporate systems planning division, recently told the members of the Association for Women in Computing that human experts are harder to duplicate than expert system advocates admit. In many cases, it is so expensive to encode the thinking of an expert that a bank or insurance company prefers training its own experts.

"What if the expert lies to you? What if the expert is wrong and just lucked out? What do you do when the business the expert told you about changes?" Jones asked.

These uncertainties are what expert system advocates label "research questions," he said. Some experts are so possessive of their special knowledge or threatened by the prospect of having their skill put into a computer that they covertly sabotage the expert system building process, he noted.

Jones said Metropolitan Life constructed an expert system to perform the underwriting function on personal insurance policies. Underwriters typically evaluate a mass of information about a client to determine the degree of risk he represents to an insurer.

Metropolitan Life's expert system evaluates the information to see if it is sufficient to determine risk, then it decides whether the prospect represents a standard or substandard risk to the company.

The giant insurance company found that it cost more to have someone transcribe 20 to 30 pages of medical information from doctors into the system than it did to have an underwriter evaluate the information the way it came into the office.

In addition, insurance companies are under pressure to use larger pools of cases in determining actuarial tables, which makes an expert system based on today's risk conceptions out of date. Insurers, for example, are shifting away from relying on pools that separate men from women in the actuarial tables.

Jones said the underwriting system was "built as a technical proof. It was never intended to be installed," and isn't currently working as a production model. Metropolitan Life simply made it a corporate objective to

from page 11

which used the Prolog tools to build an expert system that consults on installation of its software. Nearly 100 users have benefited from the expert system, which significantly reduces installation time and errors, Gabel said.

Products from Arity customers will begin surfacing next year, Gabel said. "The leaders are out of evaluation mode. . . . Everyone's fighting to get into development mode."

Unlike the case with Gold Hill, Arity will not design its own method to address directly up to 16M bytes on the AT. Instead it will wait for another release of MS-DOS to overcome the direct-address barrier.

Weiss downplayed the value of a networked development environment, saying that the requirement to port between various machines raises unnecessary problems.

EXPERT from page 12

understand expert systems and commissioned a group under Jones to look for ways to apply them.

After two years of looking, his group concluded: "Nobody's written anything in 10 years that's done anything. All the successes that you read about have been around for a long time."

He cited as examples Prospector, an ore-hunting system developed by SRI International, Inc.; and Dendral, a system developed 20 years ago at Stanford University to identify the molecular structure of compounds from samples.

"The reason they were successful is that they mapped a very broad knowledge base of very simple facts," he said.

Human beings tend to lack the computer's capacity to search huge data bases looking for one pattern or set of facts, he noted.

Even when an expert system does this, the rules or knowledge at the core of it tend to be small, he added.

Jones said MIS administrators should continue to look for ways to employ expert systems at their institutions in addition to improving data processing productivity. If expertise were viewed in a broader sense of a collection of experts knowledgeable about more than one aspect of the business, expert systems might be built that could serve long-range needs, he said.

But until then, most financial institutions are finding it cheaper to simply train human experts, he said.

Police recover hijacked DEC VAXs

By Peter Bartolik
CW Staff

WATERTOWN, Mass. — Two top-of-the-line Digital Equipment Corp. systems were recovered in this metropolitan Boston area community Wednesday after being hijacked two days earlier. A contract driver who reported the theft turned himself into police here Thursday after a warrant was issued for his arrest.

The stolen VAX 8600 and VAX-11/785, both fully configured and valued in excess of $1 million, were discovered in a warehouse here after police received calls from two citizens who said they saw DEC packages being unloaded.

The prime suspect in the case, Robert Dickerson, 48, of Malden, Mass., turned himself in to Watertown police midday Thursday after a warrant for his arrest was issued by the Middlesex County District Attorney's office. Dickerson was a driver for Camel Trucking, Inc. of Chelsea, Mass., a company contracted by DEC to transport the equipment to Logan International Airport outside Boston for air shipment to Nihon Digital Equipment Corp., DEC's Japanese subsidiary. DEC spokesman Jeff Gibson said the company has its own trucking fleet, but often contracts out when its own fleet is being fully utilized.

According to police, Dickerson picked up the truck at DEC's Northboro, Mass., shipping facility early Monday afternoon. He told police he pulled into a nearby truck stop on the Massachusetts Turnpike after experiencing mechanical problems. He reportedly was approached by a man with a gun after he got out and lifted up the hood of the truck. Dickerson told investigators he had been pushed into a van, handcuffed and transported to an out-of-the-way area in Wilmington, Mass., some 20 miles away.

The truck, which did not bear any DEC markings, was recovered in Somerville, Mass., Wednesday morning.

Watertown detectives alleged that Dickerson rented the warehouse space for a short period of time some weeks earlier. Watertown Police Sgt. William Chase told *Computerworld* that the circumstances indicated planning on the part of an undetermined number of thieves and that Dickerson certainly knew the contents of the shipment.

Chase said he was not aware of how the thieves intended to dispose of the sophisticated equipment. "There are people who would take a hot stove if the price was right," he said.

John J. Cloherty Jr., a spokesman for the Boston office of the Federal Bureau of Investigation, which joined in the investigation, discounted early media speculation that the equipment was destined for a Soviet bloc country embargoed by the U.S. from receiving such equipment. Cloherty told *Computerworld* the FBI was "treating the case strictly as the theft of an interstate shipment."

DEC's Gibson said he could not conceive of any manner in which the equipment could be disposed of. "If it was a personal computer or a [DEC] Rainbow I could see it, but how do you get rid of a Venus?" he said. Venus was the code name for the 8600 while in the development stage.

'Gray market is huge'

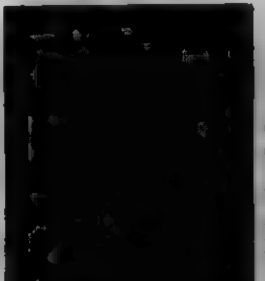
A criminal investigator specializing in industrial security, who asked not to be identified, told *Computerworld* that, "As far as I'm concerned, the gray market is huge and can gobble up anything from a [Cray Research, Inc.] Pentagon-size system to an [Apple Computer, Inc.] Apple, with a VAX someplace in between."

The investigator asserted that Soviet bloc agents "are too sophisticated" to be involved in a case of this type, and, "More likely, it was set up for a domestic buyer."

A company possessing a stolen computer could obtain peripherals, software and services on the gray market or through legitimate non-DEC suppliers, the investigator said. "There have been several cases that I've seen where even banks have ended up with stuff from the gray market only because somebody approached them and said, 'I can get it for you wholesale.'"

OEM Computer Product Buyers

"The Invitational Computer Conferences bring to you the latest high-tech information you need to hear, and the major OEM products you need to see. We'll be there!"



And you'll find other top OEM manufacturers, such as NCR, Fujitsu, Xebec, Lear Siegler, Siemens and IBM, to name but a few.

Celebrating its 15th year, the "OEM Only" ICCs bring you, the volume buying decision makers, together with the key suppliers of computer and peripheral products. The ICCs also bring you a full day of high-tech seminars, explaining the latest in computer product technologies and what they mean to you, the systems design engineer. As an invited guest, there is no charge to attend the seminars or product displays.

The ICCs, a series of eleven, one-day regional conferences are convenient to where you work. The small, exclusive setting makes it easy for you to meet potential suppliers one-on-one.

Hear what the OEM manufacturers have to say, learn about new technologies, and remember, you may attend "by invitation only".

Ken Orr Seminars

INTRODUCING CHASE: COMPUTER/HUMAN-AIDED SOFTWARE ENGINEERING

Some things are best done by computers and some things are best done by people — the trick is to determine which are which. Any tool, no matter how powerful, will fall into disuse without the training and support of the people who are expected to use it. Computer-Aided Software Engineering (CASE) tools are no exception. Ken Orr supplies the critical human know-how in the software development life cycle with a full range of integrated seminars and consulting services. Ken Orr & Associates can help you implement CASE with CHASE — Computer/Human-Aided Software Engineering.

WASHINGTON UPDATE
CW Washington Bureau

DOT plans electronic system for tariffs

WASHINGTON, D.C. — The U.S. Department of Transportation (DOT) recently announced that it plans to develop an electronic filing system for international airline tariffs to replace "an antiquated paper filing and review system that dates back to 1938."

In an advance notice published in the "Federal Register," a daily government bulletin, the DOT said a computerized system would save money for both the airlines and the department, which is faced with an "avalanche" of paper inherited from the defunct Civil Aeronautics Board.

Although the major airlines and tariff filing agents have computerized their tariff data systems, the DOT has not. "As a result, airlines are often in the position of converting computerized fare and rate data into printed form for the sole purpose of meeting the statutory filing requirements," the DOT announcement said.

"The industry is now spending at least $5 million a year to produce, file and distribute paper tariff documents. [The] DOT is spending more than half a million dollars a year just to process the paper," the statement continued.

The DOT said it envisions a system where airlines or their agents would send the data via telecommunications to a central data base. Public comments on the proposal are due Nov. 18.

GSA office markets software, OA services

ARLINGTON, Va. — Tucked away in the U.S. General Services Administration building is an office that acts so much like a private business that it even has a director of marketing to promote its services and distribute slick brochures.

The unit is the Office of Software Development and Information Technology (OIT), which recently held its second annual Client/Vendor Conference here. Much of the conference was devoted to describing the OIT's services to an audience of potential customers — DP professionals at federal agencies.

"We take a business-like approach rather than a bureaucratic approach," commented Rick Dillon, the new OIT director of marketing. The services for government agencies include technical assistance for software management including conversion, maintenance, improvement and quality assurance; developing and managing office automation projects; and systematic planning for information resources management.

The OIT staff is reimbursed for its services by the agency customer, and the goal of the OIT is to produce enough revenue to break even at the end of the fiscal year. Frequently, the OIT helps the agency obtain well-qualified contractors for the job and manages the contract.

Officials were sensitive to criticism from some vendors that the OIT competes with the private sector for government business, a practice that would contradict Reagan administration policy. "We don't compete with the private sector, we create more business for the private sector," Dillon said, explaining that the office is a conduit for vendors seeking agency contracts.

SSA plans Cobol quality control

By Mitch Betts
CW Washington Bureau

ARLINGTON, Va. — The Social Security Administration (SSA), in the midst of its $500-million hardware modernization program, is taking aggressive steps to upgrade the quality of its huge inventory of Cobol software as well, according to Ralph DeAngelus, director of the SSA's Office of Programmatic Systems.

In a recent speech here, DeAngelus outlined several software improvement projects, including the following:

- The SSA held a series of seminars on software improvement for 600 DP professionals.
- The SSA recently ran its Cobol programs through a software alignment tool to standardize alignment. Programmers are now using this tool for new programs, and soon the SSA will not allow a program to migrate to the production library unless it has been run through the alignment tool.
- The SSA initiated a pilot project to acquire and implement a series of integrated tools for upgrading all Cobol software, including tools for converting code to Cobol 74, structuring and testing Cobol code and eliminating dead and obsolete code.

"Our goal is to have a Cobol programmer's workbench installed and in use by the end of next summer," DeAngelus said.

Required to use tools

He added that programmers will be required to use the quality-control tools.

The development and enforcement of quality-control standards is crucial, DeAngelus emphasized. "Without enforcement mechanisms in place, as soon as we started to modify the improved software we would be starting the software degradation process all over again," he explained.

"Once we establish a standard and install a tool to enforce that standard, it will be applied against new software development as well as existing software [maintenance]," he said.

DeAngelus said the agency decided not to have this work done by private contractors. "We need to institutionalize the process in SSA with SSA people.

"We want to avoid another $500-million systems modernization program 20 years from now," he said.

ALUMINUM
3480 Cartridge Cases

Model No.	Capacity
5101	1 to 10 Cartridges
5105	1 to 26 Cartridges
5106	1 "20 Pack" Tray
5109	1 to 32 Cartridges Includes 2 removable trays 16 capacity each
5129	1 to 64 Cartridges Includes 4 removable trays 16 capacity each

All cases have individual compartments for cartridges except #5106 which holds one tray.

Dartmouth offers Ph.D.

HANOVER, N.H. — Dartmouth College is instituting a doctoral program in computer science.

Ten students each year will be admitted to the program, beginning in September 1986. Students will need four to six years to complete the requirements, which include course work, research, certifying exams and a thesis.

The graduate program will range from hardware and computer architecture concentrations to theoretical studies of algorithms and formal languages. Dartmouth will also offer an M.S. degree in computer science.

The doctoral program's faculty will be drawn from the Department of Mathematics and Computer Science and the Thayer School of Engineering at Dartmouth.

SAS Institute Inc. Announces

Lattice C Compilers for Your IBM Mainframe

Two years ago...

SAS Institute launched an effort to develop a subset of the SAS® Software System for the IBM Personal Computer. After careful study, we agreed that C was the programming language of choice. And that the Lattice® C compiler offered the quality, speed, and efficiency we needed.

One year ago...

Development had progressed so well that we expanded our efforts to include the entire SAS System on a PC, written in C. And to insure that the language, syntax, and commands would be identical across all operating systems, we decided that all future versions of the SAS System—regardless of hardware—would be derived from the same source code written in C. That meant that we needed a C compiler for IBM 370 mainframes. And it had to be good, since all our software products would depend on it.

So we approached Lattice, Inc. and asked if we could implement a version of the Lattice C compiler for IBM mainframes. With Lattice, Inc.'s agreement, development began and progressed rapidly.

Today...

Our efforts are complete—we have a first-rate IBM 370 C compiler. And we are pleased to offer this development tool to you. Now you can write in a single language that is source code compatible with your IBM mainframe and your IBM PC. We have faithfully implemented not only the language, but also the supporting library and environment.

Features of the Lattice C compiler for the 370 include:

- **Generation of reentrant object code.** Reentrancy allows many users to share the same code. Reentrancy is not an easy feature to achieve on the 370, especially if you use non-constant external variables, but we did it.
- **Optimization of the generated code.** We know the 370 instruction set and the various 370 operating environments. We have over 100 staff years of assembler language systems experience on our development team.
- **Generated code executable in both 24-bit and 31-bit addressing modes.** You can run compiled programs above the 16 megabyte line in MVS/XA.
- **Generated code identical for OS and CMS operating systems.** You can move modules between MVS and CMS without even recompiling.
- **Complete libraries.** We have implemented all the library routines described by Kernighan and Ritchie (the informal C standard), and all the library routines supported by Lattice (except operating system dependent routines), plus extensions for dealing with 370 operating environments directly. Especially significant is our byte-addressable Unix®-style I/O access method.
- **Built-in functions.** Many of the traditional string handling functions are available as built-in functions, generating in-line machine code rather than function calls. Your call to move a string can result in just one MVC instruction rather than a function call and a loop.

In addition to mainframe software development, you can also use our new cross-compiler to develop PC software on your IBM mainframe. With our cross-compiler, you can compile Lattice C programs on your mainframe and generate object code ready to download to your PC.

With the cross-compiler, we also offer PLINK86™ and PLIB86™ by Phoenix Software Associates Ltd. The Phoenix link-editor and library management facility can bind several compiled programs on the mainframe and download immediately executable modules to your PC.

Tomorrow...

We believe that the C language offers the SAS System the path to true portability and maintainability. And we believe that other companies will make similar strategic decisions about C. Already, C is taught in most college computer science curriculums, and is replacing older languages in many. And almost every computer introduced to the market now has a C compiler.

C, the language of choice...

C supports structured programming with superior control features for conditionals, iteration, and case selection. C is good for data structures, with its elegant implementation of structures and pointers. C is conducive to portable coding. It is simple to adjust for the size differences of data elements on different machines.

Continuous support...

At SAS Institute, we support all our products. You license them annually; we support them continuously. You get updates at no additional charge. We have a continuing commitment to make our compiler better and better. We have the ultimate incentive—all our software products depend on it.

For more information...

Complete and mail the coupon today. Because we've got the development tool for your tomorrow.

SAS Institute Inc.
SAS Circle, Box 8000

WORLD DIGEST

CW International News Network

TOKYO — Hitachi Ltd. has announced that it received orders for its Model S-810 supercomputer from the Meteorological Agency and Okazaki Kokuritsu Kyodou Kenkyu Kikou Bunshi Kagaku Laboratory, which is a national Japanese molecular research laboratory.

Increased use of supercomputers is evident this year, and the Japanese market is becoming more competitive among Fujitsu Ltd., Hitachi, NEC Corp. and Cray Research Corp.

Hitachi only shipped its first supercomputer in October to Tokyo University. Since then, six of the company's supercomputers have been ordered for installation in Japan.

DAQING, China — The Ministry of Petroleum here has recently ordered five Control Data Corp. Cyber 180 computer systems and supporting software. The systems will be used for reservoir simulation, computer-aided design and manufacturing surface construction and oil field management in Zhongyuan, China, and Daqing, where more than half of China's petroleum is produced.

Included in the sale is CDC's Geomaster software program for petroleum exploration and seismic data processing. The new systems are valued at $30 million and are scheduled to be installed by December, according to CDC.

SYDNEY, Australia — A $6 million order for point-of-sale equipment has been placed by Burns Philp and Co. in an initial move to link 71 stores here. The contract called for the Handi 25 system from ICL Australia Pty. Ltd. The system consists of Handi 25 systems with 320K bytes of memory and 130M bytes of disk storage. Each store will link about four cash registers and two office systems. ICL pricing printers and standard printers will also be installed.

TOKYO — AT&T Unix Pacific Co., a subsidiary of AT&T of the U.S., has recently signed an agreement here with Nippon Unisoft to develop bilingual capability on AT&T's Unix System V operating system. The product would enable Japanese users to interface with Unix System V, using either Roman characters or Kata-Kana, a phonetic alphabet commonly used in Japan.

The software will be developed in Japan on AT&T 3B2/400 supermicrocomputers and will be made available with Japanese documentation. Plans are under way to license the software worldwide on AT&T's 3B computer line through Japanese distributors.

SYDNEY, Australia — International Data Base Management Association (IDBMA) and *Computerworld Australia* have announced an agreement whereby *Computerworld* will represent IDBMA's computer-based "Pick Spectrum" trade shows in Hong Kong, Singapore and Japan. *Computerworld Australia* is the Sydney-based sister publication of *Computerworld* of the U.S. Show dates have not been set, but it is expected that the first will be held in Hong Kong in 1986.

[illegible], England — Applied Computer Techniques Ltd., maker of the Apricot microcomputer, revealed financial results for the 1984 fiscal year: pretax profits increased 129%, from $6.6 million in 1983 to $12.9 million in 1984. During that period, sales rose 82%. Insiders said exports were up, and production on the Apricot has increased from 4,500 to 6,500 systems per month.

Artificial? Or intelligent?

One of those magical moments that we all eagerly await in the diurnal continuum of modern technology is the point at which a buzzword becomes a reality. So it is that we watch the steady progress of the concept of artificial intelligence, so far a buzzword, soon . . .

Artificial intelligence, or AI as buzzword users worth their salt refer to it, was last year's hot button, a subject that flitted through the ether and caught the fancy of technical users and the public alike — especially the public, and especially that segment of it that works for media similar to, uhm, *this* one. People dearly wanted to believe that all of their *2001* fantasies could come true and that machines could be made to think and act like humans and to relieve humanity of whatever odious routine it cared to slough off. And certain quarters of the computer industry, seeing boom times turn disturbingly bust-like, were not averse to holding out the promise of hardware and software that could — and *would* — do just that, in just a matter of months.

Too much was said, and written, too soon. The reality is that artificial intelligence will always be whatever new computer technology is down the road, just out of reach, barely in sight. Twenty years ago, for example, spelling checkers were considered artificial intelligence. Ten years ago, icon-based interfaces were exotic stuff. What *is* important is that users, and the media, sort through the welter of AI-type developments at any given time and focus attention on those that seem most promising in terms of use and practicality.

Sorting through these developments, some key highlights are the dramatic price/performance improvements in dedicated AI workstations, moves toward language standards and the emergence of better links to traditional computer functions. The most tangible near-term developments likely to emerge from this activity, the ones that will appear to move computer applications forward most dramatically, are expert systems: software tools that draw upon human experience to expedite certain sophisticated, yet routine, job functions.

Users have a great interest in — and, more important, a genuine need for — expert system programs to capture the expertise of retiring professionals, to compensate for talent shortages and to help meet emergency production situations. Such systems also could improve business efficiency as friendly front ends to corporate data bases and as spreadsheet templates. Expert systems fill a critical need, and vendor concentration of development tools for business use is to be applauded.

Demand for these products, however, must come from the corporate users. DP staffs can't, of course, turn their attention away from their critical day-to-day functions to focus exclusively on new AI technology, however intriguing that may be. But DP executives do need to keep a close eye on the technology, which promises tremendous payoffs somewhere down the road.

The road will be a long one. As AI gurus often note, in many ways AI can be viewed as a weak technology, often very difficult to apply to problems that seem fairly straightforward. For many systems, successful commercial implementation will take years of work. But at the end of that long road, DP must be there to help merge the new systems into the corporation's overall information management structure. Managers can begin today, by investigating the products that are available or under development, by steering clear of the buzzwords and nurturing the reality.

Smart building research misleading

In reference to the article, "Demand low for smart buildings" [CW, June 17], it is always interesting to read market research reports. You often wonder if they want a particular answer before they start or whether they asked the wrong question. In this case, they asked the wrong question.

When many people are asked about the need for computers, they answer negatively. Does that mean that the demand for computers is low? Quite the contrary. Asking tenants and developers if they want shared services is like asking people if they want shared bathrooms or shared socks. The answer is obvious.

However, if you ask if tenants want their telecommunications systems to be capable of growing from a few lines to thousands, if they want little capital expense, enhanced services, better training and telecommunications management support, on-site technical maintenance and better control of long-distance calls, the answer is an overwhelming "yes." If you ask developers if they want better leasability, revenue potential and lower operating costs, they also answer "yes."

The bottom line is that these technologically enhanced buildings are here. In fact, the question is not if or when but how fast. Currently, professionally managed and marketed intelligent buildings are achieving 90% leasability in high-vacancy markets. This reflects the true definition of an intelligent building — one that is fully leased.

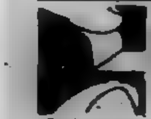
VIEWPOINT

For every slump, there's a silver lining



WOHL STREET
[illegible]
Amy Wohl

Everyone knows the computer industry is in a slump. Each day brings more bad news. The biggest and the best report that profits are down. The telephone industry boys who were all set to challenge IBM for the information systems vendor crown cut 24,000 staff positions.

Everyone blames the slump for everything. Customers don't buy your products? Blame the slump and not your development department's failure to predict market requirements. Market share changes? Blame the slump (I thought we were all in the same market). Products slip their schedules? Blame the slump (Why?). Can't get venture capital? Blame the slump and not the fact that your bright idea or the management team you propose to run with it aren't worth investing in.

Boring. You're tired of reading articles like that about the computer slump, and I'm tired of writing them. Isn't there something more creative to do?

It was refreshing to meet an old friend, a seasoned computer industry professional who is currently heading a major minicomputer company. He suggested that slumps are really excellent business opportunities for those who know how to take advantage of them. "We get fat and happy and a little careless when things are going well," he said, "and it's darned hard to fix that when you're making lots of money."

But how do you take advantage of a slump? "Well," he continued, "it's a great opportunity to get rid of people and projects you never should have taken on in the first place." No need to say anything unpleasant; just blame it on the slump.

Fascinated, I asked him to continue. He described his current plan of action:

- Get rid of anything that isn't making money now and probably won't any time soon. Look particularly for projects that were started as someone's pet, projects that have a huge staff and no results and projects that are significantly behind schedule and may no longer be in their marketing window when and if a product ever emerges.
- Don't start projects that don't make economic sense. Look at projects that are someone's pet, projects that need big budgets and projects that don't seem to have a strong basis in customer needs or a strong fit with what your firm does best. The slump and your firm's need to husband any existing surplus will be an adequate, impersonal explanation of your inability to approve the project.
- Use the slump as a way of revitalizing your employees. Change them back into the lean, mean and successful team that started your company. Everyone can understand the importance of team effort and working hard when times are tough.

By using a slump creatively, you can come out of the slump at top speed, ready to take advantage of the business growth that will surely follow.

Note that a significant feature of this slump is the number of computer companies now in the industry, and adversely affected by the slump, that haven't lived through this problem before. Maybe they managed to escape the last computer industry downturn, or maybe they're so young that they've never lived through one before. If you've known only good times, you can't be experienced in wise behavior for the bad times. So a great deal of the howling and screaming is simply because of inexperience.

Experienced companies are following my friend's example:

- Cut back as soon as you recognize the need to. Don't wait; it will only make things worse.
- Make the initial cutbacks bigger than you think you'll need. No one will ultimately remember that you cut the work force by 18% instead of 16%, but everyone will remember that you had two layoffs instead of one. You can always announce that you're rehiring — that's good news.
- Get rid of all the deadwood. You won't have another chance. If you fail to do so, it may mortally wound your company; if you fail to do so and live through the slump anyway, you'll never get rid of deadwood when things are going well.
- Make everyone share the burden. You can't ask the administrative staff to work extra hard and count the paper clips while you continue to call for management meetings in Hawaii.
- Don't cut back on the very things that will build your future. Try to hold on to the money for research and development, product planning and management and anything that supports your customer relationships, such as service, support, users groups and market research.

And how should a user organization make hay during bad times? By using the downturn as a filter, measuring how its current or prospective vendors behave. If they act like grown-ups, clean up their mistakes and look to the future rather than crying about the past, you'll like them; if not, you will have learned something useful. It is also a good test of their financial viability: Good vendors should have a backlog and some contingency plans to get them through bad times.

Of course, user organizations will want to see exactly what vendors are chopping off. It might just be the very product you were interested in, in which case you may need to change vendor plans.

And you'll want to take advantage of bargains. Vendors that are trying to build a better bottom line for the current quarter turn into real deal makers. Users should be able to get better discounts, additional support or better guarantees and better information about future plans. Vendors really need users in a downturn — sometimes they forget this when times are good. This is the users' turn to get what they want and need. Caution: Do remember that if you cut deals too sharply, you will simply contribute to the nonprofitability of your vendor — and nonprofitable vendors become nonvendors.

So consider the computer slump to be a hidden opportunity for vendors, a chance to get things in hand, a time to keep what's good, to throw out what's not and to prepare for a bright future. For users, it's a golden opportunity to measure the vendors' mettle, to look for new relationships on terms you select and to get an occasional bargain from a temporarily distressed, but sound, supplier.

Who said dark clouds don't have silver linings?

Pitting U.S. hackers against Japanese technology

READER'S PLATFORM
Jon R. David

The economy of this country is being severely strained by a large and ever-growing negative balance of trade. Recent figures gave an imbalance of minus $7 billion last year in the electronics industry. When I see how many of my own purchases of TVs, hi-fi systems, videocassette recorders and the like are Japanese, I wonder how long it will be before Japan is the major computer force in the world.

If the Japanese computer industry offers products that are equivalent in price and quality to Japanese electronics equipment, how can the U.S. computer industry remain the international leader?

Although it seems we cannot compete with Japanese manufacturing, the same writings that laud Japanese production point out that the Japanese do not create, they very efficiently copy, and programming is truly creative.

Some of us are not particularly adept at programming. Others, however, are naturals at this contemporary art form; their achievements are astounding, and their potential is beyond comprehension. Some of these gifted few are known as hackers and are stirring up quite a bit of trouble and attention.

These troublemakers fool around with supposedly secure data bases, use computer and telecommunications resources of public and private businesses and services without paying for them and the like. Although there are very few reports of any actual damage being done, the horror of what these hackers might do has inspired legislative acts directed against hackers, typically making their actions criminal.

Now, although I really don't want some teenager messing around with my bank accounts, I recognize the talent and ability requisite for doing so. Not only do I admire that talent, I want to put it to use, for me, not [inadvertently] against me. Moreover, I think that hackers show the creativity that will enable U.S. computer systems to maintain our country's position as world leader in the computer industry. We have to find these unique talents and get them working for us.

Seek out hackers

Over the years I've worked with a few of these computer freaks. Most of them best like interacting and working with others of their ilk. Rather than shutting down these gifted individuals or putting them into hiding, we should seek them out and get them working together on things that are worthwhile. This, however, is not the easiest thing to do.

Possibly the best way to do this would be to create test systems, networks, data bases and the like. These, created by government agencies, computer manufacturers or whomever, would contain the most sophisticated security devices available. As part of a national test, awards could be given as higher levels of security are breached. These awards could be financial but could also be months of free computer use, a certificate or a plaque.

Additional awards could be given to security breachers who can come up with better security at the levels they breach. The important thing is to give these people a challenge in an environment in which they cannot cause damage to exhibit the talents our industry so sorely needs. Once we identify them, the problem becomes one of harnessing all that ability.

Next, we need a work methodology to keep these people happy and productive. How we do it doesn't matter and will vary greatly, depending on the individual and the situation, but the important thing is to keep these people interested and productive.

Rather than legislating away these hackers, we must recognize their abilities and potential and direct our attention to fostering them and getting them to work in ways to maintain our creative edge in the computer industry. Since we can't seem to compete in equipment manufacturing, these people are the best hope of the U.S. computer industry.

David is a telecommunications consultant based in Tappan, N.Y.

THE SAS®

Fourth Generation Software

Now there's one software solution for all your Information Center needs. One solution for all your applications, for all your mainframes, minicomputers, and microcomputers. One solution—the SAS® System.

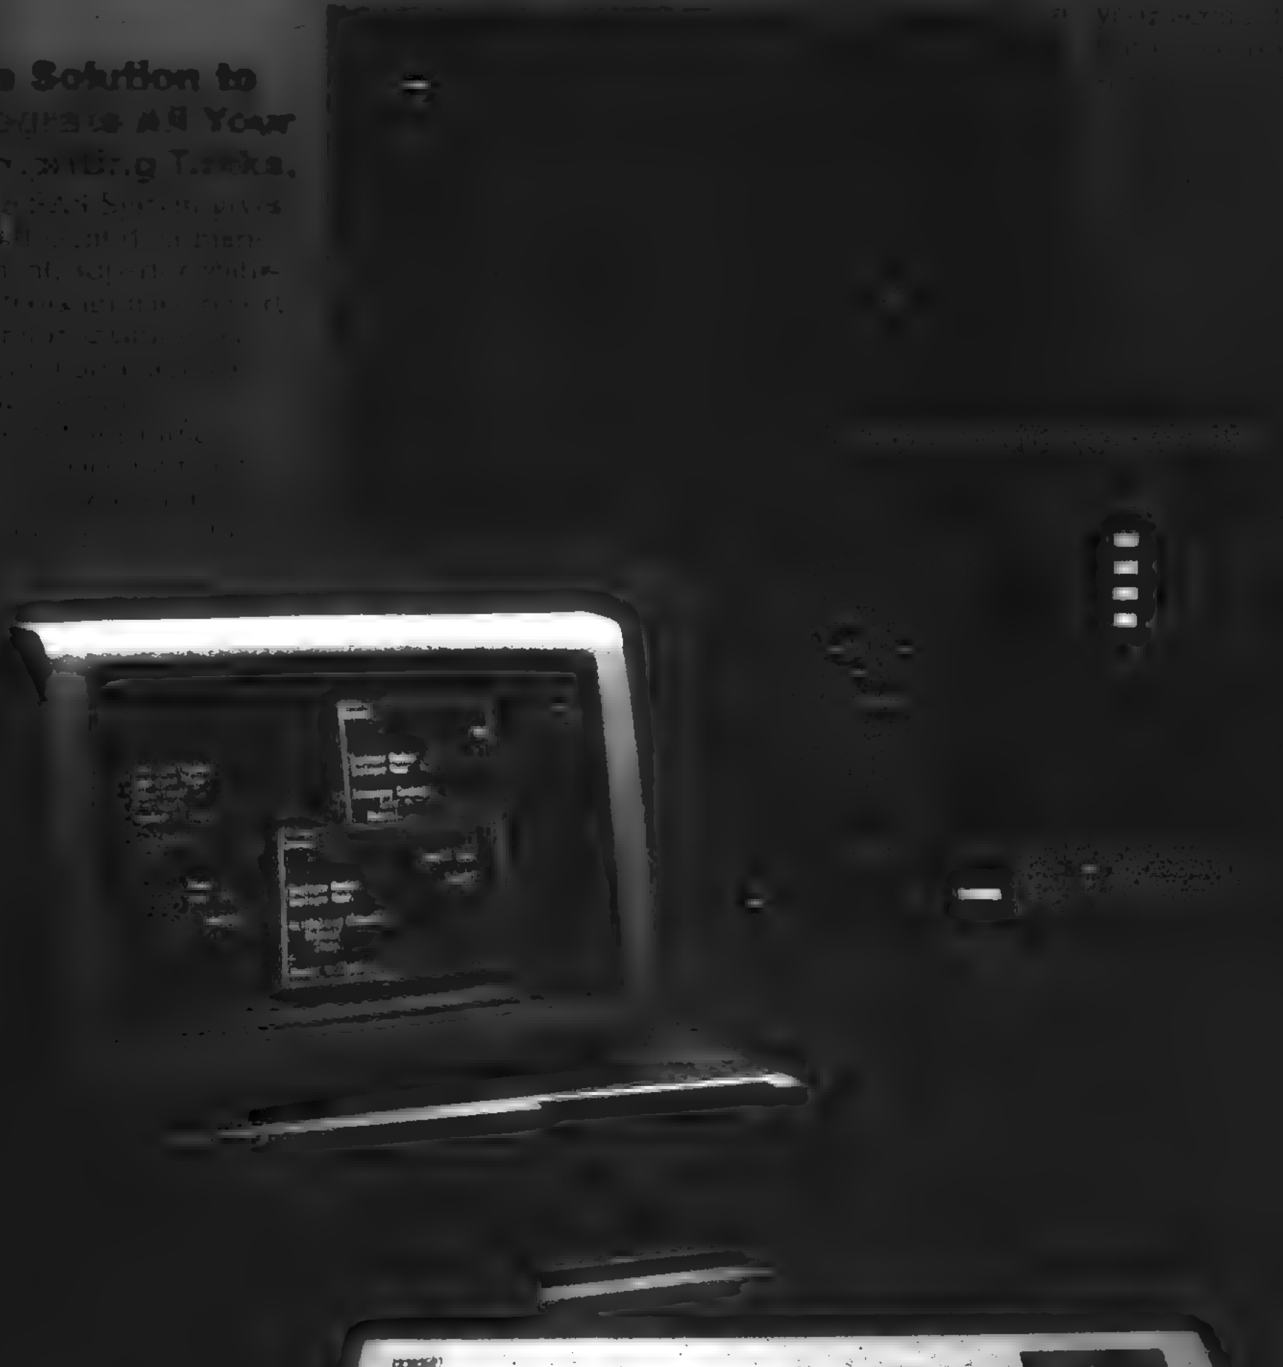
One Solution to Integrate All Your Computing Tasks.

The SAS System gives you [illegible]

fill-in-the-blank screens. On-line help facilities make it easy to handle every application, quickly and accurately.

You can track sales leads, manage prospect files, [illegible] the market [illegible]

share, and present results with the SAS System. Plus you can file employee and applicant records, analyze benefit programs, and manage the payroll. The SAS System can handle all your [illegible]



SYSTEM

Announcing Version 5.

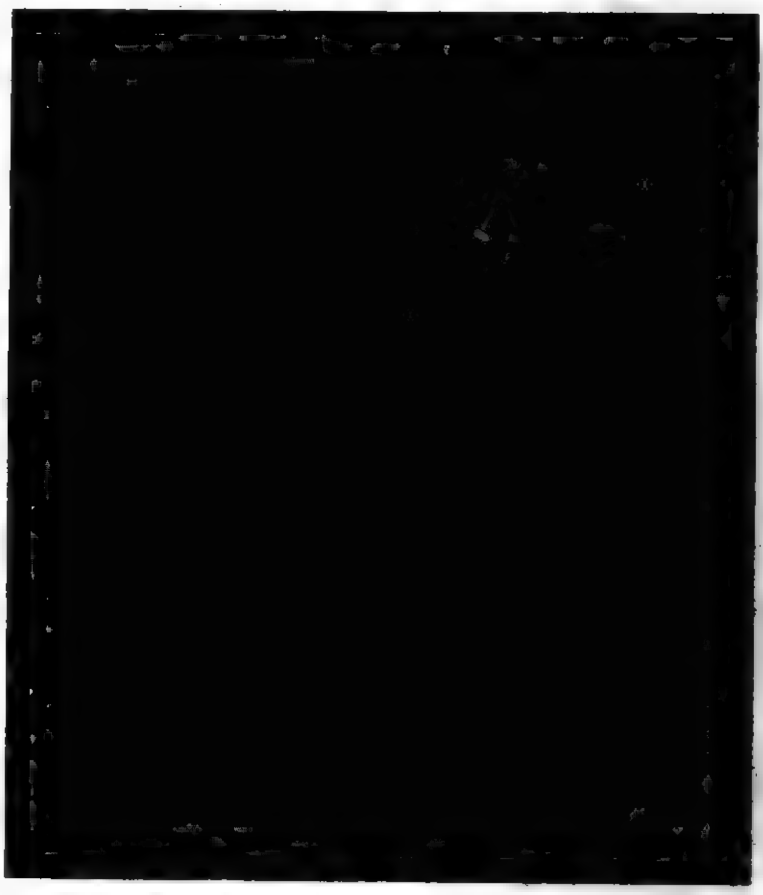
To Be Successful In Information Management, You Need More Than Just The Right Connections.



Connectivity. The buzzword of the year. Everybody's talking compatibility, multi-user interfaces, and integrated applications.

Well, excuse us, but it's about time. Datapoint has been delivering integrated information processing and office automation systems for more than 15 years. You see, we discovered a long time ago that people really gain productivity when computing power is distributed. Because the real power of business computers is access to information—wherever it is, whenever you need it.

It's more than a matter of stringing cable. The goal is deceptively simple. You and your people need desktop access to the information and the software and hardware tools you use to do your job. Even more important than choosing the right connections is how you use those connections. Managing information flow. Controlling data access. Allocating shared resources. Integrating applications. These are the tasks that will determine the success of your information management system.

And here's where Datapoint comes in. Take our Resource Management System.® The heart of the Datapoint® ARC® local area network. In fact, the Resource Management System is the first operating system designed specifically to take advantage of the power of local area networking. And it's at least a generation ahead of all the others.

Powerful Resource Management. Powerful enough to integrate the most complicated data processing applications with the most commonly used office automation tools. Of course, all this sophistication is totally transparent to your users. From any desktop workstation, they simply select the tools they need to make them more productive. Even if that workstation happens to be an IBM®-PC.

Flexible Resource Management. You can add, shift or remove workstations, peripherals, and software applications without bringing the rest of the system down. Without reprogramming. And, most importantly, without affecting your users' productivity.

The right connections—and more. From our pioneering efforts in distributed data processing to the world's leading local area network, the secret to the Datapoint success story is this unique combination of technological innovation with a singular focus on business productivity. If you're looking for the right connections in information processing—and more—call us toll free at 1-800-334-1122.

Hardware Roundup

By Ed Warner CW Staff

A look at 91 systems from 14 vendors

As technology blurs the old definitions, a major change from previous years is evident in this year's *Computerworld* Hardware Roundup of small systems.

Along with personal computers, 16-bit minicomputers have been included this year, both because the majority of minicomputers have incorporated 32-bit processors and because, at the other end of the spectrum, personal computers are exhibiting processing power and multiuser capability that once only minis could provide.

Other changes taking place in the computer industry are reflected in this week's roundup of 91 systems from 14 vendors. Most notably, fewer vendors of either type of machine are in the listing — yet the listing has grown larger. This reflects the shakeout occurring in the industry.

While many of the vendors who didn't make this year's list are still in business, their presence has diminished relative to the major players, according to market analysts. This is particularly true in the large-corporation market for personal computers. Many vendors are redirecting their pitch to small businesses or other market niches.

Overall, however, the number of models shown has grown about 20%, because the major personal computer vendors are keeping their older products alive while debuting new ones.

Vendors such as Zenith Data Systems Corp. apparently have taken a lesson from the Big Three automakers, offering a variety of models designed to fit every need, from high-speed processing to portability. Zenith's entries in the personal computer market now include a laptop portable, a "luggable" portable, an entry-level desktop computer and a high-performance model based on the Intel Corp. 80286 microprocessor — all introduced in the 12 months since the last Hardware Roundup was published.

> ”
>
> ***While diversity has come to mark the personal computer market, one touchstone has remained — IBM compatibility. The IBM-compatible Microsoft Corp. MS-DOS operating system is the one most often supported by non-IBM hardware.***

This emphasis on product diversity reflects the maturity coming to the personal computer market. As in the early days of the U.S. auto industry, a consolidation of manufacturers has taken place, but products remain diverse. Now, though, those products come from under one roof, which bodes well for the user who wants the support of a vendor that will still be in business in years to come.

While diversity has come to mark the personal computer market, one touchstone has remained — IBM compatibility. A quick overview of this year's roundup reveals the predominance of the IBM-compatible Microsoft Corp. MS-DOS operating system as the operating system most often supported by the non-IBM hardware.

An equally impressive bow to the IBM world comes from the 16-bit minicomputer side of the roundup, where about a half-dozen more machines have included Systems Network Architecture support among their communications protocols.

A problem, however, has come to dog the 16-bit mini — newer, more sophisticated software will only run on 32-bit machines. The 16-bit processors simply can't handle the volume of code quickly enough. For that reason, market analysts now predict the coming sunset of the 16-bit mini, caught, like the 8-bit personal computer, between the increasing inexpensiveness of more powerful hardware and the growing sophistication of software.

Another change from last year that has affected both minicomputer and personal computer purchasers is just how much more computer a dollar buys. In one example, an IBM Personal Computer model selling for more than $4,000 when it was introduced four years ago now can be acquired for about $2,200.

When last year's Hardware Roundup was published, the only entry from a major vendor running the Intel 80286 was the IBM Personal Computer AT, a machine then only a month old. Now nearly every major non-IBM personal computer vendor has an 80286-based machine, with Compaq Computer Corp. offering not one but two portable versions.

Another sign of greater sophistication in the personal computer arena is not evident from the charts, though. That is the increasing number of personal computers that incorporate a hard-disk storage unit.

And, where a Winchester disk of 10M bytes — as in the IBM Personal Computer XT — was once a thing to marvel at, most of the new hard disks provide 20M bytes or more.

Though the distinction between the personal computer and the 16-bit mini has become blurred, the mini still supports multiple users at a relatively low cost and will be with us for some time to come.

The Hardware Roundup is intended only to be a sampling of offerings on the market. The listings are not intended to be either a buyer's guide or an endorsement of any product.

“Everybody I talk to offers
that fit their products,

solutions
instead of my needs."

"Better talk to

AT&T.”

AT&T knows the
What you've already
as what you will buy.

Today, buying any computer product means thinking about where you've been—and where you're going.

AT&T understands this. Our computers are designed to protect your investment—with integrated products and solutions that help your system work as a system.

With AT&T Computers you can feel confident that your investment is and will remain a safe, sound business decision. It will pay off handsomely in increased productivity today and easy, efficient expansion tomorrow.

Three important questions:

Before making any investment in computers, invest a few minutes asking some tough questions. The answers from AT&T may surprise you.

1. Will the computer products I'm about to buy work with my existing system?

AT&T computer products conform to accepted industry standards. From minicomputers to modems, they're designed to fit in beautifully with your current IBM or compatible system.

In fact, AT&T Computers can talk to IBM* mainframes for easy access to host data using SNA/3270 or BSC/3270 protocols. Also available at a competitive price is the AT&T E4540 family of 3270-compatible controllers, keyboards and displays.

Our recently enhanced 3B Computers offer the performance advantage of UNIX™ System V in a departmental system, yet can be networked with existing MS-DOS*-based PCs.

Built on the principle of non-obsolescence, the DATAPHONE® II System is a full line of high-performance modems, multiplexers, data service units, and diagnostic control devices. These combine data transmission and sophisticated network management capabilities, thereby maximizing uptime of either simple or complex networks.

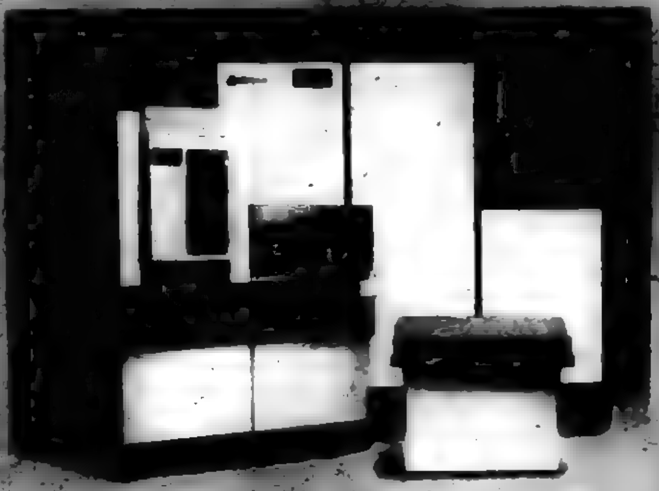
2. Will these products deliver the capabilities I need today? Am I getting my money's worth in terms of price and performance?

AT&T can answer "yes" to both questions.

reality of your computer needs. bought is just as important

Our line of high-performance computer products can be linked together to cost effectively deliver end-to-end communication and information management—from desktop to department, and from department to mainframe.

Our MS-DOS-based AT&T PC 6300 is twice as fast as the IBM PC, and has built-in color graphics capabilities and an easy-to-expand design.



THE COMPUTERS WITH THE FUTURE BUILT IN

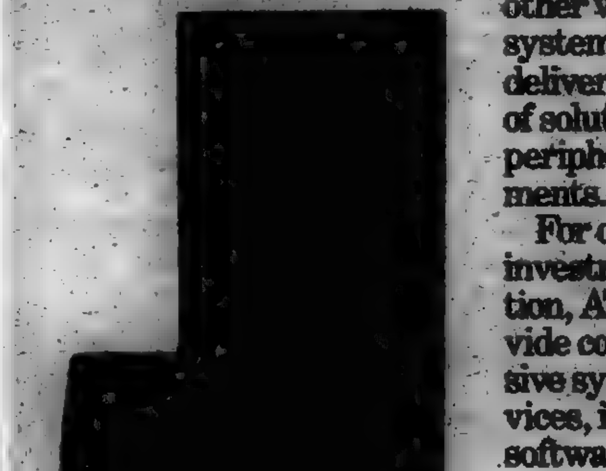
AT&T 3B2, AT&T 3B5 and AT&T 3B20 Computers

Taking advantage of the UNIX System's multi-tasking, multi-user features, the AT&T UNIX PC offers a unique combination of power, ease of use and communications capabilities.

Our UNIX System V-based 3B Computers—five new or enhanced supermicro and minicomputers—provide distributed and departmental computing at a competitive cost per user.

We also offer full-featured, reliable peripherals—synchronous and asynchronous terminals, printers and plotters. Compatible with AT&T Computers and other vendors' systems, they deliver a full range of solutions to your peripheral requirements.

For ongoing investment protection, AT&T can provide comprehensive system services, including software development, system design, implementation, and training. A 24-hour technical hotline is available for hardware and software support.



AT&T DATAPHONE II System

3. What about tomorrow? Will these products keep my growth path open to accommodate future needs, especially in terms of networking capabilities?

No need to worry about the future when you start with The Computers With The Future Built In from AT&T.

As technology advances, AT&T will enhance and support its products, increase performance, and maintain compatibility with industry standards.

Our commitment to an open architecture and support of industry standards—MS-DOS, UNIX System V and SNA/3270 and BSC/3270 protocols—gives you the flexibility to satisfy your applications needs.

The power of the AT&T 3B Computer family can be networked in a variety of ways. Because they run UNIX System V, the 3B Computers offer an opportunity to build an open system with hardware independence and software portability.

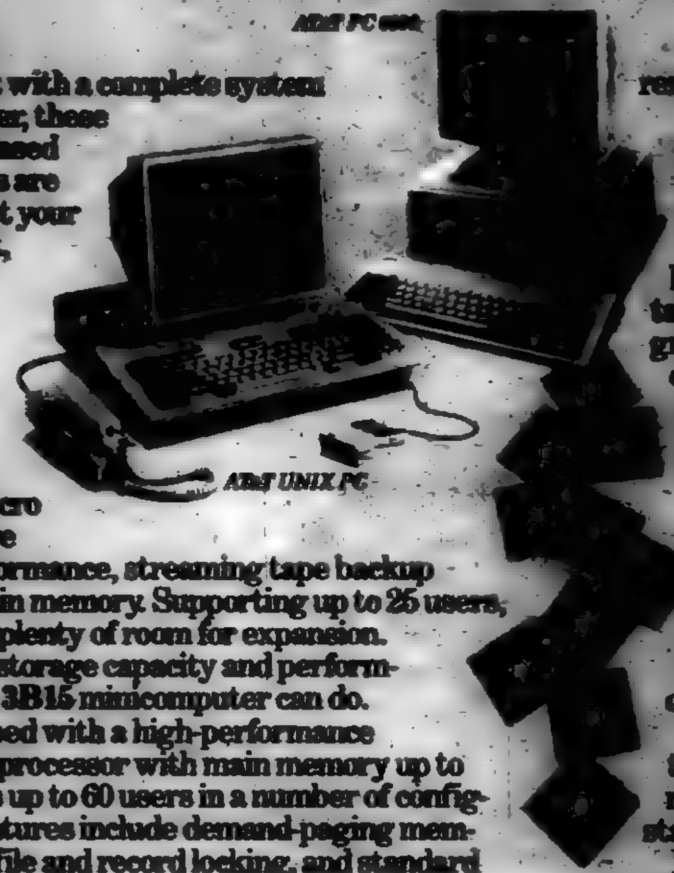
What's more, our UNIX System V software base is growing by volumes.

AT&T's Information Systems Network links your equipment in a single corporate-wide network. The AT&T STARLAN NETWORK is our low-cost local-area network that uses existing phone wiring to tie your PCs together.

However your needs change, one thing won't change: Your investment is protected with AT&T Computers.

For a more detailed look at what AT&T computer products can do for you, just turn the page.

See what makes AT&T computer products a sound investment.



AT&T PC 6300

AT&T UNIX PC

Whether you start with a complete system or a single computer, these communications-based computer products are designed to protect your investments—past, present and future.

Our new AT&T 3B2/400 Computer takes full advantage of UNIX System V. This true 32-bit micro offers full hardware floating point performance, streaming tape backup and up to 4 MB main memory. Supporting up to 25 users, the 3B2/400 offers plenty of room for expansion.

For even higher storage capacity and performance, see what our 3B15 minicomputer can do. The 3B15 is equipped with a high-performance WE™ 32100 microprocessor with main memory up to 16 MB. It supports up to 60 users in a number of configurations. Other features include demand-paging memory management, file and record locking, and standard floating point performance.

For those looking for the next step forward in personal computers, the AT&T UNIX PC offers a unique combination of computer capabilities. You'll have the power of UNIX System V to support multiple tasks and multi-users. The 512 RAM is expandable to 2 MB. There's also a 20 MB hard disk. This outstanding business tool also features a built-in modem and communications features to easily access remote processors and departmental file servers.

AT&T 3B15 Computer
AT&T 4418 and 4425 Terminals

The DATAPHONE II System is a family of digital and analog modems, multiplexers, data service units, and diagnostic control devices for multilevel network management and control. We have added the DATAPHONE II 2500 and 2600 Series Digital Data Service Units to the family. An integrated DSU and channel service unit in one compact, easy-to-operate unit. It features a graphic LCD display for instant recognition of test results and is compatible with DATAPHONE II equipment.

The AT&T 4540 family offers true 3270 compatibility, and a choice of keyboards, controllers and screen colors. With Asynchronous Host Adapter option, you'll be able to switch back and forth easily between synchronous and asynchronous applications.

Our connectivity products conform to industry standards to insure that AT&T 3B departmental computers as well as desktop workstations can access your mainframe applications. For example, SNA/3270 Emulator + software provides fully configured SNA IBM 3274 controller emulation; BSC/3270 Emulator + software emulates the BSC IBM 3274 cluster controller.

AT&T 4540 Terminal
AT&T Dot Matrix Printer

AT&T Application Program Interface access routines allow C language programmers to communicate directly to host computers in 3270 mode.

There's much more to tell you about AT&T computer products, and how they can help solve your business problems.

So before you invest your computer dollars, invest a few minutes of your time with an AT&T Information Systems Account Executive, an authorized AT&T supplier, or call 1 800 247-1212.

Consultants: Getting your money's worth

Update

Choosing and using consultants

By Glenn Rifkin
Update Editor

Good counselors lack no clients.
— William Shakespeare

Frank Allen has to think a minute to come up with a success story. It isn't that the vice-president of information systems practice for Arthur D. Little, Inc. (ADL) lacks a bountiful supply of happy endings. But illustrating perfectly the full benefits of an outside consultant — that takes some thought. Allen then describes a client, a large chemical company, that had come to recognize that the computer support in its major research laboratory was second rate. An engineer within the company was asked to investigate the problem and quickly realized he needed outside help. He set up a formal committee to tackle the problem and brought in Allen as well as a representative from IBM.

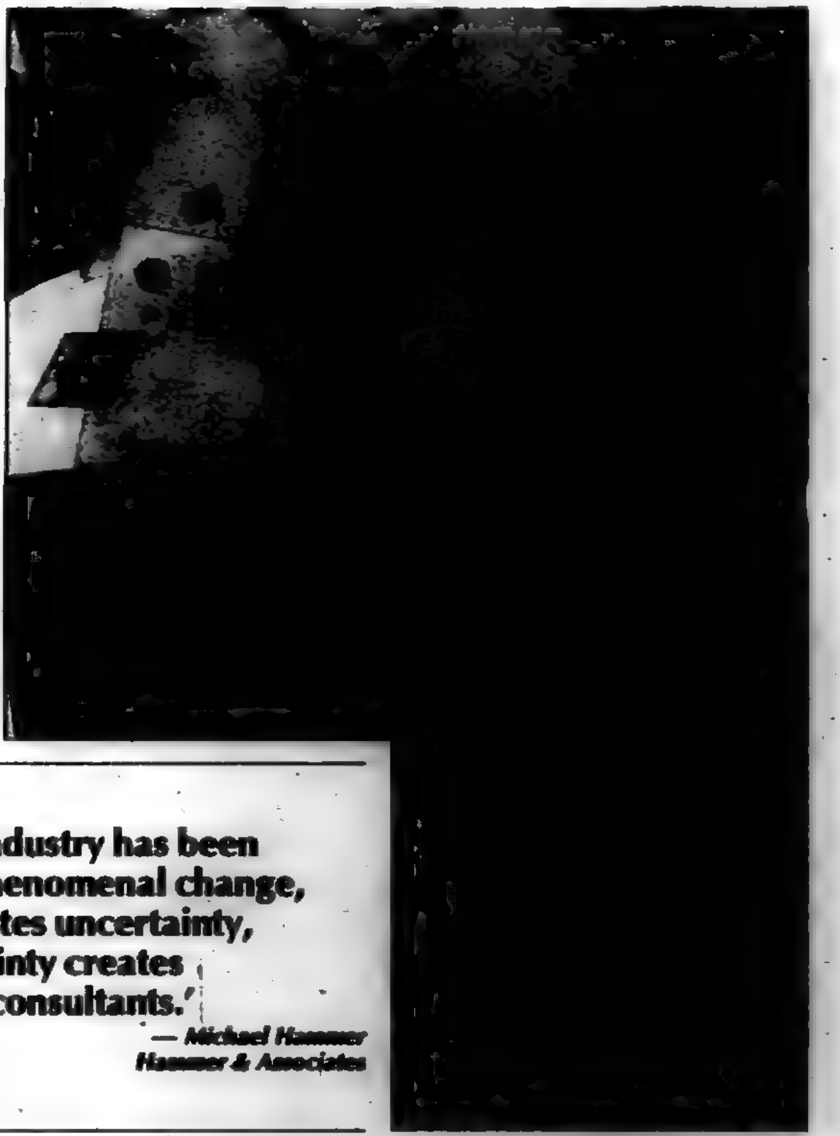
"We worked as a team," Allen says, "and spent six intensive weeks of 10-hour days attacking the problem. We realized that the lab, which was a Digital Equipment Corp. shop, needed to be a two-vendor shop, at least for a while."

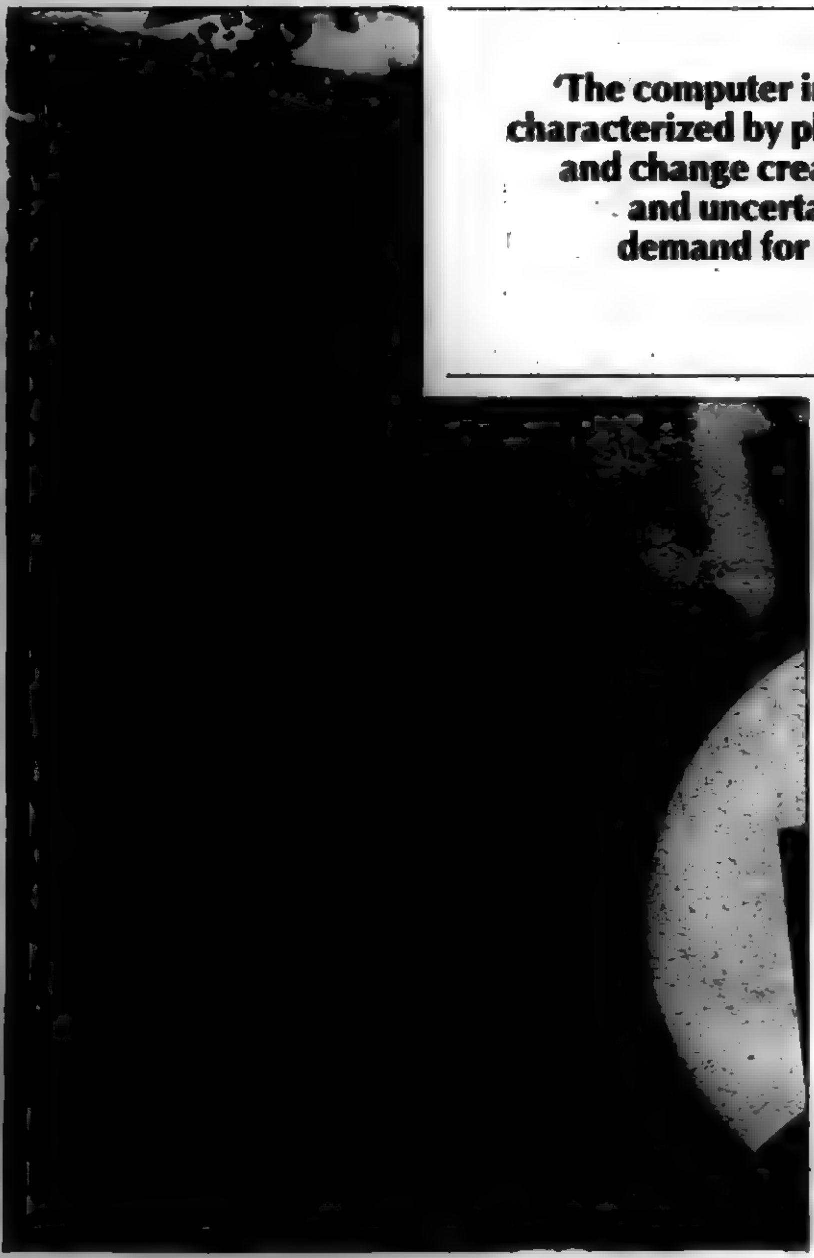
Based on the team's recommendations, a new IBM mainframe was installed, and, according to Allen, the lab's computer support is now top rate. "It was a very satisfying assignment," Allen notes, "except that my lawn died."

For the Bobst Corp., a printing machine manufacturer in Roseland, N.J., about to convert to a new manufacturing resource planning (MRP) system, the decision to use an outside consultant came from above the data processing shop. Top management directed that a consultant be brought in to ensure a smooth switch over.

According to Gary Gittleson, Bobst's MIS director, "Top management wanted a safety net. MRP is a big system, and they felt DP couldn't handle it alone. MRP is a new concept, and there are no standards yet. You can't go to a book for an answer."

Despite the dictum, Gittleson insists there is no resentment from the DP staff. "There are the usual interface problems between DP and users, but MRP is clearly so different from what we do here that there is no resentment. The consultant earns his money."





'The computer industry has been characterized by phenomenal change, and change creates uncertainty, and uncertainty creates demand for consultants.'

— Michael Hammer
Hammer & Associates

In Tulsa, Okla., Gary Stice recalls the displeasure he felt at his data processing job when an outside consultant was brought in. "I didn't want a consultant coming in the door, sitting next to me asking a lot of questions and getting paid three times what I was making," Stice says. "It can certainly cause conflict."

Stice is now an independent software consultant.

Some people swear by them; some swear at them. But one thing is clear: Independent computer consultants and large consulting firms both have more work than they can handle, despite the computer industry sales slump. It is impossible, because of the shapes and flavors consultants come in, to number precisely the profession. But a few of the following figures may be illustrative:

- According to the *U.S. Census of Service Industries*, the demand for information systems consulting has more than quadrupled since 1978.
- The Independent Computer Consultants Association in St. Louis currently carries a listing of more than 1,600 member firms representing more than 4,000 independent computer consultants.
- Arthur Andersen & Co., the Chicago-based international accounting and audit firm, plans to hire nearly 2,000 recent college graduates for its management information consultant division before the end of the year, bringing its total manpower in this group to more than 7,000 worldwide. Arthur Andersen estimates that it was involved in 4,000 DP/MIS engagements last year alone.
- The second largest computer maker, DEC, spent more than $25 million on outside consulting in 1984.

Update

Abundantly clear is this: Find a DP/MIS-related question, and there will be a long line of outside consultants ready to answer it. Consulting, a burgeoning business across many industries, has found a warm bed in high technology, and the explosive growth both in consultants and in consulting dollars appears to have no end in sight.

According to Michael Hammer, president of Hammer & Associates, a Cambridge, Mass.-based consulting firm, consulting has become institutionalized in the MIS world. It is standard, he points out, to retain consultants in MIS while in many other functional business areas, consultants are rarities.

"The computer industry has been characterized by phenomenal change, and change creates uncertainty, and uncertainty creates demand for consultants," Hammer says.

Virtually every DP/MIS manager uses outside consultants at some point, whether reluctantly or enthusiastically. Consultants and clients alike agree that successful relationships require great care and feeding. This *Computerworld* Update explores the ways users can get the most out of the consultants they hire.

When to look outside

The term "consultant" has become overused to the point of abuse in recent years. Virtually anyone can — and it seems does — print up business cards and letterhead and consult. Contract programmers, once considered simply hired hands, are now calling themselves consultants. Everyone from strategic planners to management specialists has hooked on the tag (see story Update/15).

This confusion has created a minefield for DP/MIS managers, not to mention a plethora of potential legal hassles for consultants. California, for example, is trying to ban independents, arguing that they are simply employees seeking to avoid certain tax obligations by calling themselves consultants. Congressional hearings are under way to determine whether Big Eight accounting firms should be allowed to handle DP consulting for firms they audit.

Before deciding how to choose a consultant, the DP manager must decide when it is appropriate to look outside. It is often a more complex decision then it appears, especially for large corporations with vast, in-house DP/MIS resources.

A consultant can provide as many headaches as solutions. Internal politics and morale are a constant worry for the DP manager. With their high hourly salaries, consultants can cause loud grumbling among DP staff members who think they could have handled the task themselves — and at considerably less cost.

Consultants are expensive. James Martin, the noted data processing author and lecturer, earns a reported $25,000 per day, while other well-known consultants command $5,000 to $10,000 per day plus expenses. The large firms often charge upwards of $200 per hour, while the technical specialists generally run in the $100 per hour range.

Most Fortune 1,000 corporations, says Harvey Poppel, a consultant with Broadview Associates in Fort Lee, N.J., "have reached a point where the things that were done in the past are changing. The DP manager is becoming an anachronism. If they don't adapt, they will become dinosaurs. This makes DP a fertile field for consultants."

For technical issues such as micro-to-mainframe links, local-area networks, managing microcomputers, office automation, telecommunications, information systems architectures, artificial intelligence and general systems integration, the know-how may not be available from an internal staff that is struggling to fill backlogged demands of the daily business.

"You can read about these things," says William Inmon, a consultant with Coopers & Lybrand in Denver, "but it's like golf and sex; until you do it, it's all theory. There's no replacement for experience."

Internal staff may also not have the time and experience to follow vendor trends in both hardware and software. The technology changes so quickly that outside expertise, devoted to just such a task, may become essential.

In addition, as information systems have begun to change the nature of many industries, the DP/MIS shop is making the transition from simply a service organization to a strategic part of the company's business. This difficult repositioning often dictates the need for outside advice, and DP management consultants are reaping the benefits of this change.

"The expertise required goes far beyond technical talent," Poppel declares. "You need a range of business knowledge, and it is rare for the DP staff to be exposed to that."

"We use consultants for two reasons," says William Harris, director of information services for Coca Cola, U.S.A. in Atlanta. "There are times when we are looking for an independent viewpoint and other times when we just don't have the experience in-house."

"The consultant isn't there to run your business but to supplement your internal skill," adds Ian Scott, vice-president of information systems for Dart & Kraft, Inc. in Northbrook, Ill. "They've seen the same situation over and over and been through the problem before. It's the first time for us, and they provide added value."

For many clients, the outside consultant serves as a mediator and a sparkplug who cuts through internal politics and territorial bickering to get projects moving.

"We brought in a consultant mainly to solve internal arguments, bring about a group consensus and get things moving forward," says Clay Snyder, assistant department head of technical information at General Motors Corp.'s Research Laboratories in Warren, Mich.

"We had Nolan Norton in here to do a study on how the MIS resource should assist in making the company run," adds Herman Cordes, MIS manager for Raymond Kaiser Engineers, Inc. in San Francisco. "Some of their recommendations were enacted, and others were shelved. But the biggest thing they did was act as a catalyst for bringing people together. People from all departments had to make time to discuss their problems, and it really made a difference."

For the leading management consulting firms, such as Nolan Norton, Booz Allen & Hamilton, Inc. and ADL, the questions are beginning to emanate more from corporate management than the DP shop.

Poppel

According to Robert Howe, vice-president in Booz Allen's Chicago office, clients generally come to them with several business questions:

- Is the company getting the proper information technology support to remain competitive with the business across the street? Howe points out that this question is particularly crucial in the banking and financial industries, in which the recent deregulation of banking has dictated the need for the highest level of information technologies.
- The cost/value relationship. Companies are spending millions on information technology, and the costs keep going up. Is the company spending enough or too much, and is it getting value for what it is spending? How can the chief executive officer measure the value of what he is receiving?
- The transition in information technology. Most large companies have basic mainframe operating systems in place, but how can DP structure itself to pursue the next opportunities that tend to be more in the end-user and decision support realms than in traditional applications?
- How does the DP/MIS manager execute all of these changes? Howe describes this as a "return to basics." The DP manager understands he needs these systems and is ready to have them, but how can they be delivered?

"DP is really catching a tremendous amount of pressure now," Howe says.

"Backlogs are through the roof, and everyone is demanding answers.

Managers are asking, 'How do I get the resources and set my priorities to execute the needed changes?' "

Where to find them

Finding the answers to these questions, and many others, is the job of the consultant. From the one-man operation to the larger Big Eight firms, there are literally thousands of consulting options from which the DP manager can choose. That choice is dictated by factors such as cost, reputation, experience, area of expertise and need (see story page Update/4).

Though many Fortune 500 DP shops have already established long-term relationships with one or more consulting firms, smaller data centers, seeking outside advice for the first time, are advised to do some shopping.

Dart & Kraft's Scott says, "A structured evaluation in choosing the consultant will avoid problems down the road." He advises measuring four or five consultants by the following criteria:

- Can they clearly demonstrate the capability to

Update

Consultants: Recognizing your need for one, picking a suitable candidate

By Robin F. Goldsmith
Special to CW‡

Consultants can be intimidating. They always seem to have been hired by your boss' boss' boss. They generally show up only when your project is in trouble. They second-guess you a lot.

After a consultant has spoken behind closed doors, you may find yourself being blamed for the problem itself and also for being a lousy manager. Worst of all, the company listens to a consultant when it wouldn't pay any attention to you saying the same things.

What can you do about consultants? One approach is to get your own consultant before one gets you.

Like many systems managers, you may think you can do everything yourself. Obviously you cannot. You may not always recognize when you need assistance, or you may be afraid to admit you need help. In either case, you can be faulted for not getting the assistance.

Hiring your own consultant at least shows that you are using business judgment and doing what you can to make the project succeed. Besides, the right consultant should help provide the assistance you need to avoid the types of problems that usually attract someone else's consultant.

Even if troubles still occur, you probably will fare better. You are more likely to be considered a responsible manager who has recognized and acted upon a need for assistance. Moreover, if you have done all you can, your bosses may realize problems were caused by factors beyond your control.

Furthermore, the higher-ups are accustomed to getting assistance from consultants. By hiring your own consultant, you are beginning to exhibit management skills with which they can identify.

Here are some guidelines on how to find the right consultant to help you meet your objectives.

First, define the consultant's role. Knowing the role helps you find a suitable consultant. Moreover, it is essential for telling the consultant what needs to be done and determining whether the consultant has performed adequately.

The consultant's role should involve assisting in those areas that cause your problems. Accurately identifying these areas can be exceedingly difficult because we frequently are unaware of our real weaknesses.

Instead of addressing areas that others think are important, we tend to concentrate on our own strengths and interests. For example, systems managers have a reputation for thinking too much in terms of technology. This tendency is widely recognized as a major source of our frustration with and inability to satisfy users.

Thus, if asked to anticipate areas in need of assistance, the typical systems manager probably would stress technology — more computer power, tools and data bases, more test time, more programmers and maybe a few more technical heavyweights. You may be able to benefit from consulting assistance in technical areas, but do not overlook other areas that may still cause trouble.

How can you anticipate other true needs when they only become apparent in hindsight? The key is to put yourself in the place of people who will judge you. Try to appreciate the perspectives of your boss' boss, your user's boss and their bosses. They will judge you with respect to their areas of strength and interest.

These are the areas where you may be out of your element, where the right consultant can really help. Typical areas that seem to cause problems for systems managers may involve business strategy, systems planning, project management, financial accountability, competitive factors and the application itself.

In defining the consultant's role, you must identify not only the content area but also the specific work product you need. The consultant's product could be a review of the present system, an analysis of the feasibility of implementing various alternative systems, design of a new system, recommendations for selecting hardware and software, training staff, recruiting personnel, developing a system, installing a system or even managing a data center facility.

"I think I'm going to need a consultant to make this decision."

Once you have defined the role the consultant is to play, you need to start looking for suitable candidates. Even though consultants seem to be everywhere, it may not be easy to find one who fits your role requirements.

Goldsmith

The most direct approach is to advertise in newspapers and trade publications. Governmental bodies generally are required to advertise publicly for goods and services, including consulting. Advertising has its drawbacks — you may get more responses than you can handle, and you may not want to publicize what you are doing.

Some capable consultants avoid open bids because the costs of proposing tend to be high in comparison to the chances of being selected.

Most people rely on word of mouth to find a consultant. Be prepared to do some legwork to find candidates. Contact business people who are likely to know of consultants to fill your role: hardware and software vendors, other companies in your line of business, bankers, accountants, other consultants, professors and professional organizations.

You are going to rely upon your consultant, so choose carefully. Meet them and check on them. You must have confidence that your consultant can fill the role you have defined. Your consultant must have credibility, which comes from a combination of independence, expertise and style.

Independence means that the consultant has no stake in having any particular outcome, including the one you advocate. A vendor cannot give independent advice about a product the vendor is trying to sell you. The distinction can become blurred when some other sale may hinge upon the outcome. Can a consultant design a system and then review it impartially? Occasionally, consultants are accused of recommending a particular course of action because it will give them follow-on business.

Such abuses may occur. The best protection is close monitoring of the consulting engagement. Each assignment should stand on its own, without undue expectations for follow-on work. On the other hand, it is pointless to have a policy of refusing to give follow-on work to a consultant who has performed satisfactorily.

Remember, a truly independent consultant gives advice which not everyone likes from time to time. Do not put too much emphasis on bad references from clients who did not like the consultant's advice.

Most people think consultants should have all the answers. That is unrealistic. Besides, why bother hiring a consultant whose recommendation you already know? A consultant whose mind is already made up is no more independent than a vendor. It is far more important that the consultant knows what questions to ask.

If you are engaging a consulting firm, rather than an individual, remain conscious of the fact that consulting assignments are performed by individual workers, not by firms and not by salesmen. Be aware, too, that some firms think they can fill any consulting role just because of who they are. They cannot. Good planners often are poor implementers. Good reviewers often are poor designers.

A firm's experience with consulting projects performed by other employees of a consulting group has little relevance for you. What counts are the skills and experience of the individuals who actually will do the consulting work. Make sure you know who they will be.

Because consulting is very personalized, your consultant's style is important. You have to feel comfortable with the consultant, as does anyone who you expect the consultant to influence.

Ironically, this sometimes may mean you are hiring a firm rather than its individuals. For example, the fact that a report is from a big-name consultant may be even more important than its contents.

You pay for a big name. Often the price is not worth it. In some cases, only the big-name firms can provide the specific expertise you need. Surprisingly, though, even a big-name firm may consist mainly of experienced sales people and relatively inexperienced consulting staff members.

You may get better service and lower prices from these people after they have left the big-name organizations.

Once you have decided to select a consultant, make sure up front that both of you know exactly what is expected of each other. Don't nickel and dime over price; you will end up paying more or getting less.

Put your agreement in writing, incorporating the proposal and being sure to define deliverables, client participation, schedules, project reporting and payment as specifically as possible.

Then manage that project to make sure it happens. ■

Goldsmith is president of Go Pro Management, Inc. and senior associate with Chasby Associates, Inc. in Needham, Mass.

Update

CONSULT

from UPDATE/3

handle the problem quickly?

- What do their references have to say?
- Have you met the specific team members who will handle your assignment?
- Do they have the technical and interpersonal skills required to work with your group?

Before choosing a consultant, the client must have an idea of the options. Here are a few:

Big Eight accounting and audit firms. From specializing in handling corporate finances, firms such as Arthur Andersen, Coopers & Lybrand and Peat, Marwick, Mitchell & Co. found a natural segue into the data processing and information systems consulting business. Today, this market has become substantial for accounting firms, making up about 30% of billings in Arthur Andersen's case.

What these large, international firms offer is an abundance of resources. They boast that when hired, they are not just providing a single consultant but access to the massive experience and research capabilities of the entire firm. Although the lead consultant will interface with the client, he might be supervising a team of several consultants involved with the project. In addition, should a client require further expertise, the firm can call on specialists from any of the branch offices and fly them in for the project.

While independent consultants tend to specialize in certain technical areas, the bigger firms have expertise in a range of disciplines. Big Eight consultants point out that, although a client may only see one or two faces during an engagement, those consultants are spending hours discussing the problem with other experts back at the home office.

These large, established companies also provide stability. Edward Bruckstein, senior consultant with Peat Marwick in New York, points out that, unlike the case with an independent consultant, "a client knows we will be around tomorrow. The client is paying a premium for us, no doubt about it. But they are getting improved quality. Sure, we've messed up some jobs, but we stood by the client. It might have cost us twice as much to correct our mistakes, but we did it."

The accounting firms tend to be more than advisors. "We're in the design *and* installation business," notes Simon Moughamian Jr., managing partner of Arthur Andersen in Chicago. "We've always prided ourselves on the fact that we didn't just tell a client what to do; we helped them do it."

Management consulting firms with specialization in information systems. Management consulting in information systems is hot. According to the Association of Management Consulting Firms, Inc. (Acme), 62% of its member firms now offer information systems consulting, an area Acme considers among the hottest of all management consulting disciplines.

Though the Big Eight firms also take on management consulting, they generally find themselves working in concert with, rather than competing against, the management consulting companies. For Booz Allen, ADL, McKinsey & Co. and others of that type, the mandate is to match the understanding of technology with the insight into managing varied and specialized businesses.

At Booz Allen, for example, Howe points out that there is a large staff devoted to drawing up business strategies for banks, insurance companies and other financial service organizations. The technology consultants can and do draw heavily on that business expertise in their own work. The average full-time staff member at Booz Allen, he says, has three to five years of significant systems experience and most likely a master's degree from Harvard, Stanford or a comparable school.

"The client is paying for the combination of business and technology expertise," Howe says. "The challenge is to stay up on both those issues in order to help the client to a competitive advantage." According to Frank Allen, ADL "can put together a team that can understand complicated interdisciplinary problems."

The top management consulting firms also pride themselves on being at the very cutting edge of their business.

"Our people tend to have lived the problem themselves," Howe declares. "We're expensive, and we think we're good. We don't get called in to solve yesterday's set of issues."

Independent consultants. True to their name, this growing group of consultants cites the independence of working alone as the No. 1 motivator to going this route. According to

Inside, outside: Where do consultants fit in?

Two of the nation's largest banks, Chase Manhattan Bank NA in New York and Security Pacific National Bank in Los Angeles, have vast computing needs and extensive DP/MIS staffs to service those needs. Over the years, both banks have made extensive use of outside consultants for everything from contract programming to strategic planning. The use of external consultants has resulted in outstanding successes

Interview

What are the key reasons for bringing in outside consultants rather than sticking with your own in-house expertise?
Singleton: There are two reasons. [One is that] you already know what you want to do, but you need that objective third party to confirm it for top management and take you off the hook.

The second reason is that you really don't know what to do. You don't have the technical expertise or the experience inside to make that decision, and you truly need the outside expert to come in, look at various alternatives and make some recommendations.

What are your recommendations for ways to make the consultant relationship a positive rather than a negative one?
Singleton: You have to manage consultants just like you would a project for your own organization. The reason consultants don't work out is often that the objective or mission is not clearly defined.

What happens is they start out with what they think is their premise for being there. You think you've given them a charter, and you don't meet weekly to confirm how well they're doing on that charter. As a result, they start to generate paper, they stir up your staff, they stir up the users, and the whole thing becomes almost counterproductive.

We spend almost as much time launching the consulting study as we do managing it because we find if we don't, it gets off to the wrong start.

Have you seen examples where people feel consultants are treading on their territory?
Singleton: Yes, no question about it. You have to sell the use of consultants. For example, you can say, 'If you don't need a consultant, what I suggest is you do that study in 90 days, which is what the consultant would have done, and, by the way, he says he can save between $2 million and $3 million, so I would expect you can save the same.'

Now, he's got a choice. Did he put his foot in his mouth by saying 'I don't need a consultant' because he now has got to deliver what the consultant would have? And if he does, you're a winner all around. If he doesn't, he may come back and say, 'I'm finding this a little harder than I thought. Let's talk about this. Let me control him, but let's bring him in.' Either way you're not forcing it.

What about ways to pay for consultants?
Singleton: I do not go for time and materials. That's like giving someone a checkbook, signing all the checks, and he puts the amounts in. I like to operate on fixed price. If it's fixed price, we are both focused in much more sharply on what I want and what he is going to give to me. If it's time and materials, the $100,000 study becomes a $300,000 study, and his comment is, 'I need another [$50,000] to finish it.' You're at his mercy.

John Singleton

> 'If you hire a consultant to write your strategic plan, you are making a mistake.'

How do you cost-justify a consultant?
Singleton: We looked in one particular case at what a planning staff cost us, and a consultant would be about 30% of what the planning staff cost. Plus, the consultant is going to deliver the product that the planning staff never delivered.

The other thing we tried to do is work out a joint venture with consultants. What I've said to them is, 'You identify the savings and you charge me time and materials for the actual cost of your people but no profit on it. What we will do is work out a sharing basis on the cost savings, and we will give you X%. If you hit the $3 million or $4 million goal, for example, it will generate [revenue] to you far in excess of what your profits would have been.'

Have consultants accepted this pay structure?
Singleton: Yes, we've had two or three of our last major consulting firms [take on] that. One identified about $10 million in savings in one area and will be sharing in that and will be making over $1 million in additional fees. But we'll be saving $10 million. Another identified about $5 million in operating costs and will get a percentage of that.

We negotiated on the percentage they'd get of the cost savings. The cost savings had to be validated by the financial controller of our corporation. So they were hard dollar savings and not soft dollars.

What are some of the key technical areas for which you recommend using consultants?
Singleton: Let me tell you an area I wouldn't recommend. Consultants are always coming by and saying 'let us do your strategic planning for you.' In our use of consultants, they didn't do the plan, we did the plan. All the line managers wrote the plan. The consultants acted as facilitators and consensus developers at the meetings, taking us all through the same logical steps — mission statement, strategy, goals, projects and critical constraints that might stop us from getting there.

We did all the work. Many consultants will come in and say, 'We will write the plan for you.' They are not qualified to write your plan, and if you hire a consultant to write your strategic plan, you are making a terrible mistake. It's a waste of money and time.

Where would you use them?
Singleton: An area where they are effective is in telecommunications. The deregulation of AT&T has created a nightmare for most DP people. With all the changes, it is appropriate to find a person who is truly an expert in that area and can come in and show you how to take advantage of the integration of voice and data.

In the area of artificial intelligence, where there are not a lot of systems in existence and you've got somebody who has done it — not someone who talks about doing it but who has actually done it — I'd bring them in.

How do you check the credentials of a potential consultant?
Singleton: In the case of the telecom consultant, we went to the telecom companies that this particular consultant had worked with and asked how effective he was. They complained about him, how he had nitpicked and drove them nuts. And that made us feel pretty good because they meant he was hard-nosed in writing [specifications] and making telecommunications companies address those issues. The more complaints I got, the better I felt about him.

What is the best reporting mechanism?
Singleton: They should report to the line manager who is going to have to implement the recommendations. I'd manage a consultant on a daily basis if it [was] a short-term assignment, certainly no less than weekly. Reports should be made in person by the way; I don't like mailed reports. I like them to bring it in and walk through it. And I like them to have all the members of their team there so you can ask questions. I always ask if there is a minority opinion on this. If not, I ask why it isn't there. I'm a little concerned if they all think the same way.

I force the minority opinion out and then ask them to defend why they didn't select the minority opinion. That is seldom done.

How much autonomy should a consultant have?
Singleton: You can have access to my whole organization, but I want to know where and why you are going in those areas. Don't forget, the meter is running. ■

Update

as well as dismal failures. Both banks continue to depend on contributions from outsiders.

As the cumulative experiences with outside consultants have added up, both Security Pacific and Chase Manhattan have developed internal strategies for engaging and managing consultants.

The banks have taken divergent paths, however.

Security Pacific has one of the most successful DP operations in the U.S. and has done so well in servicing its users that the bank recently unveiled the Security Pacific Automation Co., a division servicing other DP users. John P. Singleton is president of the new division.

At Security Pacific, there continues to be unabated enthusiasm for using outside consultants, although with strong management and direction.

Chase Manhattan, on the other hand, has taken steps to cut down on its use of external consultants by creating an internal consulting group to handle many of the chores formerly delegated to outsiders.

Stan Schrager, vice-president and division executive of Systems Management Support, directs the internal group of 38 consultants.

According to Schrager, the group provides resources and support throughout the bank for computing needs and actually competes with outside consulting firms for work. The group has no set budget; expenses are covered by charging back costs.

Computerworld Update Editor Glenn Rifkin interviewed both Schrager and Singleton to get their respective views on when to look for outside consultants and when to stay inside.

Stan Schrager

'It is instinct for [consultants] to turn around and use their experience with your competition.'

[illegible]

Update

CONSULT from UPDATE/5

Gary Stice, independent consultants generally come from one of two sources — large consulting firms and data processing or MIS shops.

After 20 years in DP, Robert Gershon, an independent consultant in Deerfield, Ill., decided to go it alone. "This is the only way to be," he says. "I'm far happier than I ever was before." Thomas O'Flaherty, principal of Information Service Strategies, Inc. of Woodridge, N.J., agrees. "I didn't want to be an MIS director all my life," he says. "I was typecast as a techie, and I didn't want to be a technical gypsy."

Although a majority of independent consultants have substantially increased their income, it comes at high price — long hours and tireless marketing. DP staff members grumble that consultants are making $75 per hour and calculate that rate out to 40-hour weeks. But few independents bill out more than 20 hours per week, and they must pay all overhead costs, including insurance. When they are sick or on vacation, no money comes in, and they must constantly market themselves.

"Financially, it is more lucrative, but you can't do it just for the money," Gershon says. "It is long hours and hard work. If you are in it just for the money, you're better off with a full-time job." Becoming an independent has other considerations. "There aren't any test paths," O'Flaherty explains. "If you can get enough customers to agree with you, you're a consultant."

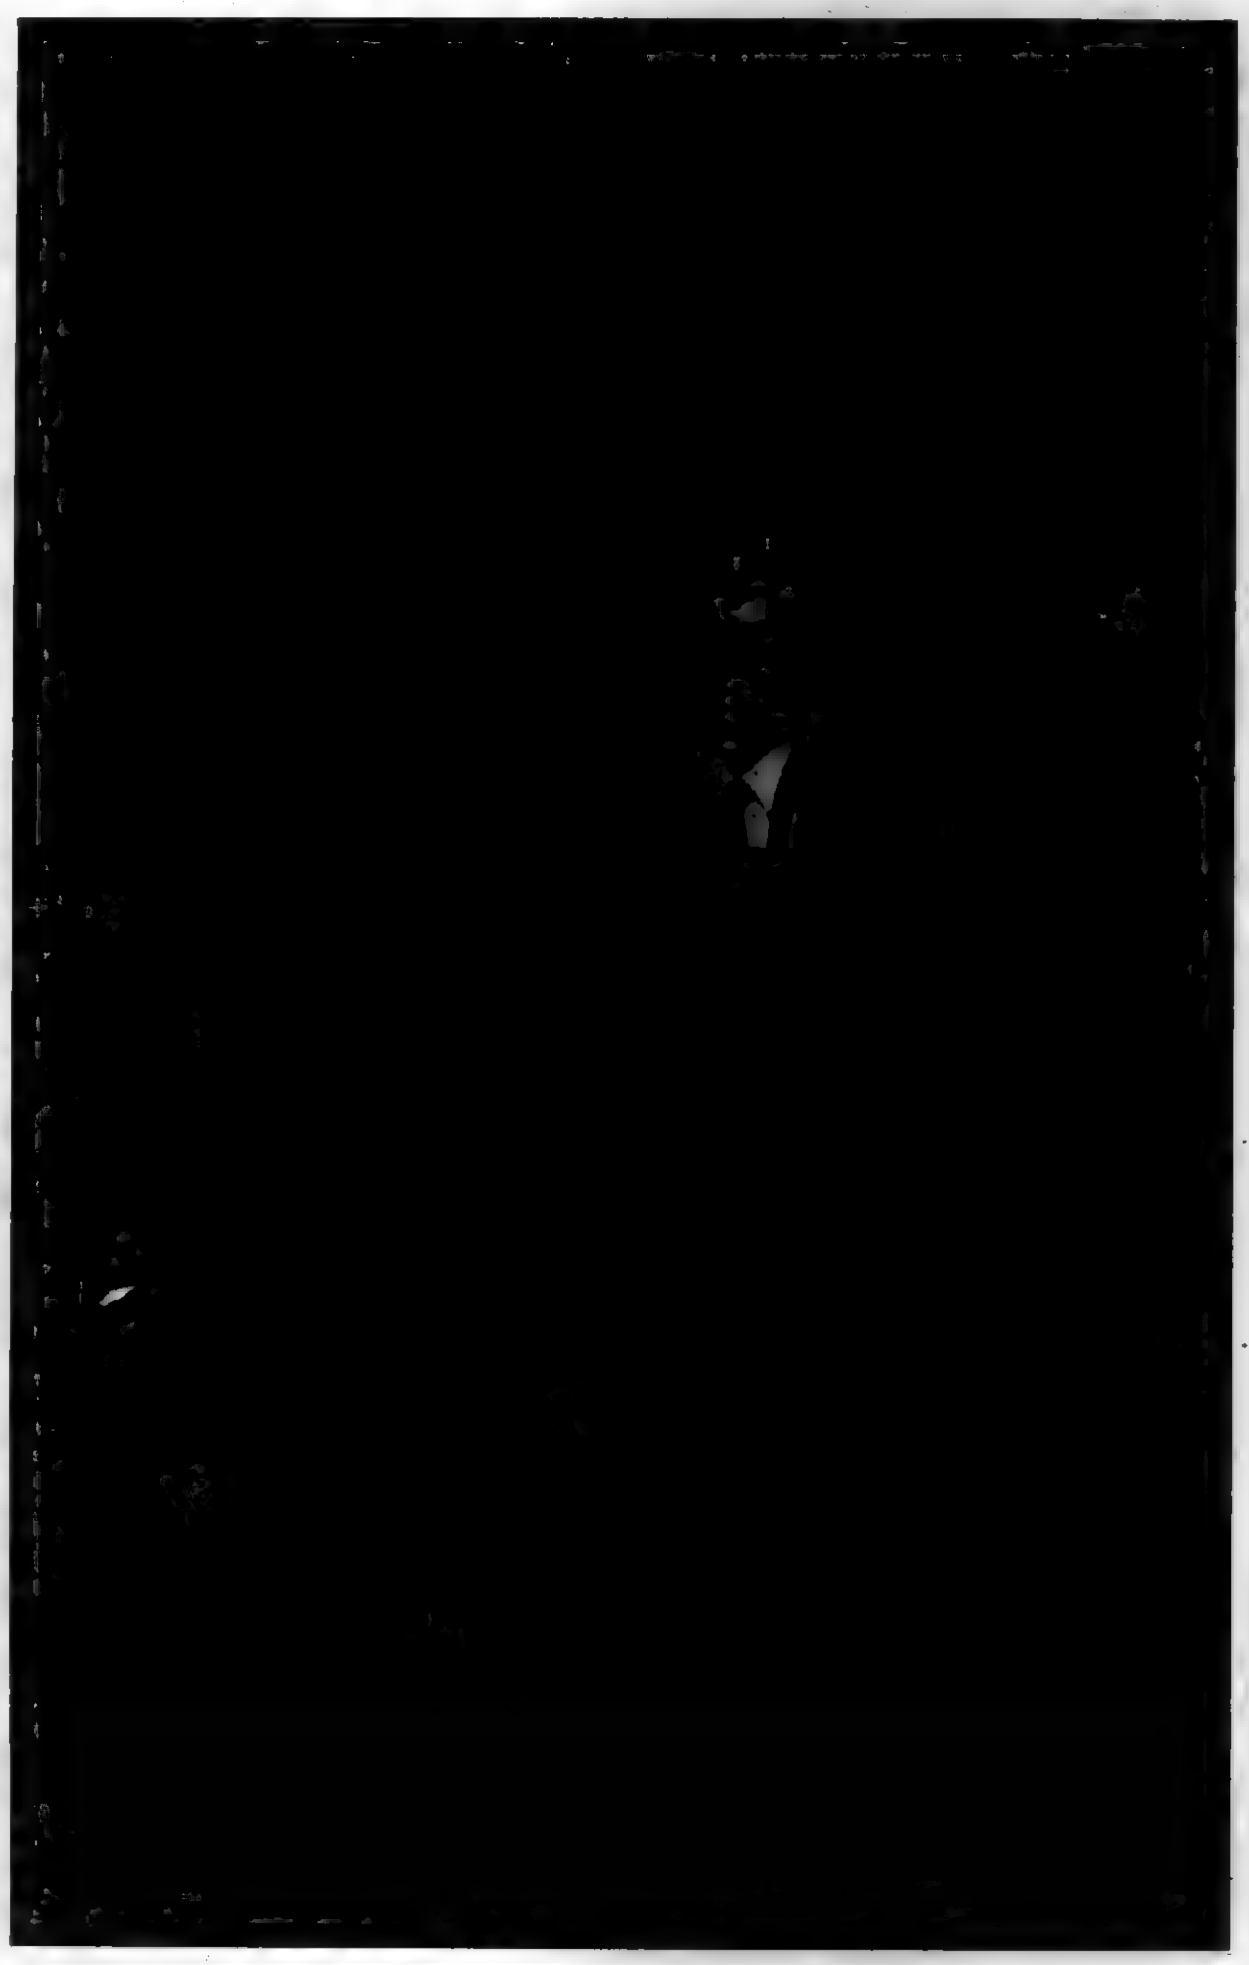
Getting enough customers, of course, is the tough part. Independent consultants tend to spend nearly half their time marketing their services. The advantage they offer a client is the kind of personalized attention a large firm might lack. "We find that we compete with the Big Eight firms," Stice says. "We go in behind them to a client who is disappointed with the work they've done. It happens often."

Another advantage of the independent is price. "A Big Eight firm has to charge at least three times what we do just to break even," says O'Flaherty.

Although some independents have found lucrative niches within large Fortune 500 companies, the majority devote their energies to the small to medium-size businesses that want less expensive, more personal service. The most successful independents have focused on a specific, technical or managerial need and have built reputations around that capability.

Dean Hiller, president of D. L. Hiller & Associates in Sterling Heights, Mich., specializes in implementing office systems in small manufacturing businesses. He is heavily involved in networking and systems integration using personal computers and finds that, despite working 60- and 70-hour weeks, he still needs additional help.

For Hiller and other independents, a key function of the business is to refer work to other sources if they feel either unsuited or too overburdened to undertake it. Networks of consultants, usually connected via organizations such as the Independent Computer Consultants Association, help spread the work and the wealth around.



Research firms. These firms — International Data Corp. (IDC), Yankee Group, Dataquest, Inc. and the Gartner Group, Inc. among them — are perhaps the most visible of all consulting organizations. Pure consultants — those who do hands-on project consulting — will take umbrage at these research organizations calling themselves consultants, however. In the press, they are often identified as industry analysts, and that is perhaps a more accurate term.

These firms generally serve as vast information resources, gathering and analyzing data for clients rather than directing specific technical DP or MIS projects. According to Tim Caffrey, director of strategies for microcomputers and office systems at IDC, the difference between the research firms and the consulting firms is the way information is delivered. IDC, for example, uses its continuous information service — a telephone hotline for customers — newsletters, reports and seminars to deliver its message.

IDC customers are generally served by these options rather than by on-sight presentations, and they pay anywhere from $15,000 to

Update

$20,000 per year for their subscriptions. "We get calls about anything you can imagine — software evaluation, optical disks, micro networks, technical assessments, vendor viability and particularly what other users are doing," Caffrey says.

Despite the distinction between the research firms and other consulting outlets, the bottom line is generally the same. "We help people maximize the return on their investment in technology," Caffrey says.

Aside from all of these consulting options, the DP or MIS manager has still more from which to choose. The vendors themselves offer both hardware and software consulting on their specific products, and data processing service houses provide contract programming for firms seeking impermanent solutions to their staffing problems.

Organizations serving as consulting middlemen are also springing up as the need for high-tech consultants proliferates. Technology Transfer Institute of Santa Monica, Calif., is a seminar bureau representing such top names as James Martin, Amy Wohl, John McQuillan and Harry Newton. The firm recently began offering consulting services, matching its noted speakers with clients seeking specific strategic advice.

Many large DP shops find themselves bringing in former employees who have become consultants. Cordes of Raymond Kaiser Engineers has done so with success. "We've had no problems bringing someone back in. We know their true talent, and they can get the job done without being hired permanently," he says.

At DEC, former full-time employees regularly return as consultants to work on a contract basis. As a vendor, DEC has unique problems in both hardware and software development and finds it beneficial to bring in ex-employees who understand the problems. "We have employees who quit on Friday and come back as a consultant on Monday," says Noel Negroni, manager of software and consulting acquisition. "It's a way to retain highly qualified people who would rather not work full-time at one company."

Setting the rules

"When the client doesn't manage the consultant, the consultant ends up managing the client," Hammer warns. It is a tenet upon which consultants and savvy users agree. Finding the consultant is just the first step. Establishing a set of ground rules both parties agree to is the next essential directive.

Though clients generally understand that they have a problem that needs to be solved, consultants are often surprised to find that no clear definition or direction has been established to do the job. "It has been my experience that the value a client receives from a project is very strongly correlated with how effectively they manage the project," Hammer says.

It becomes incumbent upon the consultant, therefore, to do serious preplanning with the client to avoid misunderstandings and disasters down the road. "Most projects fail either because of incompetence on the part of the consultant or not doing enough client interface work prior to starting," according to Dean Hiller. Hiller says that the absolute prerequisites for any consulting job include the following:

Hammer

- A good proposal with clearly stated objectives — in other words, what are the deliverables?
- A definitive work plan.
- Enough preproposal work with clients to ensure that they are properly oriented to the time frame and cost of the project.

The large accounting firms tend to formalize the procedure to a greater degree than independents, although all successful consultants insist on clear, up-front guidelines. Allen Sneider, a partner at the Boston office of Laventhol & Horwath, explains that for extensive projects, his group creates an engagement letter. This letter defines the services, explains the charges and provides an estimate of fees. The project is done in phases with an initial feasibility study followed by implementation and maintenance procedures.

"When you are dealing with microcomputers, the consulting fees could cost more than the system," Sneider points out. "Therefore the service must be superefficient. Consulting has a high value, but it may be intangible, and some clients may wonder if it's worth it. That requires a lot of education."

As the price of hardware drops and consultants' salaries rise, it will not be unusual for consulting to cost as much, if not more, than systems, according to Sneider. "You have 32-

CONSULT from UPDATE/9

bit machines with powerful programs sitting on the desktop and they have the same capabilities as a supermini," he says. "It can be pretty dangerous to put a 32-bit supermicro on your desk unless you have some competent consulting along with it."

Consultants traditionally charge by the hour for time, and materials and rates vary. Lesser known independents generally charge anywhere from $40 to $150 per hour while the superstars can command fees up to $5,000 per day. The big firms generally charge an hourly rate — usually from $75 to $200 per hour — based on the experience of the consultant assigned to the task. Generally, the more inexperienced the consultant, the cheaper the rate.

At Peat Marwick, work is done on a fixed-fee basis. "An hourly charge makes the client feel uncomfortable," according to Bruckstein of Peat Marwick. "Whenever they call or stop you in the hall, they feel the clock is ticking." Clients rarely specify a price level when contracting with companies that charge by the hour. At Arthur Andersen, a client with an ongoing relationship might request a specific consultant to be assigned to the task, but generally the firm decides who to send based on the needs of the project. "Very seldom does anyone say, 'Give me a $125-per-hour person or [a] $175-per-hour person,' " Arthur Andersen's Moughamian notes. "We're delivering a product, a service, to them.

Adds Michael E. Simon, managing director of planning at Arthur Andersen, "There are two kinds of buyers. There are buyers who are really body shopping. They need a systems programmer and they go out and get one based on hourly rate and qualifications.

"The other kind of buyer is seeking risk aversion. If [he] selects the right consultant, there is a much higher chance of getting a system that really meets their needs. That person is buying project management and generally won't question what we feel is the right mix of people."

Some large firms that use consultants extensively have set up consulting acquisition centers to act as brokers between consultants and clients. At DEC, Negroni points out that thousands of consultants are under contract at any one time and all must be approved by his office.

In acting as a broker between the consultant and the DEC manager, Negroni can facilitate a smoother interaction for both sides. "By brokering these issues, we can reveal a lot of the problems that otherwise would stop us from getting the most out of the engagement," Negroni says.

Though cost may well be a crucial issue for smaller organizations, most medium to large users are less concerned with the final bill than they are with solving the problem. "Price is not even discussed," according to David Geary, director of corporate MIS for Kaiser Aluminum & Chemical Corp. in San Francisco. "Expertise is the issue."

"Trying to manage consultants by cost won't work," Negroni adds. "Once you need a consultant, you need him now."

Communications

Nonetheless, clients want to feel that they are getting their money's worth. Once a project is under way, constant communication is essential. "Communication with the client is critical," says Roger Birks, an independent software consultant in Phoenix. "You should bring screens and reports, prototypes of what you are doing, to regular meetings. It gives the client a chance to see and touch the project as it is going along. When the people managing the project are involved, you tend to get a more successful implementation."

Status reports, weekly or monthly meetings and constant two-way communication serves more than just a single purpose. For the client, it is a way to monitor progress and value. According to Scott of Dart & Kraft, the good consultants are often stretched to the limit keeping up with all their clients.

"Consultants tend to try to balance jobs, and you must make sure your job gets the attention it deserves," Scott declares. "By making sure they get to meetings and make deadlines, you will get their full attention. Also, it's a good way for irritating problems to surface. Consultants are always happy to respond because you might end up as [a] reference for them later."

For the consultant, it provides not only a chance to command client interaction, but an opportunity to disagree. Booz Allen's Howe points out that when asked for their best judg-

As a consultant to ITT's telecommunications division in Germany, he was among the first to take seriously the relationship between man and machine.

His passion, of course, has always been workstation design that's totally human-compatible. His accomplishments to date include the popular ITT 1700, 1900, and 9000 series 3270 compatible terminals.

Tilt/swivel monitors. Amber, green or color displays. Separate function keypads. Optional lightpens. Thanks to Horst, every ITT Courier product and every idea we incorporate into our new workstation systems is ergonomically years ahead of the competition.

Maybe that's why, in side-by-side comparisons, DP users and managers prefer the added humanity — and productivity — that's built into every ITT terminal.

For more information, contact your nearest ITT Representative. Or call the ITT Courier Sales Support Dept., toll-free at 1 800-528-1400.

> ***Independent consultant***

CONSULT

from UPDATE/11

ment, consultants many times will disagree with their clients on fundamental issues. "On every assignment there are going to be three kinds of issues: those in which the client agrees with us, those in which we disagree but over time come to an agreement and those we just agree to disagree on."

The forum of regular meetings allows those issues to surface throughout the project rather than lurking beneath the surface until it is too late to address them.

"Communicating means not only keeping up to date on absolute progress but also where you are on issues and viewpoints. It's an absolute disaster to go into the final meeting and surprise the client with a series of recommendations or conclusions that he hasn't had any insight into before," Howe says.

Pitfalls

Despite the best intentions, consulting engagements occasionally can and do run into problems. Successful consultants limit the number of pitfalls encountered by up-front planning. But even the most carefully outlined plan can run into snags.

Internal politics are often a major stumbling block to successful engagements. A consultant may be brought in by a manager who does not have high enough ranking to set plans in motion. Conversely, the consultant may find that the best people to provide input into a project may not have access to it simply because they are too low on the totem pole.

"It's frustrating when people who need to be involved in the decision-making process can't be due to the political realities," consultant Stice explains. "The best person to explain a problem may be a third-shift machine operator, but he may never get access to management."

"You need to interface with those who will use the system and get input as to what really happens in that setting," adds Richard Jacobsen, an independent consultant from Bloomington, Minn.

As mentioned earlier, there is often resentment from internal staff members as to what they perceive as the intrusion of a consultant. Top management will often ignore advice from internal staff members and welcome the same advice if it comes from an outside authority. They believe, as Hammer says, that an outsider is not subject to the same conflicts and political issues that color the thinking of the internal staff.

This prejudice puts consultants in an awkward position. The in-house staff may become uncooperative and resist consultants, making their job difficult if not impossible. "It's a very delicate situation," Stice says. "It's not your job to be a personnel administrator, but a lot of times you have to do that. The best way is to have one person to report to. You can't make six people happy."

Users have recognized this pitfall and have looked for creative ways to circumvent it. Coca Cola's Harris says that the DP/MIS director must try to explain to the staff candidly that the proper level of expertise is not available within the staff.

Others suggest bringing key personnel in on the engagement and letting a lower level supervisor oversee the consultant's work.

Consultants all have felt the frustration of reaching what they feel is the perfect solution only to have the client reject it. At the other extreme, consultants must avoid overdesigning a system that clients are unable to run once left alone. Some of the Big Eight accounting firms have been accused of this practice by government clients. They will reportedly design a system and then send their own high-priced talent to run it.

"It's one thing to be correct and another to be correct and impractical," Booz Allen's Howe states.

Although it has not become a common occurrence, clients must also watch to make sure consultants are

not sharing proprietary information with others. Many corporations require consultants to sign nondisclosure contracts to legally bind them. Elaine Bond, director of DP at Chase Manhattan Bank, has seen instances of a consultant taking knowledge to a competitor. "You can try to bind them legally, but it is a difficult administrative problem. It causes you the extra burden of managing proprietary information."

Sharing secrets, however, is self-defeating for a consultant. "Once they do it, they won't work again," DEC's Negroni says. "My impression is they don't share information."

Clients should also watch for consultants with packaged software solutions to sell. Users such as William F. Monteith, MIS director at Armco, Inc. in Middletown, Ohio, have seen consultants proceed through an entire engagement, only to unveil a packaged solution that could have been offered at the outset.

"These people have software packages on the shelf, and their recommendations are biased by that material," Monteith says. "We tend to exclude consultants with a package to sell." DP/MIS managers are cautioned to question a potential consultant up front about biases toward packaged solutions.

And finally, finding consultants who know as much as they claim to know is no simple task. In the complicated, unresolved disciplines such as telecommunications, systems integration and micro-to-mainframe links, "There are very few people who know what's going on," Raymond Kaiser Engineers' Cordes says.

"We needed help with a computer-integrated manufacturing system [CIM], and we've talked to a few consultants who claimed to know CIM," adds Geary of Kaiser Aluminum. "During the interviewing process, it was clear they didn't know any more than we did."

The difference between true and imagined expertise is also apparent in strategic consulting. Management consulting firms boast of helping create a competitive edge through information systems, but that is easier said than done.

"There aren't too many consulting firms that are very good at providing a competitive edge," Harris says. "They may say they are doing that, but most aren't. With the exception of the financial services industry, very few businesses are making any significant use of computer systems to gain a competitive edge."

Users, therefore, must seek out organizations similar to their own and find instances of successful consulting engagements. These samples and resulting references can make a substantial difference between satisfaction and frustration.

Future trends

Consultants agree that in the next few years, the technical issues will become less important as organizations focus on gaining a competitive edge using technology. Clients, ADL's Allen points out, are becoming more self-sufficient.

"In 20 years, you won't hire a consultant to help implement a decision support system," Allen says. "That will be a commodity item. Consultants will be called upon to educate people on how to manage information-intensive corporations."

In the near future, however, consultants face a stiff challenge. They must stay abreast of changing technology while facing increased and tougher competition. As the consulting ranks continue to expand, the good jobs will be harder to find.

Though the large firms continue to enjoy plenty of engagements, the field has changed subtly in recent years. Marketing has become critical to both large firms and independents as users grow more savvy about their needs.

"In the early days, marketing was sitting one foot closer to the phone than the other guy," Broadview Associates' Poppel says. "But the days of waiting for the phone to ring are well past. Marketing is not just getting yourself chosen from a group of competitors; it is often getting the prospect to understand they have a need."

According to Moughamian of Arthur Andersen, the business is getting more complicated. Now that sophisticated customers have installed personal computers, local-area networks, operating software and telecommunications equipment, they want not only to tie it all together but also a single vendor to do that for them.

"It's a complicated world," Moughamian says. "Your competitor one day may be your partner the next."

Consultants also believe that there will be no letup in technological change, and, therefore, work should continue to be plentiful.

"If the rapid pace of change keeps up, I expect the consulting business to thrive," Hammer says. "Personally, I see no end to the change in sight. All the reports of a slowdown in the computer industry are temporary and do not reflect the end of the party.

"If you look at the the world from 40,000 feet, the impact of information technology on U.S. business has been almost insignificant thus far," Hammer continues. The impact has been minor compared to what we are going to see. Companies don't do business in a markedly different way than before computers because of computers. But that's about to change. And consultants who do a good job will continue to have important markets."

Perspective, as Howe of Booz Allen points out, is crucial to any consultant-client relationship. "A consultant can shed light on issues, provide objectivity, expertise, analysis, be a catalyst and motivator," he says. "But consulting is not a panacea to all problems." ■

Selling systems software? In September Computerworld Focus targets your market.

When it comes to systems software, there are no easy choices. So in the September 18th issue of *Computerworld Focus* on Software: Systems, we take a good hard look at what's available now. And what's coming down the road in the near future.

Topics will include all the building blocks available for a fully integrated system. Like information center packages. Operating systems. Data base management systems. Productivity tools. Data dictionaries. Decision support systems. Even things like artificial intelligence and fourth generation languages.

We won't just look at the pieces. We'll also discuss how they work together to provide a completely integrated system for companies of nearly every size.

And we'll target right in on your market. 128,000 paid *Computerworld* subscribers. Plus thousands of attendees at the Software Expo in Dallas in September.

So if you've got systems software to sell, we've got the perfect place to do it. The **September 18th** issue of *Computerworld Focus* on Software: Systems. But hurry, closing is **August 9th.**

White-collar computing: The professional as artist

By David Stevens

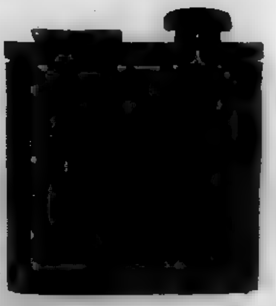
In the long run, the dramatic change brought on by office automation won't be in worker productivity but rather will be in working style — the "artistification" of the white-collar professional.

Most articles exploring the effects of automation on white-collar work fall into one of two classes: paeans to productivity or bleak visions of the physical and mental consequences of various forms of "technostress." So far, scant attention has been given to how the computer-assisted personal workstation can be expected to change the fundamental nature of white-collar work.

There are two kinds of change that computers can effect in the professional workplace. They can speed the processing of work in the traditional style, and they can enable fundamentally new styles of work to emerge.

One of the primary traditional office tasks is the transcription of a professional's ideas and preliminary drafts from one medium onto another. Much of the discussion of the increased productivity of the automated office centers on the ease and speed with which these transcriptions can be accomplished with the aid of a computer. Impressive as these improvements are, they are almost certain in the long run to be less dramatic than the changes in working style that can collectively be called the "artistification" of the professional.

The artistic nature of the pure programmer has an honored place in the folklore of the sociology of computing. This artistic make-up is supported by the nocturnal habits, eccentric behavior and declasse attire and coiffure of the stereotypical specimen of *homo programmaticus*, even if



Xerox
Telecopier 495-1

Xerox
Telecopier 295

In 25 seconds the Xerox Telecopier 495-1 will deliver high resolution copies of your documents by telephone anywhere in the world.

It gets your whole message across. Signatures, graphics, charts, even photographs are handled by the Telecopier 495-1's digital technology—perfect for high volume centralized telecopier operations.

The 495-1 can do even more. It can be linked to your Xerox or IBM PC via FaxMaster software. Together they are the ultimate time and money saver in facsimile communications.

The Xerox 495-1 using FaxMaster is highly automated and simplifies distribution with a few

Around the world in 25 seconds.

25 seconds from
New York to Tokyo

XEROX

keystrokes. It stores documents electronically, can forward messages automatically, and acts as an electronic mail terminal. Remote users can even call a FaxMaster hub and retrieve documents stored in their mailboxes. And it keeps a meticulous accounting of every activity, delivery, and pickup, worldwide.

FaxMaster automatically dials the numbers. If it reaches a busy signal, it will continue down the distribution list, then redial until it gets through. It can even transmit to multiple locations at night or on the weekend, when phone rates are lowest.

With the GI/G2 analog compatibility option, the Xerox Telecopier 495-1 can communicate with slower speed facsimile terminals. The RS-232-C option lets it convert and print ASCII encoded information from many other computers.

Xerox also offers a desktop digital facsimile terminal, the Xerox Telecopier 295. It's easy to operate, and will transmit your entire message in 25 seconds or less.

Both the 495-1 and 295 are compatible with other makes of facsimile terminals, and workstations that are part of Team Xerox.

To find out more about what Xerox Telecopiers and FaxMaster can do for your office, call us at 1-800-TEAM-XRX, extension 66, or fill in and send the coupon below.

We can make a world of difference.

it is not always evident in the beauty of his work product.

Computing work is generally assumed to attract such people. While this observation is true, it is not the whole story; there is also a sense in which it can be said that computing work creates such people.

A treasure chest of skills

The artistic urge has remained latent in many of us because we have lacked the skills necessary to express it. The personal computer is putting a treasure chest of those skills, and thus the ability to express ourselves, onto every professional desktop.

With the ability to express ourselves more freely will come the desire to create; with the desire (and a little secret practice) will come the exercise of this new capability. And with its exercise will come some elements of the artistic temperament.

As a result, the regular use of a personal computer-assisted workstation will convert the professional work force into a quasi-artistic work force. To some extent, this change will be the rather obvious result of the professionalization of certain design-oriented functions. To a greater extent, however, the change will be the result of the largely unanticipated artistification of the hitherto routine and pedestrian aspects of professional life.

Changing techniques

It used to be, for instance, that a professional would dictate or hand-scrawl the text of a document in preparation, describe any artwork to be included with the text and hand the resulting bundle off to a set of artisans for conversion into a readable whole.

This same professional, with the assistance of a computer, can now do his own document layout, including type fonts, faces and sizes. He can also execute his own artwork, ranging from simple line drawings through sophisticated graphs and charts to bit-mapped halftones of considerable complexity, all of which can be enhanced by automatic curve smoothing, line straightening, shading and texturing and other handwork-enhancing utilities.

This new breed of artistic professional will need as much management as did his preartistic predecessors. But because of his burgeoning artistic temperament, he will tend differently to conventional management practices and techniques. These changes should make the next few years interesting.

Freedom of expression vs. consistency of format. One characteristic of the artist is his desire to express his own individuality. In the professional workplace, this tendency will surface as an inability to leave any document alone.

In the old days, the difficulty of the mechanics often served to govern the urge to change things. Suggested alterations were generally local and limited in scope; sweeping changes were rare. Technology has made total reorganizations of large documents quite manageable and has provided every professional with the means to play with the appearance of a document.

The forms explosion that follows the introduction of the personal computer into almost any office is a wonderful example of this effect at work. Almost the first thing that the professional now does to demonstrate his newfound prowess is to create a new form, even though the old form is adequate and there are plenty of them left.

The precomputer professional developed the content of a document but generally left the establishment of its form and appearance to his administrative and clerical staff.

One result of this arrangement was that the semiliterate phrases penned by the brillant but grammarless professional could be turned into polished prose before being released. Another was that all documents originating from an office exhibited a common look, regardless of the personal idiosyncracies of the several professionals served.

In some cases, this common look extended beyond the department to encompass the whole organization, providing a central part of the corporate culture and personality. A person receiving such a document could tell at a glance its place of origin and, in the case of a long document, could quickly develop a fairly accurate feeling for how it would be organized.

Professionals are now free to indulge their own whimsies as to how their letters and memos should be formatted. They can create their own letterheads and forms, even incorporating their own logos should they so desire.

What the individual gains in freedom of expression, the organization loses in consistency of output appearance and style. For those situations in which flair, panache and a touch of poetry are appropriate, the organization's loss is the writer's gain; where regularity and uniformity are important, the writer's artistic license can generate confusion for the reader.

Total control vs. lost thoughts. One of the most frustrating things a writer can experience is dropped thought: He begins a sentence or paragraph, knowing the point he wishes to make, only to have it fade out of existence before he has captured it on paper. Sometimes he can recapture the mental context and the thought, sometimes not. In either case, the flow of thought is disrupted and the compositional task does not go smoothly.

In the precomputer days, the professional used the pencil as his primary recording device. With all its limitations, the pencil provided a comfortable and fairly rapid means of converting thoughts to text, so that relatively little thought had to

Combine The Power Of C
And
Your IBM Mainframe

What are the advantages of running C on your 370?

C is a high level language offering speed, power and flexibility. When you combine this with the IBM 370, you've got an unbeatable environment for software development. In addition, C lends itself to many different types of applications, is highly portable to a number of diverse CPU architectures and is the basis for a wide variety of existing software. Clearly, the future of programming lies with C.

Why Choose Whitesmiths' C?

Experience. Whitesmiths has been developing C compilers for over seven years. We were one of the first to introduce C for the 370 and our experience is evident in the features we offer:

- Full implementation of the C programming language for the IBM 370
- Ability to run under VM/CMS and MVS, and to run interactively under TSO
- Ability to produce re-entrant code (discontiguous shared segments)
- Direct support for both EBCDIC and ASCII character sets
- Optional cross support for MS/PC-DOS, CP/M-86, CP/M-68K, VERSAdos-68K and CP/M-80
- Unlimited use of libraries in binary form
- Support for ROM-based programs
- UNIX-style compatible library
- Optional use of IBM or Whitesmiths assembler
- Support of full ISO Level 0 Pascal, extended to support separate compilation
- System and Machine Interface Libraries provided in source code-form

Call Whitesmiths' toll-free number for more information
1-800-225-1030

be devoted to the mechanics of the process.

The "artistified" professional, on the other hand, has assumed total responsibility for the appearance as well as the content of his document and can access a substantial armory of sophisticated tools that enable him to achieve the effects he desires.

He now has more options than in the pencil days — for example, he can use italics, boldface or underlining for emphasis instead of only underlining. However, the mechanics for invoking them are necessarily more complicated. Involvement with complicated mechanics is a substantial barrier to continuity of thought.

Immersion vs. insulation. The precomputer professional was insulated from the tedious mechanics of refining his work into publishable form. His handwritten drafts were transformed into type by the clerical staff. His hastily plotted graphs were redrawn neatly and to scale by the drafting department. His sketches blossomed into finished artwork under the hands of the technical illustrators. His cost distributions and spreadsheets were prepared by the accounting department.

When all of the pieces were satisfactorily assembled, he had only to review them for accuracy and then send them off for photocomposition. All of this happened out of his sight and, although people-intensive, appeared to happen automatically.

The people who did these things were specialists. They generally did their work quickly and well and did not require detailed direction from the professional. Direction was possible, of course, but it was discouraged. The goal was to free the professional of these petty concerns so that he could get on with his own more exalted work. And because more direct involvement was difficult and time-consuming, most professionals did, in fact, leave these details in the hands of specialists.

The computer-assisted professional, however, has a rather different set of assistants. Instead of a clerical staff, he has word processing and document preparation systems. Instead of a drafting department, he has charting programs that prepare bar, line and pie charts directly from tables. Instead of technical illustrators, he has picture-making systems that can take his own hand drawings and integrate them with standard modules extracted from a library or developed from scanning other illustrations. Instead of the accounting department, he has electronic spreadsheets to do his cost distributions and tabulations automatically.

In many cases, the final product is of publication quality when it comes off the terminal. The process is now truly automatic; it is done by a personal workstation instead of by people. It no longer happens out of the professional's sight or without his direct control, however. He must learn to shape the output of each process to his purposes and how to fit the collected results into a coherent whole. He must become directly involved in all steps of the process.

Of course, the professional could provide the specialists with access to his files and operate very much as before, but he will choose not to do this. A modern, hands-on personal computer with a reasonable number of features exerts an attraction as seductive as Lorelei. It is very rewarding to watch one's own creation take shape under one's own hands.

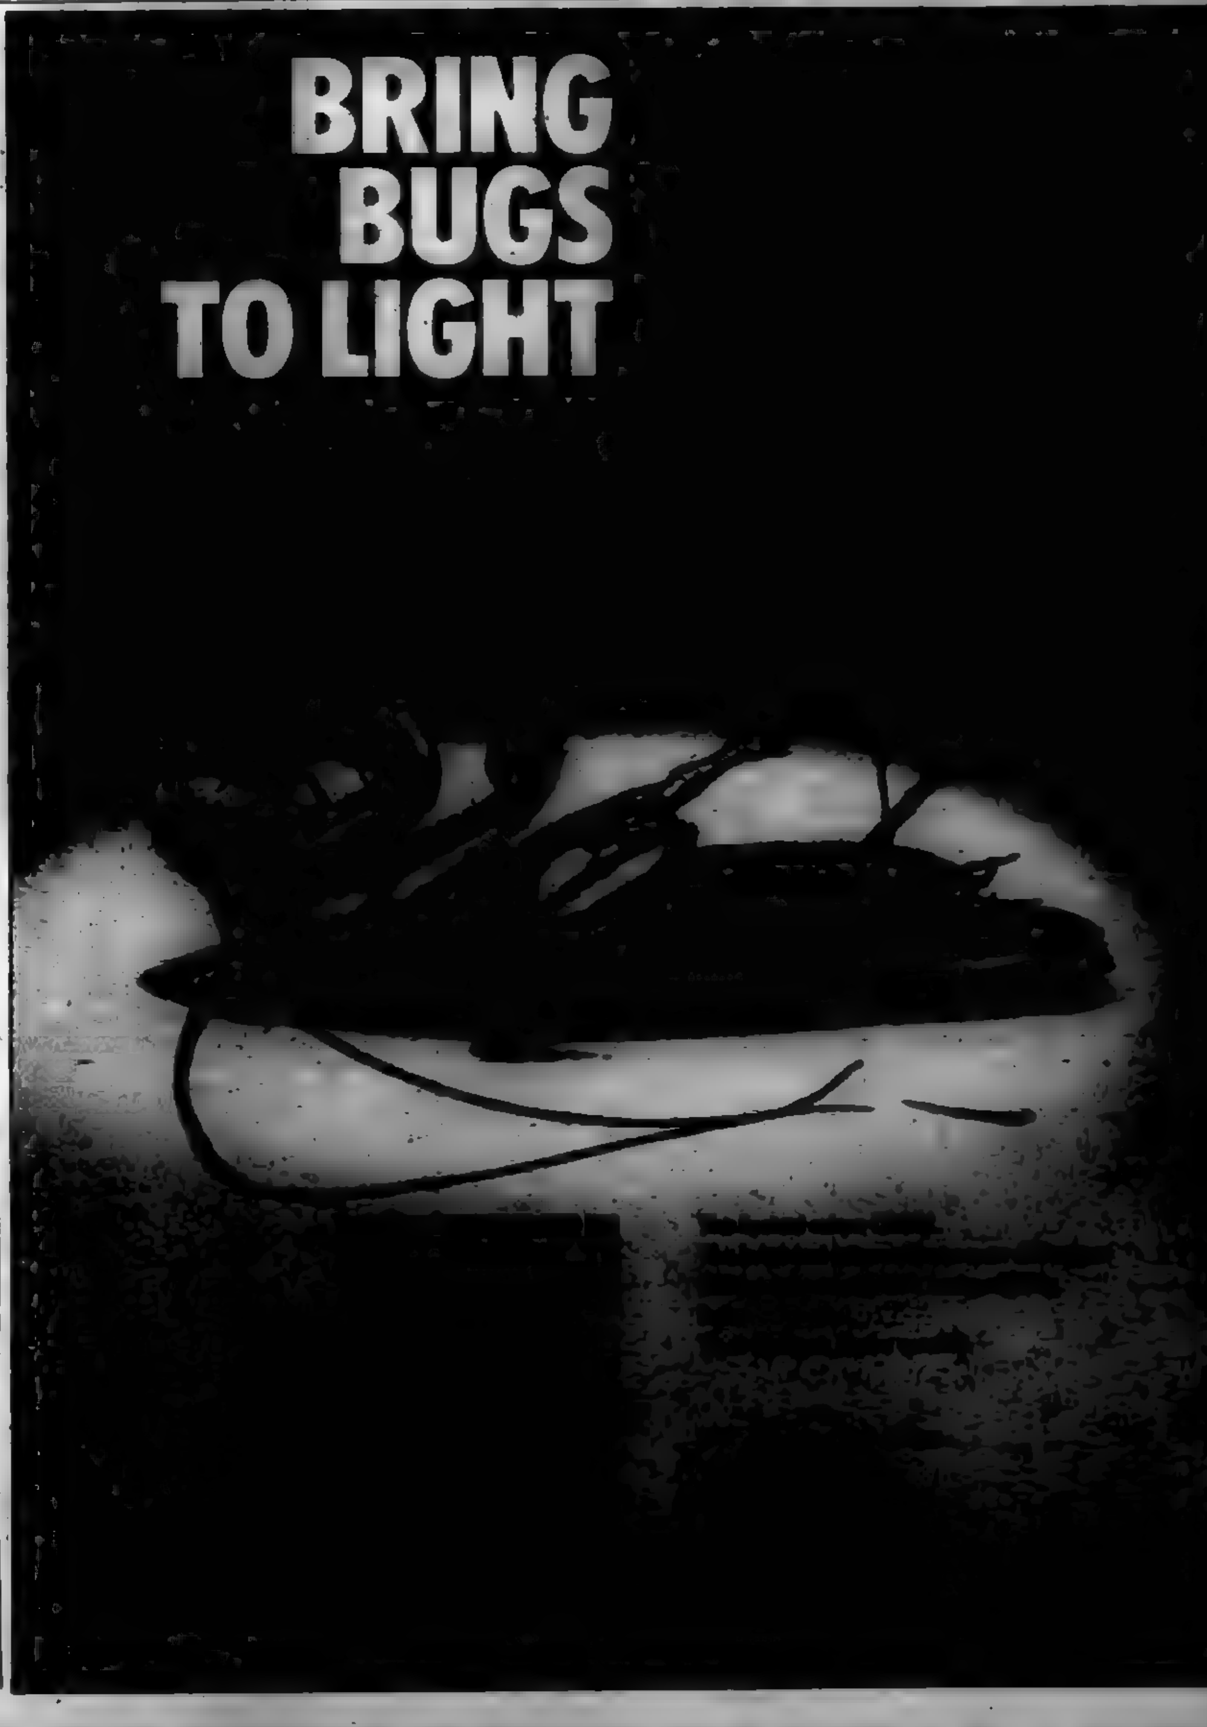
> ”
>
> *In the old days, the difficulty of the mechanics often served to govern the urge to change things. . . . Technology has made total reorganizations of large documents quite manageable and has provided every professional with the means to play with the appearance of a document.*

The computer assistance allows the professional to try out what otherwise he might have been reluctant to try, in public or through other people, in the precomputer days. He will make more modifications; he will change and change back. He will be more adventuresome than he would have been, for he no longer has to worry about the risk of appearing indecisive or the irritation that often accompanies the redoing of an apparently finished product.

The fascination of direct control accompanied by immediate feedback is immense, and it generates a desire to continue the cycle. The immediate feedback of the system seems to demand immediate feedback from the professional; the result is total immersion for long periods of time.

Play vs. work. The play aspect of the personal computer is closely related to the total immersion just described, for immersion tends to accompany enjoyment. One source of enjoyment is the sense of fulfillment that accompanies use of a computer-assisted workstation. This is, to some extent, a result of newfound competence, and perhaps it will disappear in time. For at least the next several years, however, the introduction of new products and capabilities will preserve the playful nature of personal computing.

Play is not necessarily bad; well-designed play can be instructive. Most likely, however, professional play on the personal computer will



take much the same form as did programmer play on the first couple of generations of mainframes. That is, there will be much limit testing and experimentation with the undocumented aspects of the systems available.

Nonproductive play does interfere with work. One side effect of the total immersion syndrome is the possibility that use of the personal computer can become so rewarding that it becomes an end in itself instead of a means to accomplish more constructive ends.

Instant response vs. lack of reflection. Not all minds work alike, but many of us find that much of our productive work is done off-line. When we wrestle with a problem awhile, then put it aside and come back to it, we often find that our subconscious was working on the problem during the interim and has discovered a way around a barrier or through a maze.

One of the joys of computer-assisted professional work is in the instant response of the system to the commands of the artist. No sooner does a professional think of something than it can take shape before his eyes. Carrying a document through from conception to final hard-copy form in one session is becoming increasingly common. While this mode of operation allows some amazing bursts of productivity, it also provides scant chance for reflection.

The subconscious mechanism also operates when any thought process is pushed into the background to make room for more immediate concerns. Thus, it is not unusual for the subconscious to take advantage of whatever dead time occurs between the successive steps of a traditionally organized project to suggest a modified approach that is preferable to the one originally in mind. In providing a computer assist that allows a professional to move from concept to camera-ready copy in one sitting, we are also depriving his subconscious of a chance to work on that task.

Avoidance of translation vs. incidental independent review. As noted above, the computer assist allows a professional to take a document from concept to camera-ready copy without the intermediation of specialists. One obvious benefit of this procedure is a reduction in the number of translating filters through which the product must pass. The result will be much closer to the original concept than was formerly the case and will be achieved with much less of the frustration attendant upon miscommunication.

A less obvious and less beneficial result of this procedure is the elimination of the several independent reviews that occur as each piece of the product passes through its specialists' hands. To begin with, the originating professional finds it necessary to express his intent clearly in order to ensure understanding on the part of the specialists. The specialists tend to read his work more carefully, for the material is unfamiliar, and they do not have the author's advantage of knowing his ultimate purpose; they have to make do with what he has written. As a result, they do not allow for the author's unexpressed intentions.

By contrast, it is extremely difficult for an author to proofread his own work competently, especially when he has been the typist as well. Traditional processing results in a document with fewer errors than is usual in a one-person process.

Faster results vs. more errors. The usual productivity claim for a computer-assisted system is that a person can produce more in less time. The rub comes when one asks, "Produce more what?" One answer — more errors — is implied by the loss of independent review noted previously. Another, similar answer is to be found in Parkinson's Law as applied to paperwork systems.

> *The usual claim for a computer-assisted system is that a person can produce more in less time. The rub comes when one asks, "Produce more what?"*

Parkinson's fundamental law is that work expands to fill the time available for its completion. When applied to paperwork systems, it becomes, "Reporting requirements expand until the most competent system in the field can no longer keep up with them."

In other words, as soon as the computer-assisted professional is capable of generating *n* pages a year, the reporting system will demand 1.5*n* pages. The result is that the professional is always behind and so is always eager to shorten the time from concept to product. He continues to expand his use of his personal computer system in order to avoid using specialists.

Professional as author vs. professional as secretary. The advantages of a computer assist for individual authorship have been amply described. There are also significant additional advantages for multiple authorship. Not only does each author enjoy the individual advantages, but the team is also enhanced by the ease with which text can be shared, edited, combined and moved, whether the several authors are colocated or separated by the width of a continent or an ocean. These amenities make it much easier to achieve an effective division of labor, a consistent style and a smoother blend.

On the other hand, a necessary consequence is that the professional becomes his own secretary. This situation is not necessarily bad, but whatever time the professional spends at secretarial work he does not spend at professional work. Moreover, the secretarial work in question is done more slowly than if it were done by a secretary, and it is done at professional, rather than at secretarial, wages.

Appearance of product vs. content of product. Very little of the discussion of productivity one sees in trade journals is concerned with what is probably the greatest advance provided by the computer-assisted workstation: the appearance of the product.

In the precomputer days, preliminary copies of documents-in-progress were rather ratty looking. Such appearance resulted not only from the fixed-pitch machines on which they were composed but also from less-than-adequate resolution, mimeo smudge and other artifacts of the precomputer office.

Today, however, the personal workstation can have an individual hard-copy device of virtually arbitrary quality, capable of printing anything his VDT can show. One suspects that the brave show made by these printers is responsible for much of the hyperbole surrounding computer-assisted workstations: It is not that more work is being done or is done better, but that the work looks better, regardless of content.

Programs that spell vs. people who spell. The decline in reading that has accompanied the growth of television has, as a side effect, contributed to the atrophy of spelling skills, at least in the U.S. An inability to spell a large portion of his technical vocabulary is a common failing of the young professional. This spelling deficiency is compounded by a similar inability to write coherently, much less cogently

There are two fundamental approaches to a problem of this nature: Teach the professionals the necessary skills or eliminate the need for them. The second alternative receives the most emphasis in the computing community. There are spelling programs, hyphenation programs, stylistic analysis programs, even some grammatical analysis programs.

As programs of this sort become more able, more of the proofreading burden will be shifted to them, and people will become less willing to do careful proofreading. These people may also become less able to do so, for the errors made by programs may be so different from those made by people that they are more difficult to detect. The result may be a serious decline in the overall quality of the finished product.

Friendly systems vs. friendly people. As the personal computer system becomes friendlier, the professional will be willing to spend more time with it. Until recently, spending a full day at a workstation VDT was impossible because of poor resolution and jitter; staring into a screen with such defects would produce eyestrain, headaches and, in extreme cases, disorientation. Friendly terminals feature rock-solid displays, extremely high resolution, nonfatiguing contrast and clear, precise graphics.

Friendly systems eliminate frustration as effectively as friendly terminals eliminate fatigue. As the barriers to extended use fall, the attractions for the personal computer systems will be more strongly felt, and the professional may spend more time communing with the system instead of communicating with people.

About the author

Reach the number one computer market in Western Europe — West Germany.

Your ad in CW Communications' West German publications will reach the largest computer market in Western Europe. According to International Data Corporation (IDC) the world's leading information industry research firm, the West German computer market is growing at an annual rate of 16% and total data processing expenditures are expected to reach $18.8 billion (U.S.) by the end of 1989. Our West German publications cover all segments of this prospering marketplace.

30,000 West German MIS/DP professionals rely on *Computerwoche* for up-to-date analysis and information on all aspects of the industry.

Microcomputerwelt reaches 60,000 business, scientific, educational and hobby microcomputer users each month.

PC Welt is read by 54,000 West German, Austrian and Swiss IBM PC users each month.

Computer Business circulates monthly to 15,000 readers. It provides a direct link between third-party marketers and potential business partners.

152,000 Commodore owners and buyers read *Run* each month for reports on new products and services in the Commodore marketplace.

Each month 60,000 Apple owners and potential buyers in West Germany read *Apple's*.

CW International Marketing Services makes advertising your products in West Germany, and around the world, easy. We have over 50 publications in more than 25 countries. For more information on our wide range of services, complete the coupon below and mail it today.

Honeywell has better office integration than Wang or IBM.

That's right.

Honeywell ties PC processing and terminals into one departmental system.

Introducing The Honeywell Office

Honeywell is about to change the way you think about office automation.

Because standalone and non-compatible product lines aren't enough to provide the most dramatic increases in productivity and corporate profitability.

The biggest increases in performance can only come from office automation capabilities like integration and networking that allow all systems to "talk" to each other—which is why we designed The Honeywell Office.

The Honeywell Office integrates office processing, data processing, networking and communications, and distributes these resources across a single, compatible product line of micros, minis, and superminis.

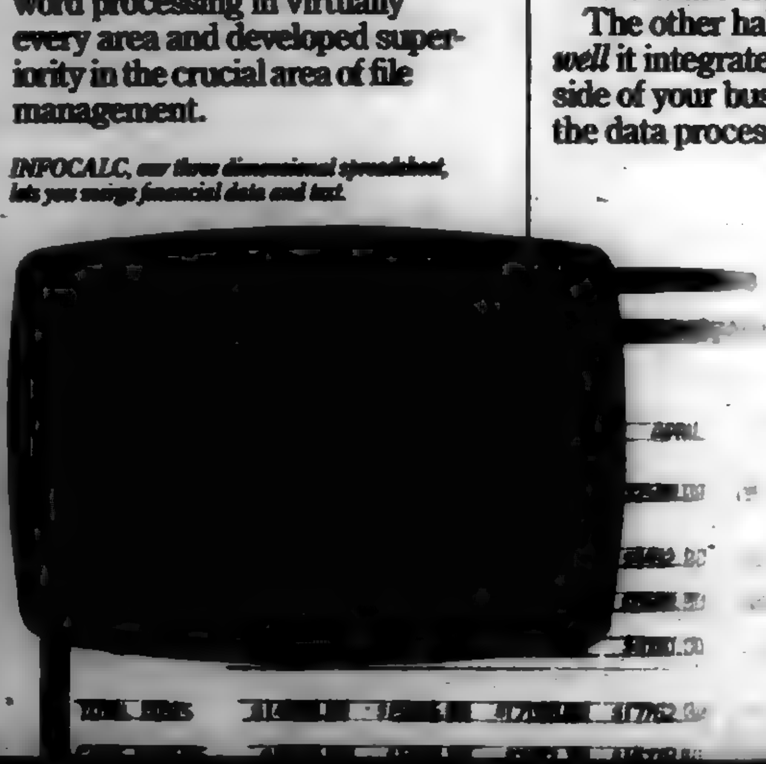
It's the reason why one customer credited our approach to office integration with helping to increase sales by 50%.

Here's how The Honeywell Office can help you manage and direct your information resources more efficiently.

Unsurpassed Office Processing

We started with competitive word processing in virtually every area and developed superiority in the crucial area of file management.

INFOCALC, our three dimensional spreadsheet, lets you merge financial data and text.



But we didn't stop there.

We integrated decision support tools and distributed networking capabilities so that your departments can transfer, share, and combine office and data processing information with simple commands. Without unnecessary steps. Without costly duplication of efforts.

InfoCalc, our integrated spreadsheet, lets managers access information from the department across the country as easily as the sales office from across the corridor.

There is also a database management capability that allows professionals to set up their own departmental databases.

And that's only half of it.

The other half is how *well* it integrates the office side of your business with the data processing side.

Flexible Data Processing

No word processing vendor can integrate the extensive array of data processing products you'll find with The Honeywell Office.

The Honeywell Office provides unrivaled flexibility by combining office and data processing into one distributed, departmental system. It supplies integrated transaction processing, database management, program development tools, query and report, data entry and specialized industry applications.

So now your accounting, marketing, and other departments can access and control their information.

*Over 2000 installations.

And when it comes to writing new applications, we offer a full complement of programming languages that include BASIC, COBOL, FORTRAN, ASSEMBLY, ADA, C, RPG, and PASCAL.

Quite simply, The Honeywell Office gives you a better growth path, stronger database management, and greater systems flexibility than our competitors.

Honeywell.

Advanced networking lets you connect all your departments.

Integrated Networking and Communications

Honeywell expertise in networking and communications helped the Metropolitan Life Insurance Company create one of the largest distributed branch office networks of its kind.

Over 1300 Met Life district sales offices in North America are automated using our DPS 6 minicomputers, linked through an SNA network that supplies reliable branch office-to-IBM host communications.

Unlike competitors who require mainframes for network control, we aren't limited to creating star networks. Our ISO based Distributed Systems Architecture (DSA), gives you the flexibility to configure ring, mesh, peer-to-peer, and other styles of networks.

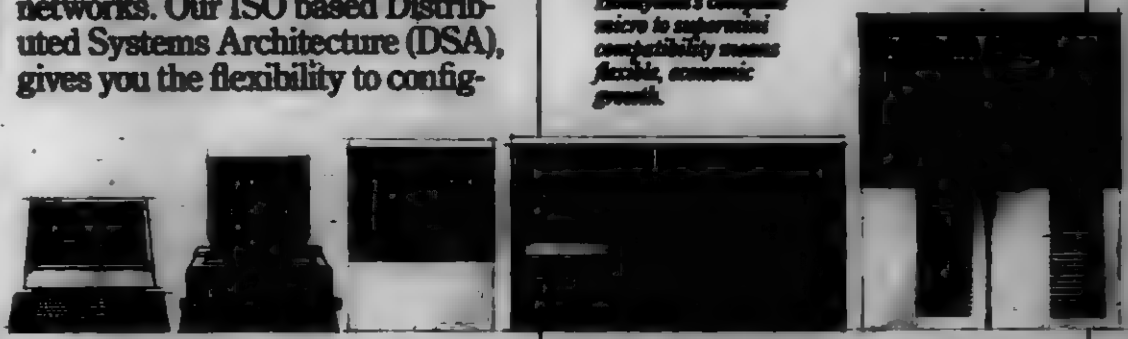
For local and remote user-to-user communications, our integrated electronic mail helps minimize network costs by letting you route your mail and documents in economical quantities, and prioritizes transmission by time of day.

Finally, The Honeywell Office lets you access network services such as CompuServe, Dow Jones, The Source and Westlaw right from your desktop.

Complete Micro to Mini to Supermini Compatibility

From the very beginning, The Honeywell Office was designed for complete compatibility from top to bottom. Compatible hardware. Compatible software. And compatible communications facilities.

One consistent interface is presented to all systems, small and large, permitting the virtually limitless exchange of information. Standard menus and prompts provide major user training benefits. Upgrade options are more flexible and economical because all systems can be linked together.



Honeywell's complete micro to supermini compatibility means flexible, economic growth.

Service and Support that Make All Systems Go

The Honeywell Office is backed by TotalCare,™ our comprehensive nationwide support program.

Uptime, after all, is everything, and TotalCare™ provides everything you need in programs and services that can be tailored to help meet your requirements.

The Honeywell Office The Smarter Choice

The Honeywell Office reflects a strong commitment and adherence to a standard interface, state-of-the-art technology, and a modular, open ended design, so that your office can grow as your needs do.

Honeywell

QUICK!

Name the fastest VM dump restore, and the fastest VM sort program.

(SYBACK & SyncSort CMS. What took you so long?)

Call (201) 568-9700.

Meet our supersonic systems.

If you didn't choose SYBACK and SyncSort CMS as the fastest in their categories, *do not go directly to jail.* But read this very, very carefully.

SYBACK, our fast dump restore for VM systems, and SyncSort CMS, the only high-technology sort for VM/CMS, represent a great technological leap forward. No other programs of their type can provide all three of the following positive advantages:

(1) THE FASTEST VM PERFORMANCE: SYBACK and SyncSort CMS make data move like greased lightning. Compared to their "competitors," these programs can save a tremendous amount of computer resources:

- **50% in Elapsed Time;**
- **45% in VTime;**
- **56% in TTime;**
- **75% in SIOs.**

These savings are the result of our exclusive Fluid Buffering Technique (FBT). First developed in OS and DOS sorting, we've now extended the benefits of FBT to VM backups and sorts.

(2) THE BEST VM PRODUCTIVITY: SYBACK and SyncSort CMS have tremendous operational flexibility and user friendliness. They're rich in features designed to reduce human intervention in backup and sorting:

- **SYBACK**—Automatic backup based on CP directory • Stand-alone restore capability • Incremental backup facility • Catalog of backup operations • Multi-tasking and execution under CMS • Interactive command processing • Standard-label tape support • Callable by user programs • DASD to DASD conversion and copying. Much, much more.

- **SyncSort CMS**—Sorts CMS, SAM (OS or DOS), or VSAM files • Can be invoked from COBOL, PL/1 or BAL programs • Dynamically allocates disk space • Selects relevant records for sorting • Reformats records on output • Performs summaries of designated numeric fields • Produces reports with pagination, headings and dates • Can often produce simple reports in one day rather than, say, five. Much more, too.

(3) THE FINEST TECHNICAL SERVICE: Our Technical Service specialist are experts in their individual fields. You can count on fast, efficient, courteous service in both backup or sorting operations. More than 85% of all user requests for service are resolved within 24 hours.

CAVEAT EMPTOR: As with all performance software programs, the best way to find out what SYBACK and SyncSort CMS can do is to benchmark them yourself against your present programs.

That should help you make up your mind *fast!*

SYBACK • SYNCSORT CMS • SYBACK • SYNCSORT CMS • SYBACK • SYNCSORT CMS •

SOFTWARE & SERVICES

Tool vendors need tie to DBMS

SOFTALK
By John Desmond
CW Senior Writer

"Hitch your wagon to a star."
Ralph Waldo Emerson, *Civilization*

If you're an applications software vendor without your own data base management system, you must hitch your wagon to somebody else's DBMS or risk being done in by the gods of software market misfortune.

McCormack & Dodge Corp. is pursuing this strategy in a big way by offering mainframe software not only for IDMS, Cullinet Software, Inc.'s leading independent DBMS, and IBM's IMS but also eventually for Applied Data Research, Inc.'s (ADR) Datacom/DB and IBM's DB2.

"The DBMS is the variable we can change," said Robert Kelley, vice-president of product strategy for M&D.

Hitching M&D's Millennium series of applications to the stars in the DBMS galaxy is the company's current focus. William J. Fitzpatrick, new product development manager, describes Millennium as a "bubble" that works inside various DBMS systems.

"It's an environment to develop applications independent of the file access system. Millennium is a bubble in which the application sits. You move it into the different environments you want it in," according to Fitzpatrick

The strategy differs markedly from Cullinet's approach. Cullinet executives argue that only users of Cullinet software can take advantage of all the resources of IDMS. Cullinet also maintains that true integration can only be achieved by writing applications in a fourth-generation language with links to a specific DBMS. They argue that their company offers a total solution.

Two slightly contradictory directions

Info system gives execs quick data

By John Gallant
CW Staff

NASHVILLE — An executive information system is a little like a doctor. Senior executives may not consult it often, but it has to be there when they need it.

"The executive information system has to be at hand and ready when your top people need it," said James Hardwick Jr. at the recent Information Center Conference & Exposition here. "It gives them a chance to get into the bowels of the company's data when they need information quickly."

Hardwick spoke from experience. In his role as budget manager with R.J. Reynolds Industries, Inc. in Winston-Salem, N.C., Hardwick managed a development team of six people that built an executive information system for Reynolds' key management personnel. (In addition to its domestic and international tobacco operations, R.J. Reynolds owns Del Monte Corp., Nabisco Brands, Inc., Heublein, Inc. and Kentucky Fried Chicken.) The impetus behind the development project, Hardwick said, was a mandate from the chairman of the board.

According to Hardwick, the microcomputer-based system gives Reynolds executives rapid and flexible access to summaries of vital operational data and information from a variety of outside sources. It is geared to non-DP professionals and provides easy-to-understand menus that guide an executive to the information needed to monitor the company's performance against its competitors and its own plans.

The Reynolds executive information system, which took shape during a six-month span from conception to pilot phase, consists of IBM Personal Computer XT workstations linked via Digital Communications Associates, Inc. Irma boards to an IBM mainframe under TSO. A Hayes Microcomputer Products, Inc. Smartmodem gives users access to a Digital Equipment Corp. VAX-11/780 under VMS and

Bank counts on portable package

SCS provides fail-safe emergency check sorting

By Mitch Betts
CW Washington Bureau

FLINT, Mich. — It was 8 p.m. on Feb. 14 when the IBM 3890 magnetic ink character recognition reader/sorter went down at Genesee Merchants Bank & Trust Co. here, which depended on the equipment for managing its daily flow of checks. Light smoke was spotted in the computer room, probably from a melted circuit.

Daniel Overland, disaster recovery administrator at the bank, which has since been acquired by the National Bank of Detroit, said it took 47 hours of around-the-clock work by IBM service technicians and other specialists to bring the unit back to life.

But this disaster did relatively little harm to the bank's check processing operations, Overland said. While the repair crews worked, the Genesee staff took its checks and special disaster recovery software a few blocks down the street to Citizens Commercial & Savings Bank, where the processing was done on that bank's IBM 3890.

Working from 2 a.m. to 6 a.m. the next day, Genesee was able to capture one day's worth of checks — more than 100,000 items — in four hours, Overland said.

"What could have been a disaster in customer relations turned out to be not so bad," he said.

The portable software was the Survival Check System (SCS), a utility check processing package that enables banks to process their checks on another bank's IBM 3890 under emergency conditions. It is marketed by Vips, Inc. of Hunt Valley, Md.

SCS users said the key to the software is

Oracle announces portable version of IBM SQL/DS and DB2

Any application written for IBM's SQL/DS or DB2 relational database management systems will now run without modification on DEC, DG, AT&T, HP and several other manufacturers' minis, and a wide range of micros, including the IBM PC/XT and PC/AT.

Oracle Corporation introduced the first relational DBMS in 1979. Today ORACLE is the only relational database management system that is completely compatible with IBM's SQL/DS and DB2. Programs written for SQL/DS or DB2 will run unmodified on ORACLE.

Originally designed for IBM mainframes and DEC superminis, ORACLE is now available on a wide range of machines, from mainframes to PCs. And ORACLE includes an integrated set of 4th generation software tools not available with either SQL/DS or DB2.

■ Why not Cullinet, ADR or Focus? There is a clearly defined standard for relational database systems. It's called SQL, and it's from IBM. Both ANSI and the US Government are in the process of adopting SQL as the standard database language. The Cullinet, ADR and FOCUS software packages each implement their own unique database language - each one painting the user into its own corner. Since its inception, Oracle Corporation has provided total IBM SQL compatibility.

Few shops nowadays run only IBM mainframes. Why, then, even consider a database solution that runs *only on IBM mainframes?* Applications written with ORACLE run identically on mainframes, minis, and PCs. Because all versions of ORACLE *are* identical.

FOCUS, Cullinet and ADR offer either a limited subset, a completely different product or nothing at all (respectively) for the PC. And none have minicomputer products.

■ Why not just go with DB2 or SQL/DS? A relational DBMS simplifies but does not by itself eliminate application programming. Additional tools are necessary if users are to create and maintain their own applications.

DB2 and SQL/DS are relational systems, period. ORACLE is a relational DBMS plus integrated 4th generation software tools for application generation, report writing, color graphics and network communications.

Furthermore, SQL/DS and DB2 run only on IBM mainframes (and are somewhat unlikely ever to run on another vendor's systems). ORACLE runs on more IBM hardware and operating systems than do IBM's relational products.

■ What about Goldengate, dBase III, Symphony or Framework? PCs need more than PC software if they are to be usefully integrated with corporate data processing. Incompatibility with SQL, while serious, is not the only major problem with these micro packages. None provides an acceptable level of data security, integrity or recovery facilities. And their PC-to-mainframe links are functionally primitive and difficult to use.

To effectively link computers, all machines in the network should run the same software. Only ORACLE provides standard software on mainframes, minis and micros. Data and programs can then be shared among users of different machines, distributing the workload.

ORACLE is currently installed on over 1000 mainframe and supermini systems around the world, as well as on thousands of PCs. Oracle's customers include 8 out of the 10 largest U.S. corporations, as well as major foreign companies and government agencies.

For further information, contact Oracle Corp., Dept. C2, 2710 Sand Hill Rd., Menlo Park, CA 94025, or call 415/854-7350.

Generator version out

WALTHAM, Mass. — Cortex Corp. has released Version 3 of the Cortex Application Factory for Digital Equipment Corp.'s VAX/VMS environment.

The Application Factory applications generator now includes a graphics option and a report generator. With the graphics capability, application developers can prespecify data extraction criteria and design custom plotting templates for end users. Users can select graphics options from the application menu, name the data and plotting template and generate the graph.

Users can select from 18 different templates. The graphics option provides a custom-controlled floating text capability to position labels or comments anywhere on the graph, the vendor said.

The report generator allows users to develop custom layouts of multipage reports. Reports are specified through an interactive screen painting process at the terminal.

Application Factory Version 3 costs from $40,500 to $89,000, depending on the VAX model. The graphics option costs from $4,500 to $10,500.

Cortex is located at 128 Roberts Road, Waltham, Mass. 02254.

SAS beefs up System 2000 DBMS

Cross Memory Services support added to line

CARY, N.C. — SAS Institute, Inc. has announced Release 11.5 of its System 2000 data base management system (DBMS) with enhancements for IBM's MVS and CMS operating environments.

Cross Memory Services support for the System 2000 multiuser product has been added in Release 11.5, a spokesman said.

The enhancement reduces the common storage area and offers increased accountability and data security. The multiuser product also offers accounting log and data recovery facilities.

The enhanced System 2000 offers a security exit that allows users to log six types of security violations. The data base administrator password offers a new level of authority between the master password and secondary passwords.

In addition, the enhanced DBMS offers users the ability to store data as well as time in the diagnostic log and to set format options in the same manner as the print command. A CICS interface enables users to obtain 132-column teleprocessing output.

The release is available to current customers for no additional charge. New sites can license the System 2000 DBMS for $12,000.

In addition to MVS and CMS environments, System 2000 runs under TSO, DOS/VSE and CICS on IBM 370, 3030, 3090 and 4300 series processors. It also runs on Sperry Corp.'s Series 1100 under OS 1100 and the Control Data Corp. 6000 and Cyber series mainframes under NOS and NOS/BE.

SAS Institute is located at SAS Circle, Cary, N.C. 27511.

PC/Com software gets enhancement

ATLANTA — Mom Corp. introduced an upgraded version of its PC/Com host communications interface software.

Version 3.8 gives users an optional virtual diskette capability that allows them to store microcomputer files on the mainframe.

The link provides for bidirectional file transfers, including data, text and binary files, in an IBM 3270 network.

It supports IBM's CMS, TSO and CICS and runs on the IBM Personal Computer, Personal Computer XT and Personal Computer AT, AT&T Information Systems' PC 6300 and other compatibles.

Prices for components

The link costs $395 for the micro component, $400 for the TSO and CMS components and $2,000 for the CICS component.

The virtual diskette option costs $50.

The company is located at Two Northside 75, Atlanta, Ga. 30318.

The Software Professional's Job Fair

SOFTFAIR 85

SoftFair is different-specifically designed to help you search in new career directions. For the broadest possible view of your local software marketplace, SoftFair brings together technical managers and personnel representatives from 50 or more of each area's most desirable employers. No need for inconvenient phone calls, lengthy cover letters or work-time interviews. Just join us at the site nearest you and see what your experience has earned you at SoftFair.

SoftFair will be held on these days (Monday & Tuesday) from 4 PM to 9 PM at each location:

Sunnyvale
September 9-10
The Sunnyvale Hilton
Sunnyvale, CA

New York
September 23-24
The Roosevelt Hotel
New York, NY

Philadelphia
September 9-10
Sheraton-Valley Forge
King of Prussia, PA

Morristown
September 23-24
The Governor Morris Inn
Morristown, NJ

Waltham
September 16-17
Hillcrest Function Center
Waltham, MA

Chicago
September 30-Oct 1
The Westin-O'Hare
Rosemont, IL

Atlanta
September 16-17
The Waverly
Atlanta, GA

Dallas
September 30-Oct 1
Holiday Inn-Crowne Plaza
Dallas, TX

Exciting career opportunities are available for experienced software professionals in a variety of **Software Engineering, Scientific** and **Business Applications** areas related to **development, support, implementation, training, quality assurance, technical writing, sales, marketing** and **management.**

A minimum of two year's on-the-job experience is required.

If you can't attend **SoftFair**, send a resume indicating the location in which you are interested for distribution to attending companies. Software Career Link, 15 Olde Boston Square, 270 Littleton Rd., Westford, MA 01886.

SoftFair '85 is sponsored by Software Career Link serving equal opportunity employers.

PRODUCTIVITY AIDS

■ Advanced Systems Concepts, Inc. has introduced a reverse compiling service that can retrieve lost source codes from compiled IBM RPG programs running on IBM's System/38.

The service uses System/38 assembly-level machine interface programming to decode and analyze the program, the vendor said. Information contained in the program template, symbol table and break offset mapping tables associated with the program is referenced in order to retrieve the source.

The reverse compiling service costs 90 cents per line of code retrieved.

Advanced Systems Concepts, Suite S, 1350 Remington Road, Schaumburg, Ill. 60195.

APPLICATION PACKAGES

■ Intersoft Systems, Inc. has announced a communications package that transfers data between Burroughs Corp. minis running its CMS operating system and its B20 micros.

Datalink 100 consists of a file transfer program, terminal emulation software and data format conversion programs. The product works with micro packages that support IBM's Data Interchange Format and the Symbolic Link data format. Unformatted data from a minicomputer can be loaded into a micro word processing package.

The package can print reports with devices that work with the B20 or IBM Personal Computers.

Datalink 100 has an initial site licensing fee of $1,400 and an annual maintenance fee of $200.

Intersoft Systems, Suite 114, 10550 S.W. Allen Blvd., Beaverton, Ore. 97005.

■ Computer Management Dynamics, Inc. (CMD) has announced a report generator for Wang Laboratories, Inc. VS minicomputers.

Command reportedly enables users to create up to 15 files with any combination of fields and multiple criteria for record selection. The software uses standard Wang utilities such as Control File Utility.

Other features include multiple sort capability, subtotaling and user-defined calculated field capability, the vendor said.

Command for the Wang VS is priced between $5,000 and $10,000, depending on CPU size.

Computer Management Dynamics, 29 Riverside Drive, Nashua, N.H. 03062.

■ PDA, Inc. has announced three applications packages for insurance companies using the IBM System/38.

The Life Reinsurance Management system is designed for the administration of assumed, ceded and retroceded business. Modules include cession administration, billing, premium receivables and payables, reserve reporting, pool tracking, underwriting processing, claims reporting and client analysis. The product costs $140,000.

PDA's Accident and Health and Life Management system includes modules for policy administration, premium and reserve accounting, agency accounting, claims processing, financial and management reporting. The system is priced at $40,000.

The Stock and Bond Portfolio Management System for the IBM System/36 or System/38 assists users with management of an investment portfolio. It costs $10,000 for the System/36 and $15,000 for the System/38.

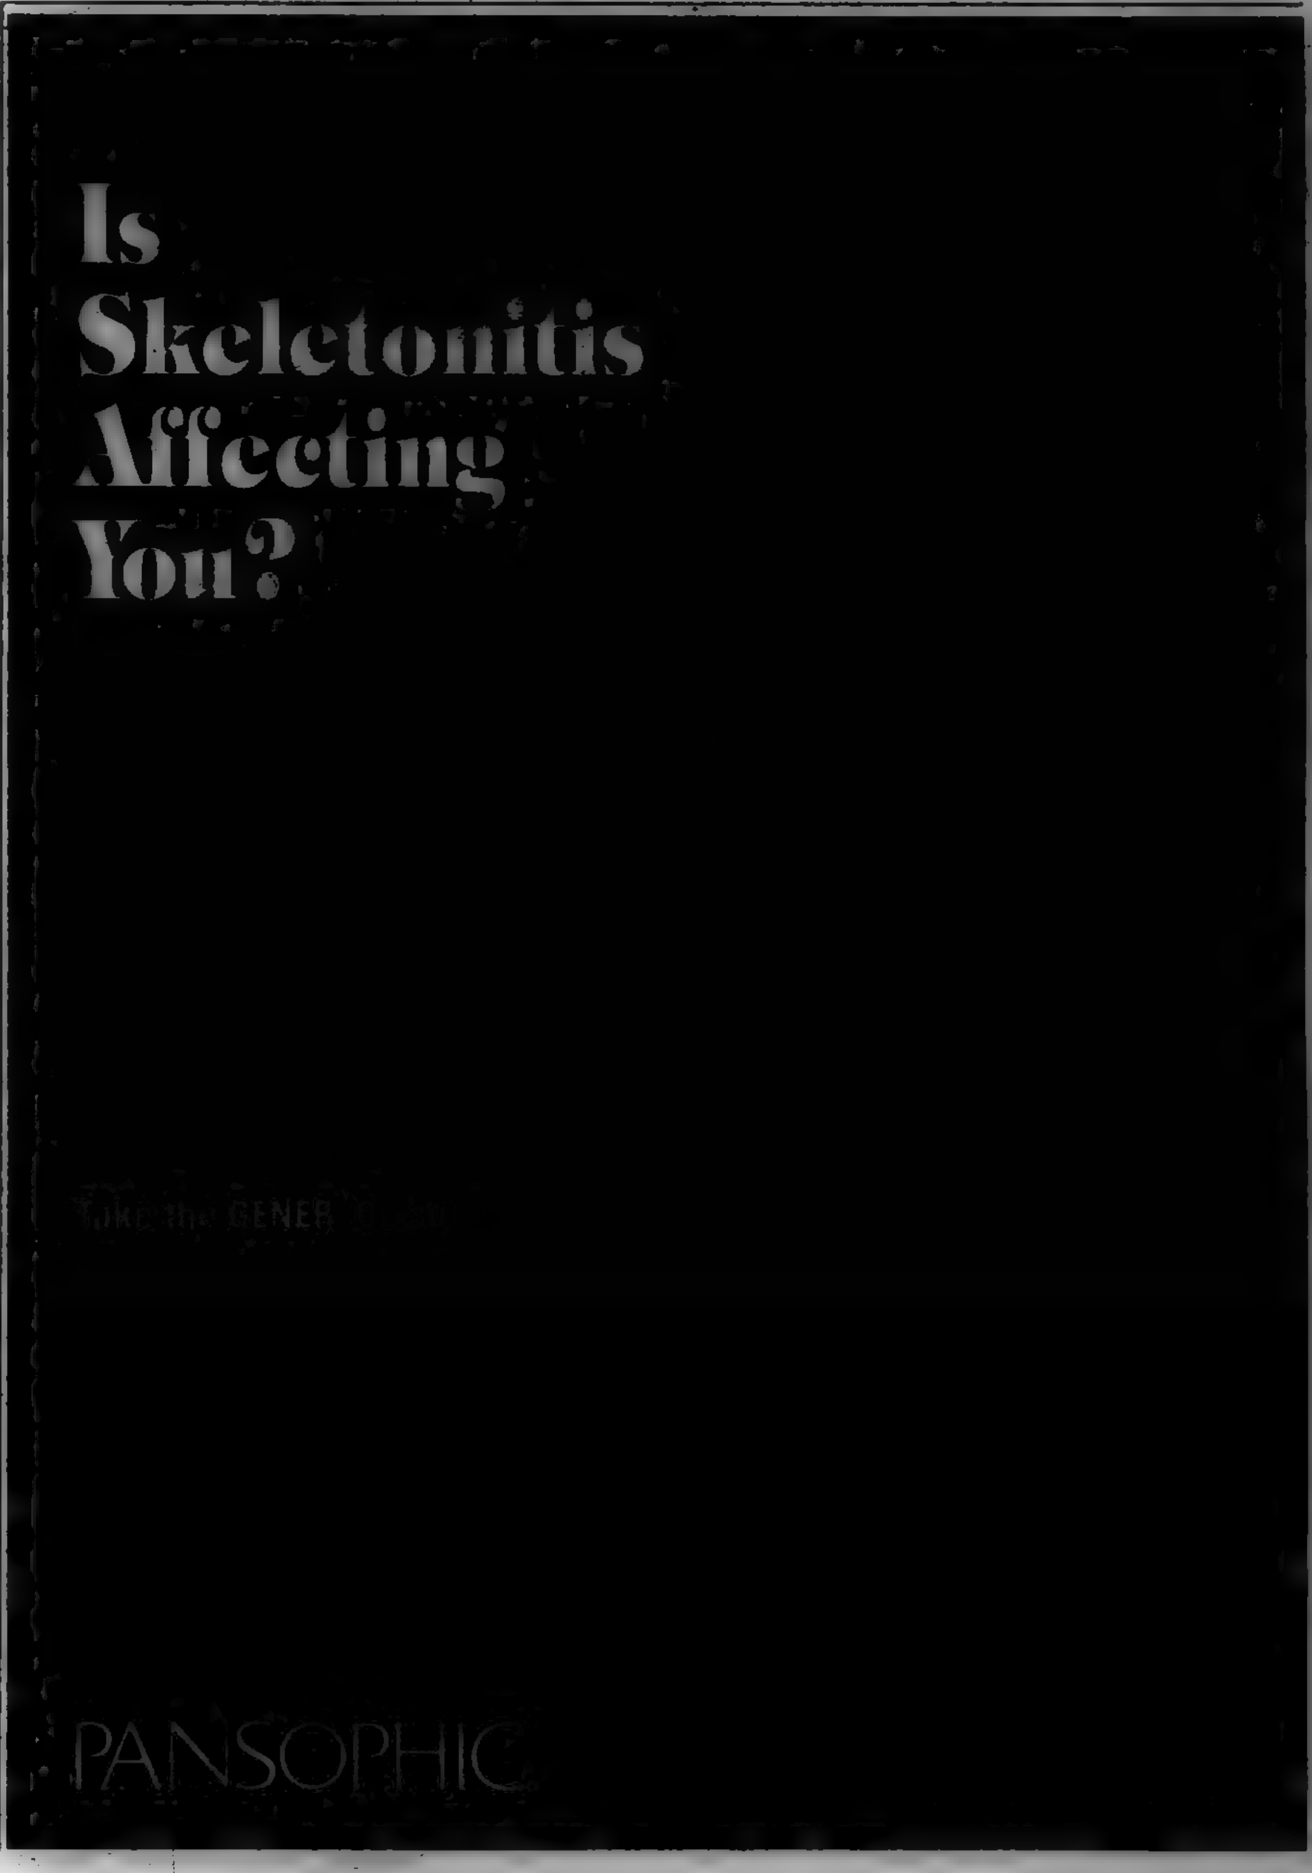
PDA, 11600 College Blvd., Overland Park, Kan. 66210.

■ Computer-Aided Design Services, Inc. has announced software that reportedly allows drawing files to be transferred between a Computervision Corp. Cadds 4 or 4X Designer V system and an IBM PC-DOS-based microcomputer running Autodesk, Inc. Autocad drafting software.

The Graphics Data Translator (GDX) consists of two software modules, the Autocad translation module residing on the Computervision mini and the communications features module on the micro. Users may develop drawing files on the Autocad-based workstation and upload them to the host or download host-generated files to the workstation.

Prices for the GDX are

Continued on page 46



Continued from page 46

$9,950 for the first Computervision system, $5,000 for each additional on-site CPU, $200 for each additional communications module and $125 for each additional communications software module to be used on a file serving network.

Computer-Aided Design Services, 1717 S. Orange Ave., Orlando, Fla. 32806.

■ Larry Miller Associates, Inc. has announced Market Manager, an on-line marketing system for the IBM System/36.

Market Manager can maintain mailing lists, assist with target marketing and telemarketing and store mailer, envelope and label information, the vendor said. The product allows users to define edit criteria and choose between sort or select functions using any sequence of criteria. It can also maintain parallel but separate files.

Market Manager is priced at $1,200.

Larry Miller Associates, 81 E. Queenwood Road, Morton, Ill. 61550.

■ ADP Network Services, Inc. has added graphics capabilities to its Apecs/8000 project evaluation and control system for the Unix operating system.

Apecs/8000 Version 1.8, which runs under Unix System V on Digital Equipment Corp. VAX and AT&T 3B processors, now allows users to produce bar charts, pie charts and line graphs.

Apecs/8000 is priced from $15,000 for supermicros, including DEC's Microvax II, to $150,000 on the DEC VAX.

ADP Network Services, 175 Jackson Plaza, Ann Arbor, Mich. 48106.

■ Software International Corp. has introduced Release 5.5 of its accounts payable package for Hewlett-Packard Co.'s HP 3000 minicomputer.

Enhancements include the elimination of all record numbers and the replacement of all sequential batch files with an HP Image data base of batch files. Also included are menu navigation capabilities that allow users to move from one function or screen to another, the vendor said.

Release 5.5 of the accounts payable package will be available in September and is priced at $19,000.

Software International, 1 Tech Drive, Andover, Mass. 01810.

■ Computerized Forms Management, Inc. introduced Formanager, a form generation package for AT&T Unix-based machines.

Formanager includes a resident data base of production standards listed by product code. Standards can be modified by the user, the vendor said. Users can also sort forms information from any combination of codes. The product allows users to detect duplication of forms and consolidate different forms.

Formanager is available for AT&T's Unix System 3 or 5.2 and for the IBM Personal Computer AT running Microsoft Corp.'s Xenix.

Base price of Formanager is $9,800 for a three-user system.

Computerized Forms Management, 880 N. York, Elmhurst, Ill. 60126.

■ Leland Computer Services, Inc. has announced an additional component for its Purchasing System for IBM's CICS and IMS.

The Leland Requisition Control System is said to manage the generation of a requisition and its resulting purchase order. Users may group requisitions into existing purchase orders and create a purchase order while assigning requisitions. The system's batch programs automatically generate requisitions for IBM's MRP and inventory accounting, allowing the Purchasing System to support those modules without modification.

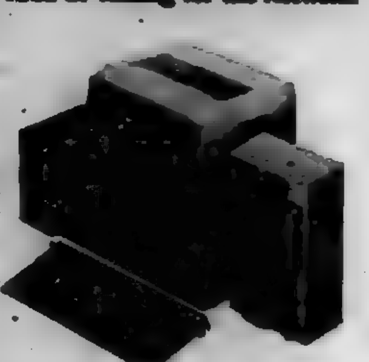
The Requisition Control System is priced at $10,000 for a perpetual license.

Leland Computer Services, Suite 146, 3601 Dunwoody Place, Atlanta, Ga. 30338.

■ Catalyst USA, Inc. has announced the Optimizer system for computerized control of stockroom operations, inventory and personnel. The packages runs on the IBM Series/1 minicomputer.

9-TRACK TAPE DRIVE

Tired of Waiting for the Network?



The solution to your PC to mainframe communications problem is available TODAY!

Qualstar's new MINISTREAMER brings full 9-Track 1600/3200 CPI interchange capability to the desktop at an affordable price. Available in both 7" and 10½" versions, the MINISTREAMER is an ideal alternative to expensive network systems.

If mainframe data interchange is a problem for you, please call us today!

Discover the most powerful

The IBM
Personal Computer AT.

Hold on to your hat.

The IBM Personal Computer AT (for Advanced Technology) is based on the advanced 80286 16-bit microprocessor. This remarkable computer will run many of the programs written for the IBM PC, up to three times faster. You'll be able to recalculate large spreadsheets in seconds and retrieve files in a flash. And it's ideal for IBM TopView, the new kind of software program that lets you run and "window" several other programs at once.

The IBM Personal Computer AT has got the power (and price) to surprise you. In many ways.

Compatibility, expandability, networking too.

With the IBM Disk Operating System, the IBM Personal Computer AT can use many programs from the fastest-growing library in the personal computer software industry.

The IBM Personal Computer AT is also available with up to 3 million bytes of user memory to run multiuser, multitasking operating systems such as XENIX™. Volume upon volume of information is available at your fingertips. You can customize your system to store up to 20,000 pages of information at one time. And its keyboard helps you use all of this computing power more easily.

This member of the IBM PC Family is a powerful stand-alone computer that can also be both the primary file server and a station on your network. With the IBM PC Network (which is so easy to connect you can do it yourself), the IBM Personal Computer AT can share information with IBM PCs, PC/XTs and IBM *Portable* PCs.

IBM Personal Computer AT Specifications

User Memory
256KB-3MB*
Microprocessor
16/24-bit 80286*
Real and protected modes*
Auxiliary Memory
1.2MB and 360KB diskette drives*
20MB fixed disk drive*
41.2MB maximum auxiliary memory*
Keyboard
Enlarged enter and shift keys
84 keys
10-foot cord*
Caps lock, num lock and scroll lock indicators
Display Screen
IBM Monochrome and Color Displays
Operating Systems
DOS 3.0, XENIX,* PC/IX 1.1
Diagnostics
Power-on self-testing*
Parity checking*
CMOS configuration table with battery backup*
Languages
BASIC, Pascal, FORTRAN, APL, Macro Assembler, COBOL
Printers
Supports attachment of serial and parallel devices
Permanent Memory
(ROM) 64KB
Clock/calendar with battery*
Color/Graphics
Text Mode
Graphics Mode
Communications
RS-232-C interface
Networking
High-performance, high-capacity station on the IBM PC Network*

*Advanced Features for Personal Computers

Get a hands-on, hats-off demonstration.

The IBM Personal Computer AT has the power, compatibility and expandability many PC users need, at a very appealing price.

For more information contact your authorized IBM PC dealer, IBM Product Center or IBM marketing representative. For a store near you call 1-800-447-4700. In Alaska or Hawaii call 1-800-447-0890.

According to a spokesman, the system determines the most efficient routes for batch or single-order retrieval when processing previously scheduled work queues or operator-entered issue orders.

The Optimizer system is priced at approximately $100,000.

Catalyst USA, 220 Oak St., Grafton, Wis. 53024.

■ **McDonnell Douglas Computer Systems Co. has introduced a Municipal Management System for Microdata Corp. business computers.**

Designed by Creative Computer Solutions, Inc., the Municipal Management System (MMS) consists of 16 modules including financial, inventory, equipment, payroll/personnel, purchasing, utility information system, licensing, parks and recreation and permits. In addition to the Microdata 4700, 600 and 9000, MMS works with McDonnell Douglas' relational data base management system.

Modules are priced from $1,500 to $8,000.

McDonnell Douglas Computer Systems, 17481 Redhill Ave., Irvine, Calif. 92714.

■ **SDK Healthcare Information Systems has announced a financial management system for health care organizations. The product runs on a variety of computers using the Mumps operating system.**

The SDK Financial Management system incorporates a query language, spreadsheet loader, report writer and downloading capabilities for transferring data to a micro.

SDK's Financial Management system software costs $20,000 to $40,000, depending on configuration.

SDK Healthcare Information Systems, 1550 Soldiers Field Road, Boston, Mass. 02135.

DATA BASE MANAGEMENT SYSTEMS

■ **Database Utility Group has unveiled Version 2 of Adabas Performance Analysis System (Apas) for Software AG of North America, Inc.'s Adabas data base management system on IBM CPUs running under MVS, DOS, CMS and VM.**

Apas Version 2 now allows users to gather Adabas command log statistics without writing them out on tape. It costs $8,750.

Database Utility Group, P.O. Box 4912 Federal Way, Des Moines, Wash. 98063.

■ **Datasolutions International, Inc. has released a data base utility for the Hewlett-Packard Co. HP 3000 system with HP's Image data base management system.**

The Command/3000 DBStatus reportedly checks Image data base capacities to help prevent the filling of Image files. DBStatus shows the capacities, current record count, space available, percentage full and warning messages for Image data bases.

The software requires a 1,600 bit/in. tape drive for installation.

The DBStatus package costs $200.

Datasolutions International, 55 Jefferson Blvd., Warwick, R.I. 02888.

BACKUP

from page 43

its two-part structure: the driver component is tailored to the installation's hardware and operating system and is installed at the backup site; the second component is a portable bank control file that contains such information as the stricken bank's account number structure and sort patterns.

That second component, the tape record of bank-dependent information, is transported to the backup site and installed when an emergency occurs.

'Would have been three days behind'

"Without the Vips software, we would have been three days behind in our processing," Overland said. "Instead we were one day behind. The money saved in float more than paid for the Vips package," he said.

Overland said his disaster recovery agreement with Citizens also allows that bank to use his IBM 3890 on an emergency basis.

This form of mutual assistance — one bank helping another in a crisis — started in May 1980, when a group of banks in the Washington, D.C., area formed a nonprofit organization called Bancon, Inc. to provide disaster recovery services for its members [CW, Aug. 9, 1982]. One of its first acts was to contract with Vips to develop the software that became known as SCS.

Currently 10 member banks

Bancon now has 10 member banks in the District of Columbia and nearby Maryland and Virginia counties, and four other area banks have submitted applications to join, according to one of Bancon's directors, Michael R. Longo, vice-president and data center manager at the National Bank of Washington.

"Our basic objective is to provide contingency planning for check processing . . . which is the one data processing function that is unique to banks," Longo said.

"We agreed in principle to help each other in a disaster, no matter how small or large," he continued.

Given the increasing competition in the banking industry, Longo said, he is "amazed" at the cooperative spirit among Bancon members.

"I don't know what's going to happen when we have full deregulation and the competition gets keener, but right now it is a very cooperative attitude that all of us share," Longo said.

remote public data bases.

The link to the mainframe lets executives tap into summary operational and financial data, while the VAX link provides users with messaging capabilities and access to other administrative functions, Hardwick explained.

Housed in special cabinets

The micros are housed in special cabinets that also contain printers. They offer a consistent set of commands, menus and interfaces, regardless of which host is being tapped, according to Hardwick.

Through the executive information system, Reynolds' key players can quickly review the latest news and detailed information on what Hardwick labeled "peer" companies from remote data bases, summary financial forecasts, unit volume and market share data, "subunit-level" data and specially tailored reports, Hardwick said.

Strategic statistics, such as operating performance vs. forecast, are also available through simple commands. Each of the executives receives one-on-one instruction and works with Hardwick's staff to modify the executive information system to their own needs.

On-line fact book

For example, developers put a special "fact book" containing vital information on-line for Reynolds' president, as well as a variety of financial modeling capabilities for the treasurer.

That type of tailoring, which Hardwick said represented about 80% of the development life cycle, is an ongoing process.

In addition, executives enjoy private hot line support when problems arise.

Most of the data that Reynolds' executives access is maintained in Thorn EMI Computer Software's FCS-EPS decision support system, which the company had in place for several years before the executive information system was conceived.

Data is not simply "dumped" into the executive information system data base, Hardwick said.

Rather it is carefully reviewed and then validated by managers responsible for its accuracy, Hardwick explained.

Depending on its nature, data is updated weekly, daily or throughout the day.

"We provide them with blessed data, not just information that has been randomly grabbed from throughout the company," Hardwick said.

'Someone to beat on'

"The executives need someone to beat on if the data is wrong. They need someone to take responsibility for its accuracy."

What was the biggest obstacle to the development of the executive information system? Tying together the very different worlds of data processing, office automation and personal computing, Hardwick said.

Although he would not divulge the total cost of the development project, Hardwick said each workstation cost approximately $9,000.

How can he tell the project was a success? According to Hardwick, "They use what they asked for."

What looks like a neighborhood, acts like a hotel, and feels just like home?

Answer:

The Residence Inn, of course. For no other place combines so many of the comforts of home with so many of the amenities of a fine hotel, so affordably. In a one-bedroom studio suite, or a two-bedroom, two-story penthouse suite. For a more detailed answer, or reservations, call 1-800-331-3131.

RESIDENCE INN

As close to home as we can make it.

WAGON

from page 43

emerged at McCormack & Dodge's recent World '85 users conference in Boston. On the one hand, M&D President Frank Dodge said he wants his 16-year-old organization to be the No. 1 software company.

On the other hand, M&D's staff — heavily weighted with accountants — currently seems geared toward producing the highest quality financial applications. Dodge called M&D's new accounts receivable package "the best product the company ever produced."

Maybe company presidents are being required by marketing representatives to say they want their companies to be No. 1. Everyone is saying it. But M&D's strategy requires that the DBMS vendors remain healthy themselves.

The experience of Management Science America, Inc. (MSA) may have relevance for M&D. The former No. 1 independent software company has slipped from that position and now touts itself as the No. 1 applications vendor. Could that have happened because MSA has no DBMS?

Users are looking for a total solution; at least, that's what the vendors say. If that is true, can an applications-only company expect to remain one of the world's largest software companies? Some say the day will come when a few megacompanies will meet most of the world's software needs. If so, won't the companies with their own DBMS and a variety of applications software be best positioned to thrive?

Companies like ADR are in a slightly different predicament. ADR has a successful independent DBMS in Datacom/DB but markets few applications. This lack of product line diversity may hurt ADR in competition with a company like Cullinet.

Although 1985 has been a slow year in the DP industry, the mood was upbeat at the M&D user meeting. Dodge said he is glad M&D is privately held, because his time is not taken up talking to Wall Street analysts.

"I don't have to worry about the price of stock," he said. And he wished John Landry, former vice-president of research and development, and Robert Weiler, former senior vice-president of marketing, well in their new venture at a smaller software company.

As long as users find it cost-effective to buy M&D applications to work with another vendor's DBMS, the mood should remain upbeat.

MICROCOMPUTERS

Info centers changing vendor policies

By John Gallant
CW Staff

NASHVILLE — Major changes in the way microcomputer software vendors license and support their products are on the horizon. But only those companies that have implemented personal computing standards and centralized acquisition and service through an information center will have the clout needed to take advantage of those changes.

That was the message Dennis Lunsford offered to attendees at the recent Information Center Conference & Exposition here. Lunsford is chief of the National Security Agency's (NSA) Personal Computing Information Center (PCIC) headquartered at Ft. George G. Meade in Maryland. With fewer than 20 staff members, Lunsford's PCIC is the focal point for all micro hardware and software evaluation, acquisition and support for the far-flung offices of the NSA.

For security reasons, Lunsford said, he could not divulge the number of users, machines or remote locations supported, but the PCIC is responsible for a geographically scattered population of personal computers numbering in the thousands.

Lunsford described the PCIC as a second-generation information center, one that provides no mainframe support but controls all microcomputer operations within the massive government agency. The PCIC maintains an inventory of nearly 70 standard software products and represents users on agency procurement boards.

Vendors forced to rethink policies

According to Lunsford, the emergence of powerful information centers, which draft and enforce personal computing policies in large companies, is forcing micro software vendors to rethink their policies on licensing and support.

"The large buyer is a new factor in the industry," he said. "The large buyer is the software market now, and we need a new architecture. There are a lot of practices in this industry that are based on one-copy sales. The major companies have to change their views. Large buyers and new technologies like local-area networks and software downloading are challenging current licensing and support arrangements."

But Lunsford cautioned that information center managers will not be able to take advantage of upcoming opportunities unless they have established standards and are controlling acquisition and user support.

"You need to establish a positive, long-term relationship with a vendor, become a key customer," Lunsford said. "But all of that is absolutely tied to the fact that you must have standardized products and have centralized service, support and acquisition. Only in that way can you maximize

Lively discussions highlight AI meet

The International Joint Conference on Artificial Intelligence (IJCAI), held two weeks ago at the University of California at Los Angeles, was a cut above most computer meetings. The location was pleasant, the technology was full of intriguing twists, and the AI developers allowed to roam freely in public seemed to be cheerful types. Some quotes from AI gurus and others:

- "AI is a weak technology," said Beau Sheil, manager of product marketing at Xerox Artificial Intelligence Systems. "It works best with a lot of information that can be manipulated at a shallow level.

Mac business products bow

Macworld exhibitors target corporate mart

By Edward Warner
CW Staff

BOSTON — Though few members of the three-piece-suit set attended Macworld, a show of products for the Apple Computer, Inc. Macintosh here last month, those who did found several new products directed specifically at business users' needs. Among those products were the following:

- A 20M-byte hard-disk storage unit. Introduced by General Computer Co., the Hyperdrive 20 is said to be the first internal hard disk of such capacity for the Macintosh.
- Business Filevision from Telos Software Products, a program for filing graphics with text. This product, a business users' version of Telos' Filevision, reportedly can create larger files than Filevision and import digitized clip-art and Ascii files from other programs.
- Sidekick, from Borland International, Inc., a desktop manager program long available in the IBM Personal Computer world.
- Tempo, a program for creating macros for such Macintosh software as Lotus Development Corp.'s Jazz. Jazz and many other Macintosh programs do not support macros, the strings of commands that a program such as Tempo can memorize and make available at the touch of a key.
- Colormate, a hardware and software package for color printing of Macintosh output. This NEC Information Systems, Inc. product is being sold for use exclusively with the NEC Color Pinwriter printer.

Most notable among the new offerings for business, though, is the $2,795 Hyperdrive 20. While internal storage units of such capacity have been available for some time for IBM Personal

WHO IS THE WORLD LEADER IN IBM/38-36 BACKLOG REDUCTION?

FUSION

The world's most successful companies have made Fusion Products International the leading supplier of query/report-processor, PC interface and spreadsheet software for the IBM System/34/36/38.

Why is Fusion number 1, worldwide? Because we fully support the PC. Because we're one of the few S/38-36 vendors who actually answer their customer-service telephones. Because we offer on-site training. Because *easy-to-use* means never having to read your manual. Because selected Fusion products are available in many languages. Even Japanese.

That's why the leading software company in Japan selected Fusion as their *only* S/38-36 report processor. The *best and brightest*, everywhere, choose to spend their valuable time on business issues, not on computer issues.

You probably know our name. Isn't it time you made a most important phone call? Isn't it time you used Fusion power to obliterate your backlog?

FUSION

Fusion Products International 900 Larkspur L.C. Suite 295 Larkspur, California 94939 Telephone 415-461-4760 Telex 176089. Also in New York and Newport Beach.

Knowledgeman gets version with menu-driven interface

By Charles Babcock
CW New York Bureau

NEW YORK — A menu system and a natural-language query facility have been added to the Knowledgeman software package to produce Knowledgeman/2, Micro Data Base Systems, Inc. (MDBS) announced last month.

The package offers a number of additional options, including K-Comm for remote, asynchronous communications; K-Report for custom report generating; K-Text for text processing; and K-Paint for forms management. All the options work with a relational data base manager that was part of the original Knowledgeman issued in 1983, said Gary Koehler, president and chief executive.

Knowledgeman/2, to be shipped this week, will retail for $595. Existing Knowledgeman users can receive the updated version for $295, Koehler said.

Prices for multiuser versions

Multiuser versions are also available for $1,795 for up to 10 users on a local-area network and $3,325 for up to 32 users. Knowledgeman/2 works with Novell, Inc. Netware nets, 3Com Corp.'s Ethershare nets and IBM's PC Network. Knowledgeman/2 also works on systems running under AT&T Unix, PC-DOS, MS-DOS, CP/M-86 and up to Digital Equipment Corp. VAX systems.

The menu system is meant to overcome a criticism of the original Knowledgeman that it was difficult for a novice computer user to use, company officials said. Knowledgeman/2 will offer a user 400 pages of Help screens with menus offering selections into environment setup, computation, data management, spreadsheet, graphics, text processing and a gateway to the operating system.

After proceeding through a sequence of menu choices, users will have specified a command, which appears on the screen to teach the user the command language and to provide a shortcut to where they wish to go, the vendor said.

The natural-language query system, dubbed K-Chat, uses simple English words to query the system. Ambiguous queries can be clarified through an English conversation sequence. K-Chat has a vocabulary of 500 words and the ability to incorporate new words and phrases defined by the user, company officials said.

The spreadsheet component can extract data from independent records, spreadsheets, reports or data base tables and can use up to 65,525 cells per table, company officials said.

Prize of $800,000

MDBS is attempting to compete with other micro data base management systems vendors by offering an $800,000 prize to the user who submits the best 500-word essay on the reason for switching to Knowledgeman/2 from a competing product.

The entries will be judged on the basis of their "accuracy and originality," said Stephen Recobs, MDBS executive vice-president. The company did not indicate who would judge the essays.

MDBS can be reached through P.O. Box 248, Lafayette, Ind. 47902.

DRI to offer Summamouse with GEM line

FAIRFIELD, Conn. — Digital Research, Inc. (DRI) will offer the Summagraphics Corp. Summamouse as an option in specially priced packages of its GEM Collection software line under an agreement announced by the two vendors.

Summagraphics, located here, said the venture marked its first product offering for micros. DRI's GEM Collection runs on the IBM Personal Computer and compatible machines. It includes GEM Desktop, said to permit the user to manipulate files and operating system commands using a mouse interface, as well as GEM Paint, a 16-color electronic paintbrush program and GEM Write, a word processor.

The Summagraphics Summasketch electronic drawing tablet, meanwhile, will be offered as an option by DRI in specially priced versions of its GEM Draw package, which includes GEM Desktop and GEM Paint, Summagraphics said.

With the Summamouse, the GEM Collection costs $295. GEM Draw with the Summasketch option costs $649.

Summagraphics is located at 777 State St. Extention, Fairfield, Conn. 06430. DRI is located at 60 Garden Court, Monterey, Calif. 93942.

"Oh, he's in a really good mood today — someone asked him for a raise and he's been laughing ever since."

If You Go To Only One Business Computer Show

Make It The INFO Show

For 12 years, the industry's most successful business computer show…featuring IBM, AT&T, DEC, HP, Cullinet, Ashton-Tate, Lotus, and many other major exhibitors of computer products and services…from mainframes to pc's, hardware, software, peripherals, and data communication equipment. The renowned INFO Conference presents industry experts speaking out on timely issues. And the INFO/Software Locator Service provided by ICP Inc., will direct you to the answers to your software needs.

If You're in a Business That Uses Computers, Don't Miss The INFO Show.

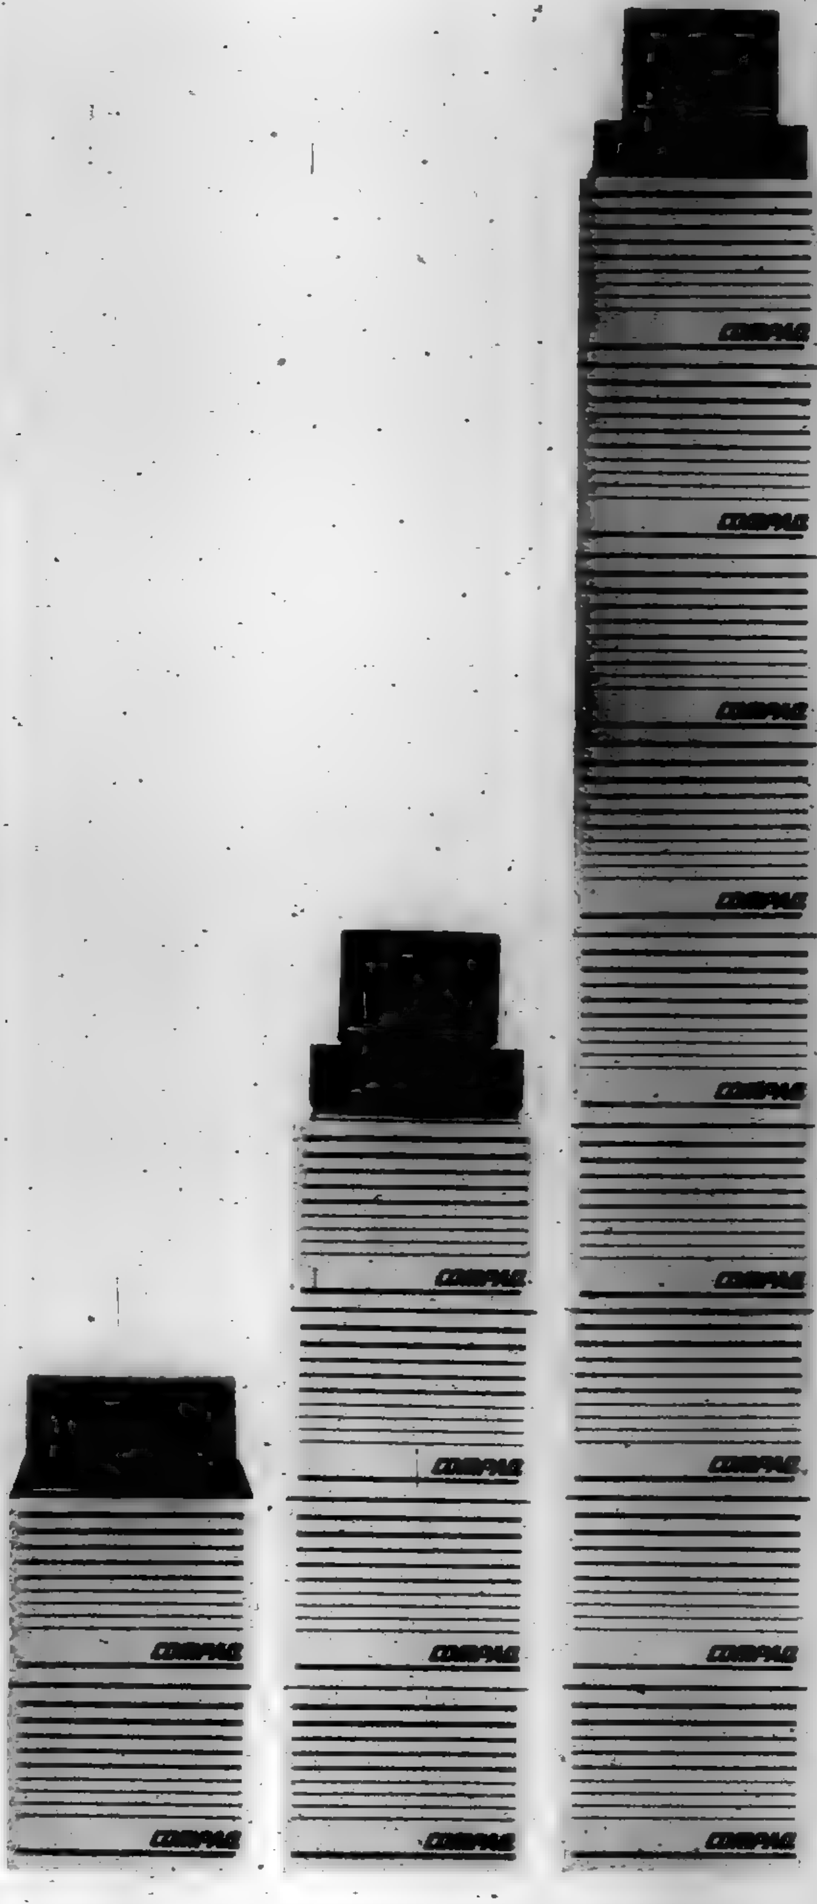
It's not that COMPAQ is the fastest growing computer company in the world...



It's why.

In 1983, COMPAQ® Computer Corporation had the most successful first year in the history of American business. Last year, our sales grew over 196%, making COMPAQ the world's fastest growing computer company.* And this year we're setting more records.

The reason is simple. Our computers simply work better.

For example: Most manufacturers mount disk drives in a rigid manner that could destroy data if the computer is bumped, but COMPAQ protects all disk drives (and their data) with shock mounts. Not just in our portables, but in our desktops, too.

We probably don't have to go to these lengths. But we do. In every detail.

Our exclusive internal tape backup system can protect Megabytes of data in minutes instead of hours.

Our computers can run the world's largest library of business software.

And now our two newest products, the COMPAQ PORTABLE 286™ and COMPAQ DESKPRO 286,™ offer more speed, more storage, and more memory than ever.

Our refusal to compromise is why COMPAQ computers are rated so highly by industry trade publications and over 300,000 satisfied users.

Visit an Authorized COMPAQ Dealer near you and you'll see what has become apparent to buyers all over the world: COMPAQ computers simply work better.

For a free brochure or the location of your nearest Authorized Dealer, call toll-free 1-800-231-0900 (in Canada 416-449-8741) and ask for operator 8.

It simply works better.

Directory evaluates micro wares

CANTON, Mass. — Corporate Software, Inc. has introduced "The Corporate Software Guide," a directory of 360 personal computer software and hardware products from 125 vendors.

The guide reportedly contains in-depth evaluations and comparisons of the products, which are divided into 18 categories. Each product category includes an overview of the products and likely applications in that category.

The 300-page guide costs $19.95, plus $5 for shipping. It is free to personal computer hardware or software buyers in Fortune 1,000 companies who request the guide in a letter written on company stationery. Orders and requests should be sent to Corporate Software, 770 Dedham St., Canton, Mass. 02021.

SOFTWARE

■ STSC, Inc. has announced that its APL Plus PC System, an applications development system, now supports IBM's high-resolution Enhanced Graphics Adapter (EGA) and Enhanced Color Display Monitor.

The EGA provides 16-color, 640- by 350-pixel bit-mapped graphics for the IBM Personal Computer and compatible color or monochrome displays. The APL Plus PC System fully supports all modes of resolution on the EGA, the vendor said.

The product implements the APL programming language and includes a full screen editor for programs and data, report formatting, filing and high-resolution color graphics.

The APL Plus PC System sells for $595.

STSC, 2115 E. Jefferson St., Rockville, Md. 20852.

COMMUNICATIONS

■ Emerald Technology Group, Inc. has enhanced its program that supports file transfer between the IBM Personal Computer line and IBM System/34, 36 or 38.

Enhancements to the Emulator Transfer Utility reportedly include local emulation support with packages such as IBM's 5250 emulation kit and Ideassociates, Inc.'s Ideacomm 5251 and print spooling capability.

The product now supports copy library members, such as procedure and source li-

Decision modeling software out for Macintosh

BOSTON — Softstyle, Inc. has introduced its Decisionmap decision modeling software for Apple Computer, Inc.'s Macintosh. The unveiling came last month here at the Macworld conference.

The $145 Decisionmap reportedly permits users to experiment with different weightings of decision factors and various rankings of alternative decisions in the manner of a spreadsheet. Unlike a spreadsheet, however, Decisionmap is said to work with qualitative data.

Decisionmap users reportedly can produce a diagram or map of the factors involved in a decision and adjust the weighting of those factors at any level.

Decisionmap users begin by entering the key factors in a decision. Up to five factors can be entered at any level, and the factors can be broken down into any number of subfactors. A tree-like map results, with a main trunk representing the decision and the various factors and subfactors represented as arms of the tree.

The various factors are then weighted, and a bar chart can be produced to compare how each alternative stacks up. If the weighting or ranking is changed, a "what-if" analysis can be done on the alternatives.

Softstyle is located in Suite 205 of the Hawaii Kai Office Building, 7192 Kalanianaole Highway, Hawaii 96825.

Continued from page 52

braries between the micro and the larger system, Emerald said. Data formats such as Ascii fixed, Ascii variable and Ascii text can be mapped to larger system formats and vice versa.

The package costs $400 for a System/34, $500 for a System/36 and $800 for a System/38.

Emerald Technology Group, Suite 102, 1601 116th Ave. N.E., Bellevue, Wash. 98004.

■ **Softronics, Inc. has announced an enhanced version of its Softerm PC communications and terminal emulation software for the IBM Personal Computer, Personal Computer XT and AT.**

Softerm PC Version 1.02 reportedly includes a built-in text editor, logon security and access restrictions, new commands for use in automatic batch command files and a terminal emulation hotkey that provides access to communications and terminal emulation while using other programs.

The software reportedly emulates more than 30 terminals, including the IBM 3101 Model 10 and 3101 Model 20; Digital Equipment Corp. VT52, VT102 and VT220; Hewlett-Packard Co. 2622A; and Honeywell, Inc. VIP7250, VIP7801 and VIP7803.

The program requires 128K bytes of memory.

The price of Softerm PC Version 1.02 is $195. Upgrade cost for current users is $25.

Softronics, Suite 10, 3639 New Getwell Road, Memphis, Tenn. 38118.

■ **Persoft, Inc. has enhanced Smarterm 400 3.1, a file transfer program operating between IBM Personal Computers and Data General Corp. minicomputers and superminicomputers.**

The enhancements are said to consist of compressed display mode support for terminals with 132-col. video interface boards, the ability to switch between a communications session and an IBM PC-DOS session and additional function key support.

Smarterm 400 supports advanced functions of DG D100, D200 and D400 terminals including multiple display windows, full character display attributes, line drawing, word processing character sets and local printer support.

Smarterm 400 3.1 costs $149. Existing customers can upgrade their packages for $40.

Persoft, 2740 Ski Lane, Madison, Wis. 53713.

■ **4D Software, Inc. has announced a package that permits IBM Personal Computers to emulate NCR Corp. terminals.**

Connection/7900 enables an IBM Personal Computer to mimic the NCR 7900 Model 3 and NCR 796-301 terminals. The package features page and message mode transmission, full status line support, Level 2 diagnostic capabilities, the ability to work with a numeric keypad, cursor control and function key support.

Users reportedly can capture screens of data to perform file or screen transfers.

The software requires 256K bytes of random-access memory and IBM's PC-DOS operating system.

Connection/7900 costs $195.

4D Software, 8759 N.W. 57th St., Tamarac, Fla. 33321.

■ **Atlantic Research Corp. has introduced its Xpert PC Card, an option board for the IBM Personal Computer that reportedly permits users to connect with up to four hosts at a time via an X.25 packet-switched net.**

The Xpert PC Card reportedly provides the Personal Computer with two ports for Ascii devices and permits Personal Computers to share X.25 lines. It emulates the IBM 3270, Digital Equipment Corp. VT100 and other Ascii devices while attached to the X.25 network.

It is priced at $1,795.

Atlantic Research, 5390 Cherokee Ave., Alexandria, Va. 22312.

APPLE

from page 49

Computers, most disks for the Macintosh held a maximum of 10M bytes, including General Computer's original Hyperdrive offering.

Like the Hyperdrive, installation of the Hyperdrive 20 by an authorized General Computer dealer will not void the Macintosh warranty, according to General Computer.

Hyperdrive 20 also reportedly comes with software for partitioning of the disk into 32 file drawers — each with a separate icon on the screen — and for scrambling of the contents of the files, the latter being a file security system.

Print spooling software is also included to permit the Macintosh to be put to other uses while output is printing.

Hyperdrive 20 costs $2,795 and will be available in early October. Hyperdrive users will be able to upgrade to 20M bytes of storage for $895 after Dec. 6.

The $395 Business Filevision reportedly offers other features that exceed the capabilities of Filevision itself, including a drawing area that is 8 in. by 10 in. rather than only the size of the Macintosh screen.

Users are able to move the drawing area about on their screens to get full access to it.

Another Business Filevision enhancement is the ability to work with files as large as 4M bytes and to exchange Ascii, Data Interchange Format and Sylk files with programs using those file formats. Business Filevision will be available in November and requires a 512K-byte Macintosh.

Borland's version of Sidekick for the Macintosh reportedly offers several enhancements over Borland's version for IBM Personal Computers, including a limited form of concurrency under which users reportedly can print or telecommunicate in the background while using such Sidekick features as its notepad in the foreground.

Another advantage of Sidekick in its Macintosh version is its telecommunications capability. Reportedly available are such functions as a phone log for incoming and outgoing call logging and instant area code lookup.

The communications function is said to be compatible with Hayes Microcomputer Products, Inc. offerings and to support file transfer at 300, 1,200 or 2,400 bit/sec. using either the computer's modem or printer port.

Standard Sidekick features such as an on-screen calculator and a daily appointment calendar are reportedly also included.

Affinity Microsystems Ltd.'s Tempo permits users to edit a macro so that it will pause for data entry while it executes.

Macros created by Tempo can also branch on a logical command or transfer information between unrelated programs.

The program works with nearly all software for the Macintosh, Affinity said.

Colormate is said to make color printing available for Macintosh users for the first time. It permits up to eight colors to be used in printing text or graphics from such applications as Apple's Macdraw and Macproject and Microsoft Corp.'s Microsoft Word and Microsoft Chart.

It also supports one-color printing. Colormate is $125 and can be purchased with the NEC CP2-6 and CP3-6 Color Pinwriter dot matrix printers for $1,210 and $1,610, respectively.

General Computer is located at 215 First St., Cambridge, Mass. 02141.

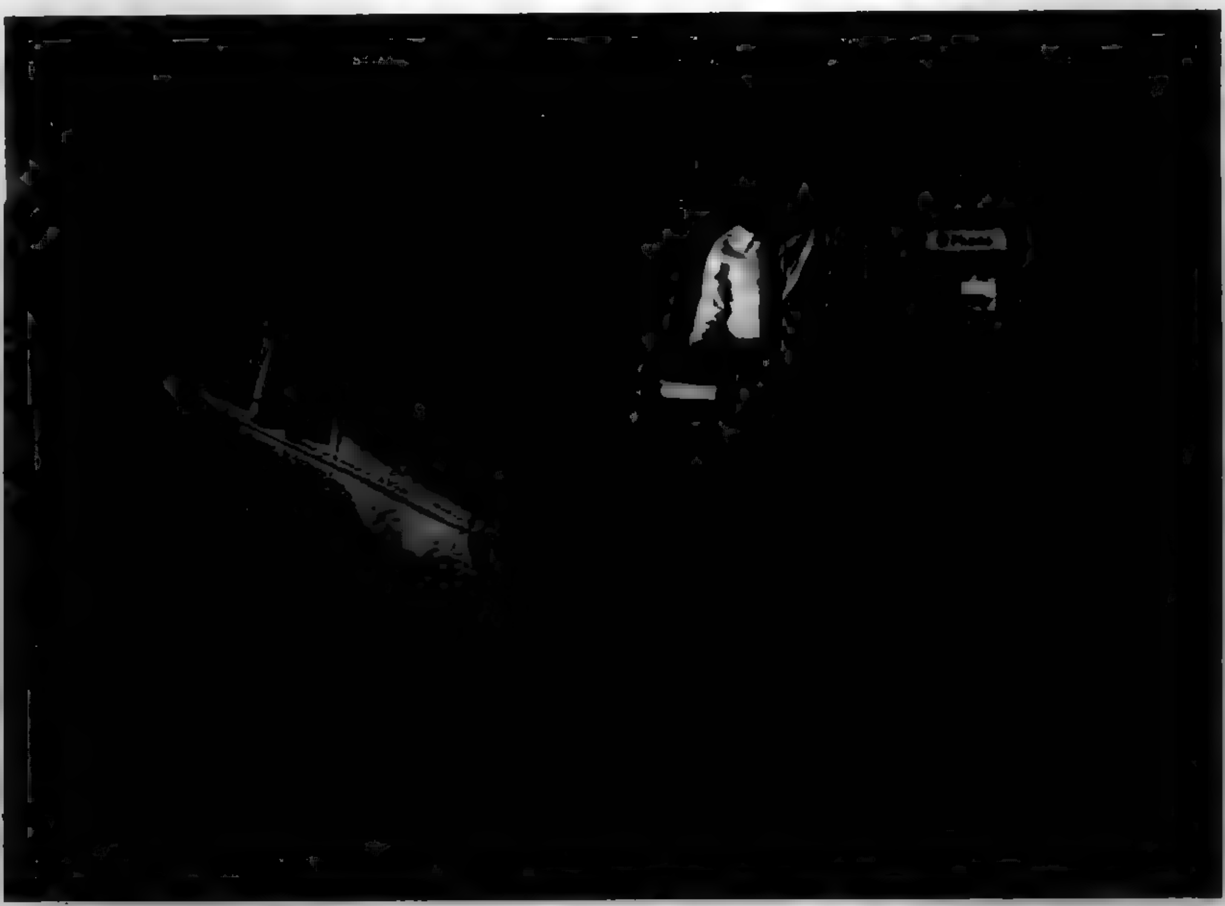
Telos Software Products is located at 3420 Ocean Park Blvd., Santa Monica, Calif. 90405.

Borland International is located at 4585 Scotts Valley Drive, Scotts Valley, Calif. 95066.

Affinity Microsystems is located at 745 LaFarge Ave., Louisville, Colo. 80027.

NEC Information Systems is located at 1414 Massachusetts Ave., Boxboro, Mass. 01719.

"This one is very friendly. It's equipped with a laugh track for your mistakes."



TI announces the portable sales tool for General Electric Plastics' field communications.

Instant access with their technical data base and 24-hour communications with headquarters. That's what the SILENT 700™ Model 707 with its easy access module means to GE Company's Plastics Sales Division. Regardless of time zones and sheer distance from the home office, GE Senior Sales Representative Ray Forester can get the latest product data and cost analysis information he needs to prepare for and close a sale. All he needs is his TI 707 portable data terminal and a telephone.

"With the terminal, I can tap into GE Plastics' data base. When ERIS (Engineering Resins Information System) is accessed by my TI 707, I can provide a customer with technical information and product specifications on the spot and leave him with a printout to review.

"The terminal also acts as my message center when I'm in the field. I transfer messages through the GE Crossfile (electronic mail), and the individuals receive them in written format when they pick up their messages. They seem to respond more promptly with accurate, hard copy in front of them. And since I can receive messages anytime, anywhere, the TI 707 all but eliminates 'telephone tag.'"

Ray Forester believes that the TI 707 is ideal for the salesman on the go. It's lightweight and rugged, takes up approximately one half of a briefcase, and is quiet even at peak operation. "It's exactly the productivity tool we needed for our division's field communications," he concluded.

Find out about the Model 707 SILENT 700 Portable Data Terminal from TI and how it can solve your communications problems. Call 1-800-527-3500, ext. 709; in Canada, 416-884-9181. For more information write TI, P.O. Box 809063, Dept. DTB 1930W, Dallas, Texas 75380-9063.

The office of the future arrives in October by mail.

Few things are changing as fast as the office work place. What with things like word processing and electronic mail and telecommunications, it's tough keeping up with what's available today. Let alone what's coming tomorrow.

But that's exactly what we're going to do in our October 16th Office Automation issue of *Computerworld Focus*. And that gives you an ideal forum to sell just about any computer-related office product you have. Because you can surround your advertising with hot, relevant editorial.

We'll start by taking a look at the needs of the end user. And how today's technologies and MIS/DP departments are—or aren't—handling the problems.

Then we'll discuss today's trends and where they seem to be taking us. Trends like top-to-bottom computer architectures. Standardized communications protocols and operating systems. Integrated software. Fiber optics. Cellular radios and phones. Just about every new twist for the office of the future.

So if you've got a product or service that belongs in the automated office, it also belongs here. The **October 16th** issue of *Computerworld Focus*. But hurry, closing is **September 6th** (materials due one week later).

For more information, contact Ed Marecki, Vice President/Sales, *Computerworld Focus*, 375 Cochituate Rd., Framingham, MA 01701 at (617) 879-0700. Or call your local sales office.

COMPUTERWORLD FOCUS

AI from page 49

"What you see on the show floor is very technically sophisticated and very demanding, but commercial customers want stability," he pointed out. Developers and customers are split into two camps: "One group wants to rush out with all this steaming software, and the other says, '3-year-old software is just fine.' "

Most of the demand for AI-based technology comes from someone outside of information systems management trying to solve a problem, Sheil noted. "The technical community tends to be conservative," he said, but sooner or later it will have to make peace with the early adapters to artificial intelligence.

Some firms that support AI research groups "have no intention to pay attention to what the groups will do," he added, mentioning IBM in particular.

■ Sheil's boss, General Manager Alan Moskovitz, said Xerox has received an order for 1,000 of its new 1185 workstations. These will end up "on the desks of professionals providing end-user services to consumers." Xerox is "flooded with requests" for other purchases at that volume, he claimed.

■ "AI is different than it was 20 years ago," said Alan Kay, an Apple Computer, Inc. Apple Fellow. "First, people are making money on it." Quoting Henry David Thoreau's advice to "beware of all enterprises that require new clothes," he drew laughter and applause from hundreds of listeners in the crowded ballroom.

"Instead of doing problem solving, we need to do problem finding, and I think that's where AI has really fallen down in the past few years," he remarked.

Kay also pointed to limitations in logic-based programming ("logic is a very, very weak way to go about solving problems") and parallel processing ("if the [Intel Corp. 80286] is a computer with a terrible architecture, what is it when you have 16 of them?").

■ Verbally, at least, we're seeing "intelligence inflation," joked Ronald Brachman, an AT&T Bell Laboratories researcher. "We had intelligent terminals 15 years ago, so what do we have now? Hyperintelligence?"

Brachman also stated that "the things we know as expert systems are very fragile." An expert system's performance falls off drastically at its outer bounds, and "it's almost impossible to characterize what those bounds are," he said.

Additionally, those using an expert system may have no idea of its limitations. "Expert systems that do diagnosis usually don't know that people have two arms and two legs," he said.

■ Hector Levesque of the University of Toronto neatly summed up a similar point: "You certainly wouldn't want an expert system to control the landing of jumbo jets."

■ "This technology is really immature," said Larry Geisel, president of Carnegie Group, Inc. "We've been in it for seven years, and we know how little we know." He described most of the artificial intelligence products on display as "absolute toys" and said that "AI solutions don't scale up."

A revolutionary idea takes the next logical step.

Before the Dark Ages went completely dark, man invented the wheel. Took everybody by surprise, too. So did STEAMER.

Not long ago, STEAMER revolutionized the data communications industry. And now, it's doing it again. Because now STEAMER has synchronous support.

Finally, you can handle synchronous data.

Now STEAMER gives you long awaited synchronous support. It can handle both synchronous and asynchronous data lines and reduce your line costs. All while improving your operating efficiency.

And it can do it for as little as $3500 per end for a 4 channel unit.

Our data compression is the best you can get.

STEAMER gets data compression efficiencies higher than anyone else, averaging 2.2:1 to 3.2:1. Which means increased throughput and operating efficiency for you.

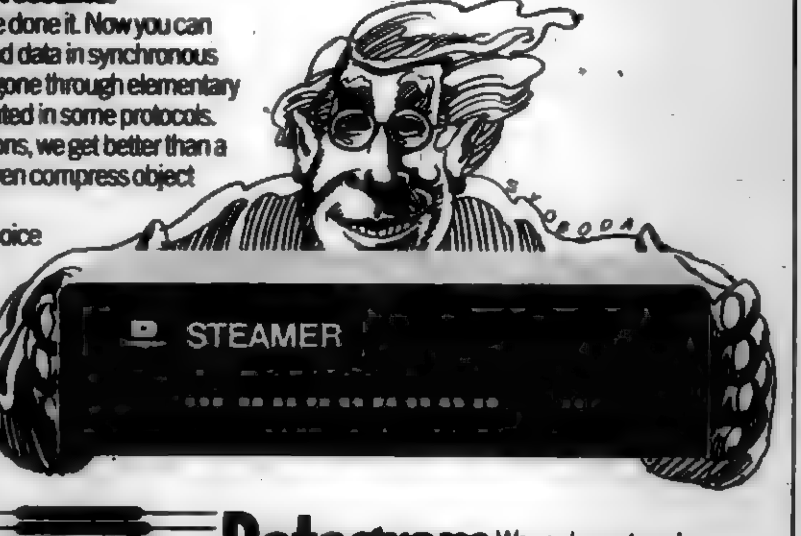
Put to good use, the wheel improved operating efficiency and made the impossible possible. Just like STEAMER with synchronous support.

Proprietary compression algorithm: the heart of the matter.

Our proprietary compression algorithm continually analyzes the incoming data stream on a port-by-port basis and compresses the most frequent strings into shorter strings. STEAMER also analyzes the data in each direction on a port-by-port basis and builds entirely independent compression tables. That ensures that you get maximum compression efficiency.

We compress the uncompressible.

We are the only ones who have done it. Now you can compress previously compressed data in synchronous applications. Even output that's gone through elementary compression routines implemented in some protocols. Plus, in some graphics applications, we get better than a 2:1 compression ratio. We can even compress object code files.



STEAMER is really the only choice for passing synchronous and asynchronous data for data communications. Call 1-800-235-5030 now and we'll tell you more about STEAMER. Because pretty soon, STEAMER will make all other stat muxes and data compression machines obsolete.

Datagram We make networks work harder.

CHANGE from page 49

your leverage."

Because the PCIC has taken responsibility for all software acquisition, Lunsford said, it recently purchased 600 units of a popular micro software package, which retailed for $650, for only $122 a copy — even though the federal General Services Administration had worked out a "best price" of $470 with the vendor.

"Bulk acquisition opens up a new door — a most important door for information centers. Don't leave acquisition to users, vendors or attorneys. Take the lead," he said. "Because we have standardized, we can predict demand and buy in bulk."

Lunsford said the information center manager can work with vendors to overcome some nagging issues. Those issues involve the handling of warranties, distribution of backup diskettes and updates or fixes, and authorized copying of software.

"You should not have to fill out 500 warranty cards when you buy 500 packages," he said. "Also, the vendor cannot tell you the software can't be moved. You can't agree to run it on only one machine. In addition, you should not have to distribute 500 backups after you have already installed the originals. The original and backup should come in one package. The vendor will meet your needs in these areas, but only if you communicate them."

Special support consideration

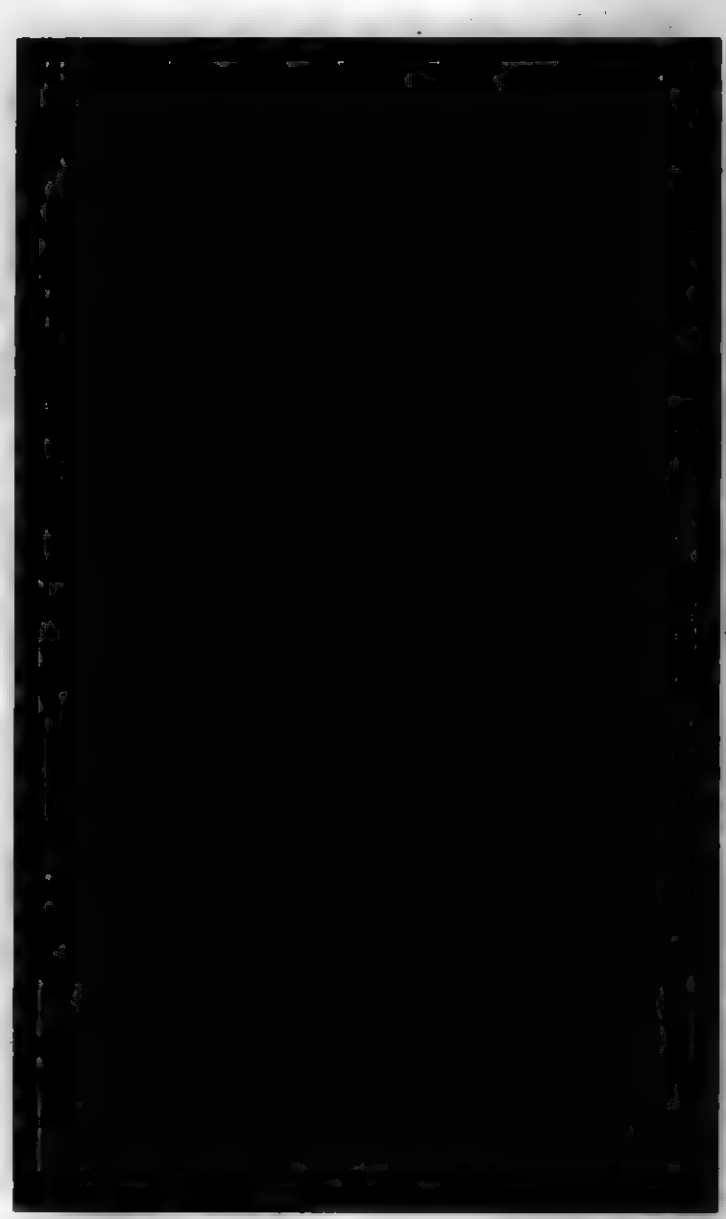
By handling the majority of user problems with software — reducing the vendor's work load — the information center should also get special support consideration. "You are stopping 99% of user calls. But when you have to make that one hot line call to the vendor, you get put on hold for an hour. Vendors should serve you better. They should set up a special information-center-oriented hot line. You can only arrange that kind of relationship contractually and only if you request it."

Lunsford said information center managers must also communicate to vendors their concerns about so-called lock-and-key protection schemes and shrink-wrap licenses, both of which pose problems for large organizations.

"Vendors are looking to keys, and information centers can't deal with that. It can't be managed. Shrink-wrap laws are also a problem because a national organization could face as many as 50 different laws."

Straight talk about application software packages.

"Most application software packages are functionally rich. The problem is, that's simply not enough."



While everyone agrees that packaged applications possess great potential to save time and money, you'll hear a lot of people—from MIS directors to operations managers—tell you the ones their companies have implemented fall somewhere short of satisfactory.

Typical limitations include the fact that the packages require such extensive modification that the savings they seemed to offer totally disappear. Another common complaint is that one application package fails to integrate with another. A third shortcoming, and perhaps the most common, is that packaged applications cannot be easily adapted to reflect the changing nature of the business.

You have only to look at the architecture of most of the applications currently in use to understand why these problems exist.

Many companies today depend on applications designed with technology from the 60's and 70's. Some are 2nd generation applications built without any reliance on database architecture. Others are 3rd generation applications that provide only a generalized *interface* to a database management system; in addition, many application vendors provide a common front end user interface to mask inefficient architecture. The result is that these 3rd generation applications realize only about 10% of the power of a DBMS. *And that's simply not enough.*

Without full use of the facilities of a superior DBMS, users of application software find it extremely difficult to adapt and extend an application package to their current as well as to their future business needs. And *only* when an application is built with advanced database technology can it provide the sharing of data that leads to functional integration between different application modules.

Ultimately, what's required is software that goes beyond the conventional packaged applications approach.

What's required is 4th generation applications software—software that's rich in functionality, and whose underlying architecture is built on, and takes full advantage of, advanced database technology.

Fourth generation application software is created using a comprehensive application development facility combining a fourth generation language and end user query and reporting facilities with an integrated data dictionary. Furthermore, fourth generation application packages are functionally integrated, sharing common data between independent modules. This creates an environment to easily adapt and extend an application package, and provides realtime access to all information.

Only fourth generation application software packages enable a company to realize the full potential of packaged applications.

It is clear, therefore, that all application packages of the future will be built using this technology... because it doesn't make sense any other way.

J. J. Cullinane

John J. Cullinane
Chairman of the Board

The only applications worth buying are 4th generation applications.

And only Cullinet offers 4th generation applications. Simply stated, our applications are a step beyond conventional applications packages because they meet these key requirements.

1. Functional Richness

Cullinet's complete line of applications delivers leading edge functionality in all areas. Whether it's our manufacturing control system, or integrated financial reporting and cost management applications, our human resource management system, or our relationship banking system, each Cullinet application is carefully designed by knowledgeable industry professionals who have a thorough understanding of application requirements. Our integrated closed-loop, net change manufacturing, financial reporting, and cost management applications provide complete multi-plant capabilities accommodating the most demanding reporting and control requirements. Our human resource management system combines complete personnel reporting and payroll processing into a single system, and our relationship banking system provides a total customer information environment for today's business executive. You can be assured that a Cullinet solution can be put into production immediately to fulfill your most pressing business requirements.

2. Functionally Integrated

Businesses today demand applications to do more than address individual functions. Businesses today need applications that recognize the interdependencies within an organization—in short, applications that can share data. For example, efficient real-time, four-way matching of invoices with receiving, purchase and inspection documents can only be achieved through true sharing of data, and this sharing of data can only be achieved with an advanced database technology which delivers that integration. Redundancies are eliminated and productivity is increased when all applications dynamically reflect the operations of the organization. By sharing an architecture that provides for optimum use of an organization's information, Cullinet's manufacturing, financial, human resources and banking applications fulfill this need.

3. Easy to Tailor

Although many businesses appear on the surface to operate in a common fashion, each, in fact, is unique. Applications must therefore be built with an optimized set of tools that permits them to be adapted to a company's way of doing business, rather than having the company have to adapt to accommodate the software. Cullinet applications are designed to accommodate change. They provide the means to personalize screen layouts, capture new information, reformat reports, resequence transactions, and change messages without impacting the entire environment. Only Cullinet's applications can provide this environment for adaptability through their integration with advanced database technology. In this way, Cullinet applications give users the independence to adapt them—quickly and efficiently—to meet the unique requirements of the business.

4. Easy to Extend

As a business changes and grows, so do its needs and requirements. Cullinet provides easy to use, menu-driven facilities that permit functional extension of an application while preserving integration. An end user can quickly react to new requirements by prototyping an application functionally, developing new reports and performing ad hoc queries immediately. MIS can efficiently develop new, associated applications sharing common data and built utilizing the existing architecture. The Cullinet architecture segments the program logic, edit and validation criteria, as well as the security and recovery process, and therefore the complexity of creating new application functionality is significantly reduced.

5. Easy Access to Information

Access to all corporate information is key to any application. Because all pertinent data must be available to the analyst and decision maker, easy access to that data, *no matter where it resides*, is mandatory. Your need for information naturally crosses applications boundaries. The ability to associate detailed information about sales orders, finished goods status, and customer credit processing before release of shipments is a prime example. Only by means of Cullinet's applications, which are completely integrated with our Information Center Management System are you provided the opportunity to create an information center that is functionally complete, meeting the information needs of the company as a whole and meeting the specific needs of the operational units of the organization. Each center of functional activity within your organization is served by the system through your mainframe or PC with GOLDENGATE software. Each has access to all corporate information. Accessibility to all information—whether it's in your mainframe, in a departmental minicomputer system, or in your personal computer—makes it readily available to you for analysis through Cullinet's complete information environment.

Manufacturing, Financial, Human Resource, Banking

Cullinet

400 Blue Hill Drive, Westwood, MA 02090-2198/1-800-[illegible]

Our issue on Big Blue can put you in the black.

Big Blue or not Big Blue.

A decision everyone must ultimately make. And even when they choose an alternative, invariably the first question is how to connect with IBM equipment.

Our December 4th *Computerworld Extra!* will provide a number of perspectives on the situation. Which will be of critical interest to anyone dealing with IBM. And that's just about everyone.

First, we'll delve deep inside the company itself. And look at possible mergers and acquisitions, corporate structure, financial status, and the personalities involved.

Then we'll take a hard look at the company's products and strategies. We'll discuss their strengths and weaknesses. We'll look at the new hardware introductions. And explore IBM's local area networking introductions.

Finally, we'll cover the alternatives, from PCs to mainframes. And of course, the compatability issue.

And all this information will go out to our 128,000 paid subscribers. Plus the hundreds of thousands of people they pass us along to.

So if you've got a product or service that's IBM compatible — or an alternative — let IBM do your selling for you. In the December 4th *Computerworld Extra!* on IBM. But hurry, closing is October 25th.

Send in the coupon below to reserve your space today. Or call Ed Marecki, Vice President/Sales, at (617)879-0700 or your local sales representative. Call today.

☐ Please reserve space for me in the *Computerworld Extra!* on IBM.
☐ Please have a sales representative call me.
☐ Send more information on your *Computerworld Extra!* on IBM.

WIRETAP
Daniel Minoli

Defining budget terminology

SECOND IN A THREE-PART SERIES

A few years ago the processing resources of a typical corporation might have included a multimillion dollar computer and a few thousand dollars worth of communications equipment. Today that CPU complex is often augmented by a multimillion dollar communications network.

When the total expense for data communications was a few thousand dollars, the data communications manager could get away with simple and intuitive financial decisions. Now, due to the figures involved, the communications manager must become increasingly knowledgeable about financial theory.

Some basic terms needed to formulate decision models for comparing alternative strategies are defined below. These concepts, together with those defined in last week's column, will be employed next week for two specific buy/lease examples. Terms required to make such formulations include the following:

- Present value. This is the value of money at the present time, even if the money is due at some future point. Because of inflation, the opportunity to invest the money and earn interest and the uncertainty of the future, money in hand is more valuable than the promise of cash a year down the road.

For example, the present value of a pension is very small. Participants in a pension pool do not know if they will live long enough to collect, if they will quit before they are vested or if the company will go out of business before they are vested; thus money in hand today is more valuable and sure. The same concept applies to business cash flows. Hence a network enhancement that promises to return $1 million in one year is better than an alternative that promises to return $1.06 million in two years.

- Future value. This is the value of money at some future point. For example, $1 invested at a compound rate of 10% would be worth $2.59 in 10 years. However, the future purchasing power of that dollar will be the same as it is today unless the rate of interest earned exceeds the rate of inflation.

- Lease. A lease is a contract between a lessor and a lessee, whereby the lessee pays a fee for the use of a resource owned by the lessor. The fee is usually paid monthly and involves a fixed prenegotiated charge.

- Net lease. This is a lease under which the lessee pays for all maintenance and upkeep of the asset.

- Third-party lease. Also called a leveraged lease, a third-party lease is an ar-

AT&T, offshoots trim the fat

By John Dix
CW Staff

Monopolies are fat. Particularly government-regulated monopolies.

It comes as no surprise that AT&T has had to pare roughly 20% of its work force. Before divestiture, AT&T had more employees than the population of Louisville, Ky. Its revenue was roughly the size of Norway's gross national product. It had more assets than the combined top three U.S. industrial companies.

Now splintered, each of the resultant eight fragments foraging in new and often competitive markets, AT&T and the seven regional Bell holding companies have to slim down to survive.

While no one predicted it, divestiture has been hardest on AT&T. Facing dismal first-year earnings that fell far below expectations, AT&T cut 11,000 jobs in 1984. The latest round of cuts — roughly 24,000 jobs — brings this year's list of casualties close to 26,000.

The divested Bell operating companies have, conversely, fared well financially. This has stemmed the need for personnel cutbacks but not obviated the need to trim fat.

A maintenance supervisor for one divested Bell operating company recently admitted that cost control has become so stringent that employees have to sign for pens. The consciousness has spread throughout the company.

Inventories of equipment have been cut. Before divestiture the maintenance division this supervisor worked for used to keep 60 days' worth of cable and wire in its yard. That is, it would take the operating company crew 60 days to lay all the cable it had on hand at any one time. Now the company's crews keep eight and 10 days' worth of cable inventory on hand.

Management is being spread thinner. While supervisors at this employee's company once managed seven or eight people, those same individuals now oversee twice as many employees.

Truck fleets are being reassessed. This supervisor's company keeps a fleet of maintenance trucks that is 6,000 strong. Many of these trucks get only 10 miles per gallon of gasoline. New trucks the company is studying could get 17 miles per gallon.

These cost-cutting measures, coupled with sound financial results, have spared the employee cutbacks that are plaguing AT&T. But former Bell operating company personnel aren't dillydallying under the impression that job security is what it used to be. "One of the reasons people used to join the phone

Barcode Industries introduces scanner

GREAT NECK, N.Y. — Barcode Industries, Inc. has announced a bar code scanning system that supports up to 16 readers and connects them to a single RS-232C computer port.

The master MR-Net unit supports readers on a single RS-422 data communications line. The master unit can be supported on any RS-232C computer interface. The MR-Net master unit is preprogrammed to poll the slave readers, which have switch selectable addresses.

The reader units can be either light pens or hand-held laser scanners, Barcode reported. Both of the units are available with or without displays. Reader units with displays can receive and display messages from the computer. Maximum distance between the master and the last reader on the RS-422 line is approximately 3,000 feet.

MR-M master costs $720, as does the MR-3 slave equipped with a Barpen light pen without display. The MR-2 Barpen with display costs $920. Either of the former costs $1,500 more with an SP hand-held laser scanner.

The products are available immediately after the receipt of order.

Barcode is located at 17 Barstow Road, Great Neck, N.Y. 11021.

DG's intelligent controller out

WESTBORO, Mass. — Data General Corp. recently announced an interface that enables its Eclipse MV family of minicomputers to connect to Net/One broadband local-area networks produced by Ungermann-Bass, Inc.

The intelligent broadband controller is a 15-in. board that mounts internally in MV series processors. It has 256K bytes of random-access memory, a Microeclipse processor, a serial I/O section and a data channel interface. The board connects to IEEE 802.3-compatible broadband Net/One through an Ungermann-Bass broadband modem.

According to the company, the intelligent broadband controller completes a marketing agreement between the two companies that was reached in January.

Under the terms of that agreement, Ungermann-Bass sells to DG customers an array of components for use with its Net/One network, including the cable, head end and modems.

The intelligent broadband controller is available 90 days after receipt of order for $6,500.

Net/One is available from Ungermann-Bass, which is located at 2560 Mission College Blvd., Santa Clara, Calif. 95050. DG can be reached at 4400 Computer Drive, Westboro, Mass. 01581.

VOICE/DATA COMMUNICATIONS

■ **Crosby Lybus, Inc. has introduced Comcop, a personal computer software package that enables users to manage Rolm Corp.'s private branch exchanges.**

Comcop runs on the IBM Personal Computer and creates telephone extension profiles by class of service, call forwarding characteristics, pick groups and hunt groups, the vendor said.

Standard reports, which can be printed or generated on-line, include user profiles, move and change orders, problem reporting, extension profiles, organization directories and system speed. The software also provides an on-line attendant directory for use by the switchboard operator.

Comcop VS for use with Rolm CBX II's with fewer than 144 extensions is licensed for $1,500. Comcop for more than 144 extensions is priced at $5,000.

Crosby Lybus, 40 Bedford Road, Armonk, N.Y. 10504.

■ **Data Switch Corp. has announced that its switching and control products now support IBM and IBM-compatible diagnostic modems.**

The Data Switch XY-MAX Model 2840-II and Model 2810 digital matrix switches can now support the transmission signals required by IBM's diagnostic modems to perform problem isolation and correction procedures, the vendor said. No special cabling is required.

The Data Switch XY-MAX Model 2840-II costs $175,000 for support of 256 by 256 RS-232 lines. The Model 2810, which supports 64 digital and 64 analog lines, costs $49,100.

Data Switch, One Enterprise Drive, Shelton, Conn. 06484.

MULTIPLEXERS/ MODEMS

■ **Televell has announced the Dial-Up Port Expander (DPE), an analog device intended to enable a mainframe port and a synchronous modem to support five dial-in lines.**

The DPE sits between a modem and the outside dial-up lines. The product is compatible with IBM 3270 or 5251 protocols and any half-duplex, synchronous dial-up modem up to 9.6K bit/sec., according to the vendor.

Five remote cluster controllers or cluster controller emulators can dial in to the DPE simultaneously, using the 5251 or 3270 protocols, the company said.

The DPE is priced at $4,500.

Televell, Suite 104, 1901 Embarcadero Road, Palo Alto, Calif. 94303.

■ **Dataprobe, Inc. has announced an addition to its Fallbacher II family of dial backup equipment, the Fallbacher II Two-Call Dial Back-Up switch.**

The switch is now available in a high-density rack mount, allowing dial backup of up to 16 leased lines in a 5¼-in. rack space. The initiating switch card allows the transfer of a leased-line modem from the four-wire line to two dial lines.

The price for the LIS-RV model local initiating switch rack-mounted card is $315, and the LIS-R-16 model 16-position card rack costs $325.

Dataprobe, 110 W. Palisades Blvd., Palisades Park, N.J. 07650.

FAT from page 61

company was for job security," the supervisor said. "People are more apprehensive."

This apprehension is well founded. Although AT&T has a virtual monopoly on long-distance services, it faces competition on more fronts than do the divested Bell operating companies. AT&T, for example, is no longer the only game in town for an array of services.

The largest threat the divested Bell companies face, on the other hand, is bypass. Although very real and potentially crippling, bypass is not as well advanced as the competition is in AT&T's markets. Realizing this, the former Bell operating companies are trying to head that threat off at the pass by exploiting new technologies like fiber optics.

Regardless of the measures taken, it is clear that AT&T and the former Bell operating companies still face an uphill climb as they strive to shed the complacency bred from years as a government-controlled and protected monopoly.

FINANCE from page 61

rangement under which the lessor borrows funds to cover part or all of the purchase price of the asset or equipment. A third party owns the equipment. Sometimes a firm buys the equipment, sells it to the third party and then leases it back.

■ Sale and lease back. As described, sale and lease back is an arrangement under which the user of the asset sells the asset and then leases it back from the purchaser.

■ Salvage value. Also called residual value, salvage value is the price that the firm can receive for an asset after it has been used for an extended period of time.

■ Payback period. The interval required for an asset to generate enough cash flow to cover the initial outlay for that asset is its payback period. For example, an asset costing $15,000 that generates an after-tax cash flow of $5,000 has a payback period of three years.

■ Break-even point. This is the level at which inflowing cash equals the cost of the investment, namely, earning a zero profit on a given project or investment.

■ Capital gains or losses. The difference between the original cost of an asset and its selling price is a capital gain or loss. Capital gains or losses are realized only after the asset is sold.

Next week we will apply these and last week's concepts to problems confronting managers faced with the task of evaluating and acquiring data communications equipment.

SYSTEMS & PERIPHERALS

Scientific processor upgraded

BEAVERTON, Ore. — Floating Point Systems, Inc. has announced the FPS-364, a replacement to its FPS-164 scientific processor.

The FPS-364 reportedly offers the performance of the original scientific-oriented processor at a 60% weight reduction, 50% reduction in noise level and lower power requirements. The FPS-364 is compatible with all levels of FPS-164 applications software and systems software.

The FPS-364 is said to handle the scalar and vector operations typical of large Fortran programs and to relieve a general-purpose mini or mainframe computer of scientific processing tasks. The FPS-364 features high-speed, 64-bit architecture and up to 72M bytes of main memory.

The FPS-364's optimizing compiler works with Fortran 77 programs. Floating-point operations are performed using pipelined 64-bit computational units.

With peak speeds of 11 million floating-point operations per second and 15-digit precision, the FPS-364 reportedly offers high performance on structural analysis, design automation, oil reservoir simulation and computational chemistry applications.

More than 40 applications programs are available on the FPS-364, and it is compatible with IBM, Digital Equipment Corp., Apollo Computer, Inc. and Sperry Corp. environments.

The FPS-364 is priced at $298,000 with 4M bytes of memory, one FD64 controller, an 800M-byte disk drive and the SJE operating system and program development software.

Floating Point Systems is located at 3601 S.W. Murray Road, Beaverton, Ore. 97005.

Minis complement net of systems, report says

By Donna Raimondi
CW Staff

FRAMINGHAM, Mass. — Despite the growth of increasingly powerful microcomputers, minicomputers still garner their share of the departmental end-user market, according to a market research report released recently.

Methods for managing minicomputers involve staff, equipment and data concerns, according to International Data Corp. (IDC), a research firm based here that published the report titled "Minicomputer Applications in End-User Departments."

Companies increasingly are finding that a combination of mainframes, minicomputers and microcomputers help them perform all of their computing needs, the report said.

For small businesses and decentralized corporations, traditional minicomputers have a legacy of business applications that has yet to be equaled by microcomputer software, IDC noted.

Minicomputers in a department can complement a network of microcomputers by serving as a host for departmental data bases and as a gateway to corporate mainframes, according to the research memorandum prepared for IDC's Continuous Information Services Clients.

Minicomputers are small- and medium-scale computer systems, according to IDC's classification system, which lists four categories of processors — large-scale, medium-scale, small-scale and personal computers.

Medium-scale machines are typified by the Digital Equipment Corp. VAX-11 products, Data General Corp. MV products,

Secure Xerox workstation out

EL SEGUNDO, Calif. — Xerox Corp. has announced the 1108-105T artificial intelligence workstation, which meets federal standards for secure installations.

The workstation is compatible with Ethernet local-area network and joins the Xerox line of Secure Information Device print, file and communications servers, a spokesman said.

Secure Information Device accreditation was established by the National Security Agency to prevent classified information from being leaked in the form of electronic signals. The specification sets a limit on the strength of such signals emitted by equipment used for classified applications.

The workstation's 42M-byte rigid disk is transportable. The Xerox 1108-105T includes the company's Interlisp-D programming environment designed for coding AI applications. The 1108-105T with 1.5M bytes of main memory, 8M bytes of virtual memory and a 137-nsec cycle time is priced at $34,950.

Xerox also announced that the 1108 series of AI workstaions can now interface with the IBM Personal Computer, IEEE 488 and Intel Corp.'s Multibus-compatible peripherals with the Busmaster option. The Busmaster option, which includes a workstation card and software, enables workstation users to incorporate a variety

Don't count on IBM to stop the slump

HARD TALK
Tom Henkel
CW Senior Editor

The rumor mill was abuzz the week of Aug. 19. IBM was going to announce something — that seemed to be common knowledge — but what?

The list of possibilities was impressive. Some said IBM was going to unveil an array processor for the 3090 series of mainframes. Others said they believed that IBM would announce new models of its 3090 — the Models 100, 150 and 600, as they were called.

Still others said the time had come for the long-awaited IBM token-ring networking scheme to make its debut.

Aug. 19 arrived, and IBM dutifully made its announcement — two modems and a graphics printer for the Personal Computer, a series of service discounts for the Personal Computer and a nebulous statement that the Watson Research Center is interested in parallel processing. So what?

Big Blue letdown

Hopes were high that IBM would do something to brighten the doldrums of a yawner of a summer. Big Blue let us down. Let's face it, two modems and a printer are not the much-needed spark to blast the computer industry back into a prosperous orbit.

Just as fans look to superheros to rally the home team to a come-from-behind win, the computer industry seems to be depending on IBM to do something to pull the industry out of a nagging slump. But does IBM really have a responsibility to toss a life ring to hurting computer companies?

After all, IBM is probably just as much to blame for the slump as any of the other factors that have been bandied about as the cause of these dismal times.

IBM had the nerve to post two lousy quarters in a row. This was an unimpressive feat that seems to have thrown much of the rest of the computer industry into cardiac arrest.

So to make up for it, why shouldn't IBM announce a series of important, strategic products in the worst part of a "barfo" year just to get the industry back on track?

Be serious. IBM is a multinational corporation, not a pitcher for the New York Mets.

Nowhere in the Big Blue rule book is there any mention of a responsibility to serve as savior to the industry.

IBM is going to plod along doing what it has done so well for the past 50 years — survive, dominate and make a ton of money. IBM is only concerned about one thing: what is best for IBM. The rest of us are on our own.

Apollo cuts service fees

CHELMSFORD, Mass. — Apollo Computer, Inc. has announced a 20% reduction in hardware maintenance service charges for its line of Domain workstations, server processors and peripherals.

The company also announced a 16% reduction in monthly maintenance charges for its DN460 workstation that includes 4M bytes of memory.

Maintenance on the DN460 is now $449.

Monthly service fees for Apollo's DN660 with 4M bytes of main memory have been reduced 15% from $687 to $583.

Apollo has also added a service program that gives customers four-hour, on-site response and optional weekend, holiday and extended weekday coverage for all hardware products.

Apollo Computer is located at 330 Billerica Road, Chelmsford, Mass., 01824.

Save the

Millions of IBM PCs and compatibles are fighting for their lives.

Because users are demanding more and more storage space.

For bigger programs. For more applications. For downloading from the mainframe to the micro.

It's really more than a little PC can cope with.

Which is why a lot of people are replacing their PCs with XTs.

But now you can put an end to this senseless economic waste.

And save your company the massive cost of buying all those XTs.

With Hardcard.

A 10 megabyte hard disk drive on a card that makes a PC* function exactly like an XT. In fact, the only difference is that Hardcard has a faster access time than the XT's built-in drive.

It's also faster to install than any other add-on drive. Because everything is compressed onto a single card that quickly plugs into any expansion slot inside the PC. Which means you can rescue hundreds, even thousands of PCs in a day.

And with Hardcard's special installation software, your users can load the operating system and be ready to install their programs in minutes. Which saves your technical staff a lot of support time.

Hardcard also saves all that money you've invested in software. Because it runs all the most popular programs exactly like an XT would. With no extra fuss or modification. And its built-in file directory lets users arrange their files anyway they'd like. So they can boot up any application at the touch of a key.

As for reliability, there's simply less to go wrong. Because Hardcard has fewer parts than other drives. And absolutely no cable connections. Which makes it twice as reliable as the XT's built-in drive.

And Hardcard is the only add-on drive that lets your users keep both their floppies up and running.

But perhaps the most reassuring thing about this revolutionary

PCs.

concept is that it is based on totally non-revolutionary technology: the Winchester hard disk.

In fact, Hardcard was created by some of the same people who pioneered the 8" and 5¼" Winchester drives. And their company has a long history of producing reliable drives for some of the biggest computer manufacturers in the industry.

Because of Hardcard's superior reliability, we can offer you a warranty that goes well beyond the usual 90 days. We give you a full year. Should anything go wrong within the year, take it to your nearby authorized service location, and you'll get a replacement Hardcard. Immediately. Which means little to no down time.

And the price? Affordable enough to turn all your PCs into XTs.

Hardcard will be available during October at your local computer dealer. In the meantime, write for more information:

Plus Development Corp.,
1778 McCarthy Boulevard,
Milpitas, CA 95035.

And do your part to save these friendly, intelligent little machines.

*Hardcard is compatible with IBM PC, IBM PC XT, Compaq Portable, Compaq Plus, AT&T PC 6300.

Plus and Hardcard are trademarks of Plus Development Corporation. IBM, IBM PC and IBM PC XT are trademarks of International Business Machines Corporation. Compaq Portable and Compaq Plus are trademarks of Compaq Computer Corporation. AT&T PC 6300 is a registered trademark of AT&T Information Systems, Inc.

DATA STORAGE

■ California Computer Group has released Micro-XP, a series of disk and tape subsystems for Digital Equipment Corp.'s Microvax.

The Micro-XP provides up to 1G byte of disk storage, which can be backed up by an 80M-byte removable disk or a 500M-byte Group Coded Recording cache streamer that operates at 200 in./sec.

The Micro XP-5 dual-drive storage system is said to enhance the storage capability available to Microvax users. The product consists of a 516M-byte, 9-in. disk drive with a 20-msec access time. It also has a second 516M-byte optional disk drive that gives users 1G byte of storage, the vendor said.

The Micro XP-5 drives are contained in a 28-in. enclosure that fits under a desk. It can also be rack mounted in a standard 19-in.-wide cabinet.

The product is priced from $13,450 for the 516M-byte version to $24,950 for the 1G-byte version.

California Computer Group, 3303 Harbor Blvd., G-10, Costa Mesa, Calif. 92626.

AUXILIARY EQUIPMENT

■ Mentor Graphics Corp. has released a general-purpose test fixture for its Hardware Verification System that works with the company's Idea series of engineering workstations.

The fixture is said to provide universal sockets in place of probe leads. It can be used with any device package ,including dual-in-line packages, leadless chip carriers and pin grid arrays with up to 20 by 20 pins.

The unit costs $5,000.

Mentor Graphics, 8500 S.W. Creekside Place, Beaverton, Ore. 97005.

■ Cardamation Co. has unwrapped two punched card peripherals — a card reader and a reader punch — for the IBM System/36 Personal Computer.

The CT300/31 Card Reader includes a 300 card/min. 80-col. reader, an RS-232C asynchronous interface to the IBM Personal Computer workstation and a software handler on diskette for the IBM System/36 Personal Computer connection. It costs $2,645.

The RP8531 Reader Punch includes a 66 card/min. reader or a 200 char./min. reader, an RS-232C interface and software on a diskette. It costs $6,690.

Rental terms for both units are available.

Cardamation, P.O. Box 746, Frazer, Pa. 19355.

■ Test & Measurement Systems, Inc. has released a programmable video signal generator for testing and evaluating color and monochrome video monitors.

The Model VG-804, manufactured by Astro Design, Inc. of Denen-Chosu, Japan, is said to operate at horizontal scan rates up to 99 kHz and dot clock frequencies from 4.38 MHz to 50 MHz. It has both analog and transistor-transistor logic outputs for connection to the monitor under test.

The unit generates vertical and horizontal color bars and gray scales, cross hatch and characters. It costs $5,700.

Test & Measurement Systems, Suite 301, 349 Cobalt Way, Sunnyvale, Calif. 94086.

■ Industrial Vision Systems, Inc. has unwrapped a 400 dot/in. digitizing scanner that is said to scan paper documents up to 36-in. wide by any length and convert them to a digital raster file in compressed or uncompressed format.

The E/Scan Model ES400 is said to be useful for inputting drawings to computer-aided design workstations or image management systems, performing electronic restoration of drawings or faxing large documents.

The unit costs $79,000. Interfaces are available to connect the scanner to an IBM Personal Computer, a Multibus-based system and a Versatec plotter.

Industrial Vision Systems, 452 Chelmsford St., Lowell, Mass. 01851.

■ Acrosystems Corp. has released an I/O module for its Acro-900 Intelligent Data Acquisition and Control System.

Typical applications of the Model 913 include machine on- and off-timing, dig-

IBM's most powerful PC word

IBM DisplayWrite 3.
For small jobs to big ones,
from PCs to mainframes.

Whether you're the writer or the typer or both, how you put words to paper should be limited only by your needs, not by your tools.

Which is the whole idea behind IBM DisplayWrite 3.

It's the latest PC version of IBM's DisplayWrite Series; software that works with a variety of IBM office systems.

So it not only turns your PC into a powerful text processor, DisplayWrite 3 goes beyond your PC.

It lets you exchange documents with a big computer, like a properly equipped IBM mini or mainframe.

DisplayWrite 3 is "menu-driven" to make learning fast and straightforward.

It lets you do all the expected things, like centering and justifying and moving text every which way.

Plus a number of highly unexpected things, such as automatic outlining and footnoting.

You can edit parallel columns of

SYSTEMS & PERIPHERALS

ital control and status checking. The unit is a 60-channel digital I/O module. The 60 bidirectional lines may be used as either digital input or output, and the software is programmable on a per-line basis, the vendor said.

The Model 913 costs $695.

Acrosystems, 66 Cherry Hill Drive, Beverly, Mass. 01915.

■ Hewlett-Packard Co. has released 14 emulation subsystems to expand the processor support capabilities of its HP 64000 Software Design Center.

The subsystems are said to provide a link between the software development environment and the target system. The emulation subsystem models are for processors that include the Fairchild Camera & Instrument Corp. F9450; Motorola, Inc.'s 68000 (both 64 and 68 pin probes), 68008, 68010 (both 64 and 68 pin probes) and 146805E2; Texas Instruments, Inc.'s TMS32010; Zilog, Inc.'s Z80; Intel Corp.'s 8086/8087, 80C86, 8088/8087 and 80C88; Hitachi Ltd.'s 6301/6303 V series; and NEC Corp.'s 70116 and 70108.

Prices range from $4,100 to $8,800.

HP, 3000 Hanover St., Palo Alto, Calif. 94304.

■ Preston Scientific has announced that its PMC series of analog-to-digital subsystems is now able to interface to Masscomp's MC-500 computers.

The PMC series will interface Preston's 1-MHz 15-bit GMAD1A multiplexing analog-to-digital converters to Masscomp's MC500 computers via the Masscomp CSP-50006 customized interface package.

The PMC interface package includes a programmable crystal-based clock, output data memory, channel address memory to control up to 4,096 data channels and front panel off-line control modes.

The PMC interface price is dependent upon system configuration, conversion rate and resolution. Prices typically range from $15,500 to $23,100 for 32- to 128-channel 15-bit 1-MHz systems.

The Masscomp CSP-50006 interface kit is available from Masscomp at One Technology Park, Westford, Mass. 01886.

Preston Scientific, 805 E. Cerritos Ave., Anaheim, Calif. 92805.

■ International Imaging Systems, Inc. has released its Model 6700 Image Processor for applications requiring data acquisition and simultaneous real-time processing, such as hardware histogram generation for statistical analysis.

Applications for the unit range from digital angiography and cardiovascular im-

Continued on page 70

XEROX

from page 63

of color monitors and printers, tape drives and graphics electronic drawing units.

The IEEE 488 access will enable Xerox workstations to support engineering test equipment, speech synthesizers and a variety of measuring devices.

The Busmaster board can be connected to any Xerox 1108 processor with the CPE Expanded Processor Option, containing expanded 12K-byte control store, floating-point processor and parallel I/O port.

The Busmaster option is priced at $3,995.

In addition, Xerox announced that users of the 1100 series of AI workstations can now directly interface their workstations to the Xerox 4045 Laser CP printer. The printer offers resolution of 300 by 300 dot/in., up to 36 type fonts and printing speeds of up to 10 page/min.

Deliveries of the Xerox 4045 CP printer for Xerox AI workstations are scheduled to begin in the first quarter of 1986. The printer is priced at $4,995.

Xerox Systems Group is located at Xerox Centre, 101 Continental Blvd., El Segundo, Calif. 90245.

processing ever? That's the whole point.

text, then re-edit without a lot of rethinking.

You can print one document while you work on another.

You can produce form letters that seem more like personal letters.

You can check your spelling (with the help of a built-in dictionary) while you hyphenate and paginate in one pass.

You can even process numbers. DisplayWrite 3 can add, subtract, multiply and divide.

And if, after writing an important proposal, you need to change your product's name from Sudso to Sudsy in 156 places, you can, automatically.

To learn more, call your IBM marketing representative, or visit an IBM Product Center or Authorized IBM PC or Software Dealer.

HOW TO [illegible] UP AND [illegible].

THE DATAPHONE II SYSTEM. [illegible]

The basics.

Build on the basics.

Today, you're more dependent on your data network than ever before. You have no time for downtime. You need reliable data communications equipment that can keep your network running strong. That's the DATAPHONE® II System from AT&T.

The DATAPHONE II System is an evolving line of high-performance data communication products—modems, multiplexers, data service units and diagnostic control devices—that combines data transmission with real-time diagnostics and sophisticated network management and control.

It's a modular system of hardworking components, designed to keep your network up and running. And to easily grow in size, speed and diagnostic capability to meet your changing needs.

Whether you have an analog or digital network, the DATAPHONE II System offers a full line of microprocessor based private line modems and data service units to provide reliable transmission and sophisticated diagnostics. These modems are the backbone of our system.

From this base, you can enhance your system in easy, planned stages. You can build an extensive network management system to match your precise needs.

To really get the most of your network, you need to make maximum use of your transmission facilities. The DATAPHONE II System offers a full line of multiplexers to meet that need, and to satisfy both point-to-point and multipoint requirements. They get your data traffic moving fast and minimize line costs. All of these multiplexers work with our analog modems and DSUs. And they connect to our System Controller to give you total network management.

Recent additions to the DATAPHONE II multiplexer line include: The 735 T-Mux, a high-speed, time-division multiplexer for T-1 facilities. The 718 Stat Mux, a statistical multiplexer with unique expansion capabilities. The 719 Networker,

[illegible]

Add on a little more.

Get as big as you want.

a combination of statistical multiplexing and data switching.

We're determined to keep the DATAPHONE II System at the leading edge of technology. That's why we're constantly researching and developing new products and enhancements to keep your information on the move.

Our latest digital product offering includes two new data service units, the 2500 and 2600. The feature-rich 2500 offers quick, on-site, graphic, LCD displays of test and fault reports. The 2600 provides all the features of the 2500 and the added bonus of advanced diagnostics through connectivity to the DATAPHONE II System Controller.

You can be certain a DATAPHONE II System is the right choice, offering the capability you need now with flexibility for the future.

And AT&T backs the DATAPHONE II System with the largest, most experienced sales and service force in the industry. We're available 24 hours a day to provide support and service, to troubleshoot faults and prevent problems before they occur.

To learn how our DATAPHONE II System can meet your needs from start to finish, call your AT&T Information Systems Account Executive. And ask about our flexible purchase and leasing options. Or call 1 800 247-1212 for more information.

AT&T

The right choice.

REPORT

from page 63

Hewlett-Packard Co. HP 3000 machines and the IBM 4300 series and range in value from less than $60,000 to approximately $1 million, according to the report.

IDC said that small-scale computers traditionally range from 16-bit multiuser systems to small business machines. Typical systems include the Altos Computer Systems, Inc. ACS 68000; Plexus Computers, Inc.'s P/60, DEC's PDP-11/34 and the IBM System/34.

Minicomputers can be characterized as having either 8-, 16- or 32-bit word lengths, from 0.1M to 32M bytes of main memory, bus architecture and an overlapped processing type — as opposed to parallel processing in a mainframe and serial processing in a microcomputer.

Minicomputers excel in time-sharing and in applications requiring distributed processing, IDC noted. Typical minicomputer uses include data base management, front- and back-end processing, data communications, data collection and validation, materials handling, industrial control, manufacturing and engineering tasks and office automation.

Several disadvantages

Departmental users are finding that microcomputers have several disadvantages when compared with minicomputers, the report said. Personal computers might not have adequate storage for departmental data bases, while most microcomputer-oriented local-area networks have primitive operating systems that do not automatically protect data with record lockout as they are updated, the report said. Microcomputers also lack the ability to back up data with a centralized procedure, the report added.

Data processing is evolving to the point where companies have a mixture of the three kinds of computers — mainframes, minis and micros. As this approach to computing takes hold, organizations must learn to manage and control the resources associated with each system, IDC said.

Staff, equipment and data are the three major resources in a minicomputer environment, the report said. Staff is needed to manage the installation, to develop programs and to operate the equipment. A major staff-related function is training, for DP staff as well as for end users.

Management of equipment demands an evaluation of performance, capacity planning and maintenance of the equipment. Data management requires procedures that guarantee the accuracy and validity of the data, controlled access to the data and backup and recovery procedures for the data.

Auditing minicomputers — being able to reconstruct a transaction — requires documentation of operating procedures and programs and a log for operations and daily transactions, according to the report. Management must specify responsibilities for computer programming, operations, data authorization and output use and should consider separating these functions to protect the organization from computer fraud, the report said.

Physical security of equipment

Another function in minicomputer management is the physical security of the equipment, programs and data. Access should be limited, and changes should never be made to production programs. Data in both read and write modes should be protected from unauthorized access.

Finally, plans must be made to correct mistakes and to repair equipment so that operations can continue despite errors and malfunctions within the system, the report said. The system should be designed so that erroneous data is detected and corrected in a timely fashion. This function includes having proper backup procedures, logs, maintenance contracts and spare parts.

The company should have a disaster recovery plan in the event that everything goes wrong, the report said. There should be a method established to recover data and programs and an alternative arrangement made for processing equipment.

More information can be obtained from IDC, Five Speen St., Framingham, Mass. 01701.

aging to military surveillance and radar/infrared imagery.

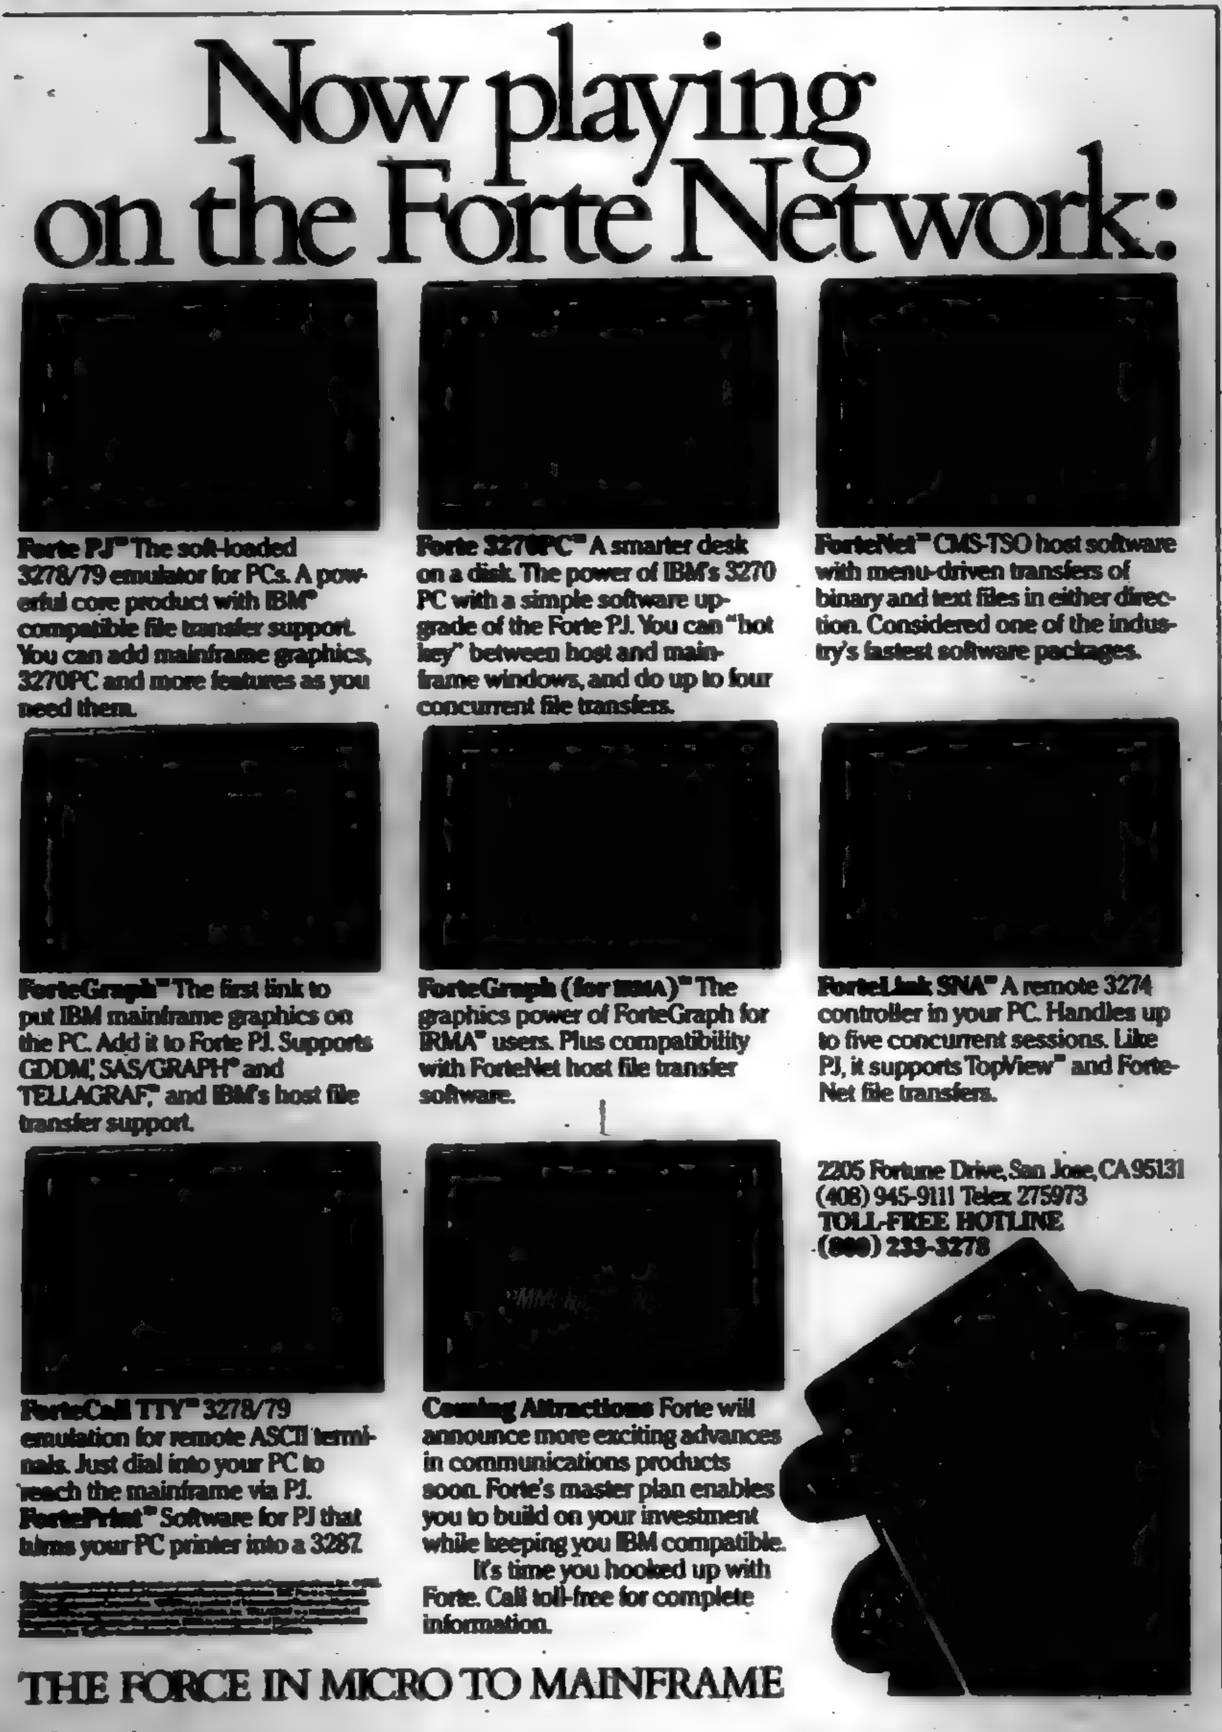
The Model 6700 is said to accept digitized video at up to 13.5 MHz from various input sources supplying synchronization and data clock signals. The unit offers a 16-bit bidirectional port. It has a maximum capacity of 16M bytes of image memory.

The basic unit — comprised of an interprocessor controller, synchronous controller, I/O matrix switch and video pipeline/graphics processor costs $27,950.

A typical version with 70K bytes of image memory and a high-resolution output unit added to it costs approximately $70,000.

International Imaging Systems, 1500 Buckeye Drive, Milpitas, Calif. 95035.

"I called you all together today in order to figure out the instruction manual for my new personal computer."



Now playing on the Forte Network:

Forte PJ™ The soft-loaded 3278/79 emulator for PCs. A powerful core product with IBM® compatible file transfer support. You can add mainframe graphics, 3270PC and more features as you need them.

Forte 3270PC™ A smarter desk on a disk. The power of IBM's 3270 PC with a simple software upgrade of the Forte PJ. You can "hot key" between host and mainframe windows, and do up to four concurrent file transfers.

ForteNet™ CMS-TSO host software with menu-driven transfers of binary and text files in either direction. Considered one of the industry's fastest software packages.

ForteGraph™ The first link to put IBM mainframe graphics on the PC. Add it to Forte PJ. Supports GDDM,® SAS/GRAPH® and TELLAGRAF,® and IBM's host file transfer support.

ForteGraph (for IRMA)™ The graphics power of ForteGraph for IRMA™ users. Plus compatibility with ForteNet host file transfer software.

ForteLink SNA™ A remote 3274 controller in your PC. Handles up to five concurrent sessions. Like PJ, it supports TopView™ and ForteNet file transfers.

ForteCall TTY™ 3278/79 emulation for remote ASCII terminals. Just dial into your PC to reach the mainframe via PJ.
FortePrint™ Software for PJ that turns your PC printer into a 3287.

U.S.-Japan chip dispute heats up

System vendor tensions eased by ending of duties

By Clinton Wilder
CW Staff

WASHINGTON, D.C. — Trade tensions between U.S. and Japanese semiconductor manufacturers heated up last week, while the tensions between computer system makers in both countries showed signs of easing.

At press conferences here and in San Francisco last week, the Japanese chip makers' trade group angrily denied allegations of trade barriers recently made by the U.S. Semiconductor Industry Association (SIA).

A spokesman for the Electronic Industries Association of Japan (EIAJ) called the SIA's allegations a "red herring" and claimed U.S. vendors hold a larger share of the Japanese semiconductor market than the Japanese do in the U.S.

The EIAJ announcement came just three days after Japan and the U.S. announced they would remove import duties on various types of computer hardware. Japan will remove its 4.9% duties on computer systems and parts and its 6% duty on peripherals, while the U.S. will drop its 4.3% duty on parts. The U.S. will retain duties of 4% on peripherals and 4.3% on systems.

"Our companies are most pleased by this agreement," said Oliver Smoot, executive vice-president of the Computer and Business Equipment Manufacturers Association. "We interpret it as reaffirming Japan's commitment to further open its market to foreign competitors."

But the war over semiconductor trade practices appears more intense than ever. In the EIAJ response to the SIA complaint, EIAJ spokesman Tomihiro Matsumura charged that U.S. chip makers are using Japan as a scapegoat for their poor performance during the industry's deep slump.

"A single segment of the U.S. semiconductor industry is exploiting general trade tensions in an attempt to seize a guaranteed share of the Japanese market," according to Matsumura, senior vice-president and director of NEC Corp. "The Japanese semiconductor market has been completely liberalized for trade and investment for over a decade."

The SIA recently filed a complaint with the Office of the U.S. Trade Representative under the Trade Act of 1974, charging the Japanese government with discouraging Japanese firms from making purchases of U.S.-made chips. In conjunction with the EIAJ's formal response filed with the Trade Representative's office last week, Matsumura said the complaint "has no basis in law or reality" and fails to cite any Japanese government acts that could be interpreted as trade barriers.

"SIA simply ignores the historic 'boom-

Cunningham upbeat after first month at CCI

By Charles Babcock
CW New York Bureau

NEW YORK — Claiming to "have worked harder and more productively than I have in a long time," former Wang Laboratories, Inc. President John F. Cunningham said he has been able within one month to set Computer Consoles, Inc. (CCI) on a new course.

Much of his time has been spent traveling between the Rochester, N.Y., Irvine, Calif., and Reston, Va., operations of the small office automation company. He became chairman and largest shareholder of the firm July 22. Cunningham said he has met most of the company's 1,500 employees individually and sat down with them in groups of 45 to discuss the company's future.

He left Wang, where he was a respected marketing force in a $2 billion company, to assume the top job in a company with revenue of $131 million last year. Cunningham said he likes the small company environment. "If it's broken, you can fix it yourself," he said at a press conference here recently.

Computer Consoles is not broken, but it has been limping through 1985. In the first six months of the year, it lost $10.1 million on revenue of $61 million after earning $6.3 million in 1984.

Cunningham said that when he decided to leave Wang, he had looked for a small company with good technology and the potential for rapid growth but one that needed his marketing skills. After 30 days at Computer Consoles, he said, he realized he had found just what he wanted, "and more."

Like Wang, Computer Consoles has been forced to lay off employees and cut costs since the start of the year. Asked how he would cut costs, Cunningham said most of the savings still to be achieved could be found in discretionary expenses, such as travel and entertainment.

Cunningham was introduced by Herman A. Affel Jr., the man who Cunningham replaced as chairman of Computer Consoles and who is now vice-chairman. Affel said the company had been looking for a strong chief operating officer for several years and thought it had found one in its former president, Vaemond H. Crane. Crane resigned after 18 months, however, to become the chairman of a California start-up company, MIPS.

Affel, 66, said he was happy to step aside for Cunningham and that the board of directors had quickly reached agreement with him on his new post. Cunningham had initiated the discussion by contacting a Computer Consoles board member, he said.

IBM software pact raises questions

INDUSTRY INSIGHT
Peter Bartolik
CW Senior Editor

One key ingredient was missing from the vague announcement that IBM and Microsoft Corp. had signed a development agreement for work on future operating systems and systems software products — why?

Without access to the actual fine print of the agreement [CW, Aug 26], it is hard to know exactly what is intended and why it was announced. But it would seem that IBM has done little more than formalize an already tightly knit working relationship with the Bellevue, Wash.-based microcomputer software company.

Many in the industry seem to have accepted the agreement as an ironclad declaration that the Blue Behemoth has absolutely no intention of turning its back on Microsoft's MS-DOS operating system standard. That seems like a fair interpretation; but, realistically, for IBM to desert abruptly the standard that has gained it preeminence in the world of micro hardware would have made no sense.

With a lock on the hardware arena that no antitrust whiz kid could ever bust, why on earth should IBM risk the possibility of making it easier for the spawning of an alternative standard. If IBM turned a cold shoulder to third-party applications software vendors, they would have no choice but to adopt and nurture another vendor such as the newly cooperative Apple Computer, Inc.

If we take, for the sake of argument, the view that anything IBM does is to gain a competitive advantage, perhaps analysts and vendors of IBM-compatible systems should not be breathing so easy.

■

If anyone doubted that Wang Laboratories, Inc.'s problems run deep, John Cunningham's recent remarks [see story above] should pro-

See WANG page 75

Apple plant sold to Alps Electric

GARDEN GROVE, Calif. — As part of its move to cut costs by transferring production to third-party manufacturers, Apple Computer, Inc. last week sold its component plant here to supplier Alps Electric USA, Inc., a subsidiary of Japan's Alps Electric Co. Terms of the sale were not disclosed.

Alps will continue to make keyboards and mouse input devices for the Macintosh, Apple IIe and IIc microcomputers at the plant. Until the sale, Apple employees manufactured those products. Alps will also build components and peripherals for other OEMs in the computer, communications and automobile electronics industries.

The automated plant is Alps' first production facility in the U.S.

"Selling the Garden Grove operation is in keeping with our plans to concentrate our efforts on personal computers while relying on third-party vendors to supply us with components and accessories," said Delbert W. Yocam, Apple's executive vice-president of product operations.

Copyright protects software development investment

FIRST IN A SERIES

By Jerome Roberts
and Michael Brownell
Special to CW

Successfully developing and bringing a software product to market involves a substantial investment of human and financial resources. However, the value of the investment may be greatly diminished — or lost altogether — if the proprietary interest in the software product is not adequately protected.

The protection of that proprietary interest depends upon the judicious use of a combination of legal and physical tools designed for such a purpose.

The legal tools to be explored in this series include copyright, trade secret, trademark, patent, contract and semiconductor mask work law. This series is not intended to be exhaustive or to make the reader a legal expert in the area. Rather, it is intended to provide general information to assist the reader in recognizing where attention and a professional opinion, if applicable, may be advisable.

COPYRIGHT PROTECTION

Federal copyright protection is available to protect computer source and object codes, data bases, screens, report formats, documentation and any other manifestation of software that is fixed in a tangible medium of expression. While this article is limited to copyright protection under U.S. law, many foreign countries provide similar protection. The protection afforded by copyright is limited. It gives the owner of the copyright the exclusive right to copy, distribute and prepare derivative works from the literary or pictorial elements of the software (for example, the written code, manuals or report formats).

Copyright law does not protect the intangible ideas, designs or processes contained in the software. For example, the concept of the "cell" used in spreadsheet software is not copyrightable. Most important, copyright protection does not protect the trade secrets contained in the software.

The owner automatically owns, at the moment it is first fixed in a tangible medium, the exclusive copyright interest in the software created by either the owner or its employees within the scope of their employment, so long as such software has not been copied from an existing source. Under such circumstances, no additional action need be taken to vest copyright ownership in the owner. Ownership of the copyright for software developed by independent contractors under contract with the owner will vest in the independent contractor unless additional steps are taken by the owner to secure ownership. It is noted, however, that the independent contractor context raises many specific issues (most notably, what distinguishes an independent contractor from an employee for U.S. copyright purposes), which will be addressed in a subsequent article.

The corporate owner's copyright ownership continues for 75 years. If the owner is an individual, the protection continues for the length of his life plus 50 years. In either case, the protection can be lost if the software is published without a valid copyright notice as discussed below.

THE COPYRIGHT NOTICE

The following steps serve to preserve the owner's copyright ownership and the availability of special remedies provided under the 1976 Copyright Act.

Software that is distributed publically must contain a publication notice in the following format:
COPYRIGHT © 198
[NAME OF OWNER]
If the software is published without a valid copyright notice, the owner forfeits its copyright interest unless it promptly cures the omission in the manner required under the Copyright Act. The date in the notice should be the year of the first publication, and in case of doubt it is best to select a year prior to, rather than after, the year of actual publication. The word "copyright," the abbreviation "Copr." or the letter "c" in a circle may be used. It should be noted that although the letter "c" in a circle is not offered in many print sets, the U.S. Copyright Office has not accepted any substitute symbols — for example, "(c)." Although not required under U.S. law, the owner may wish to include the following clause in its copyright notice so as to avail itself of copyright protection in certain South American countries: "All rights reserved."

The notice should be placed on all media labels, embedded within the program code as a nonexecutable comment, placed on all documenta-

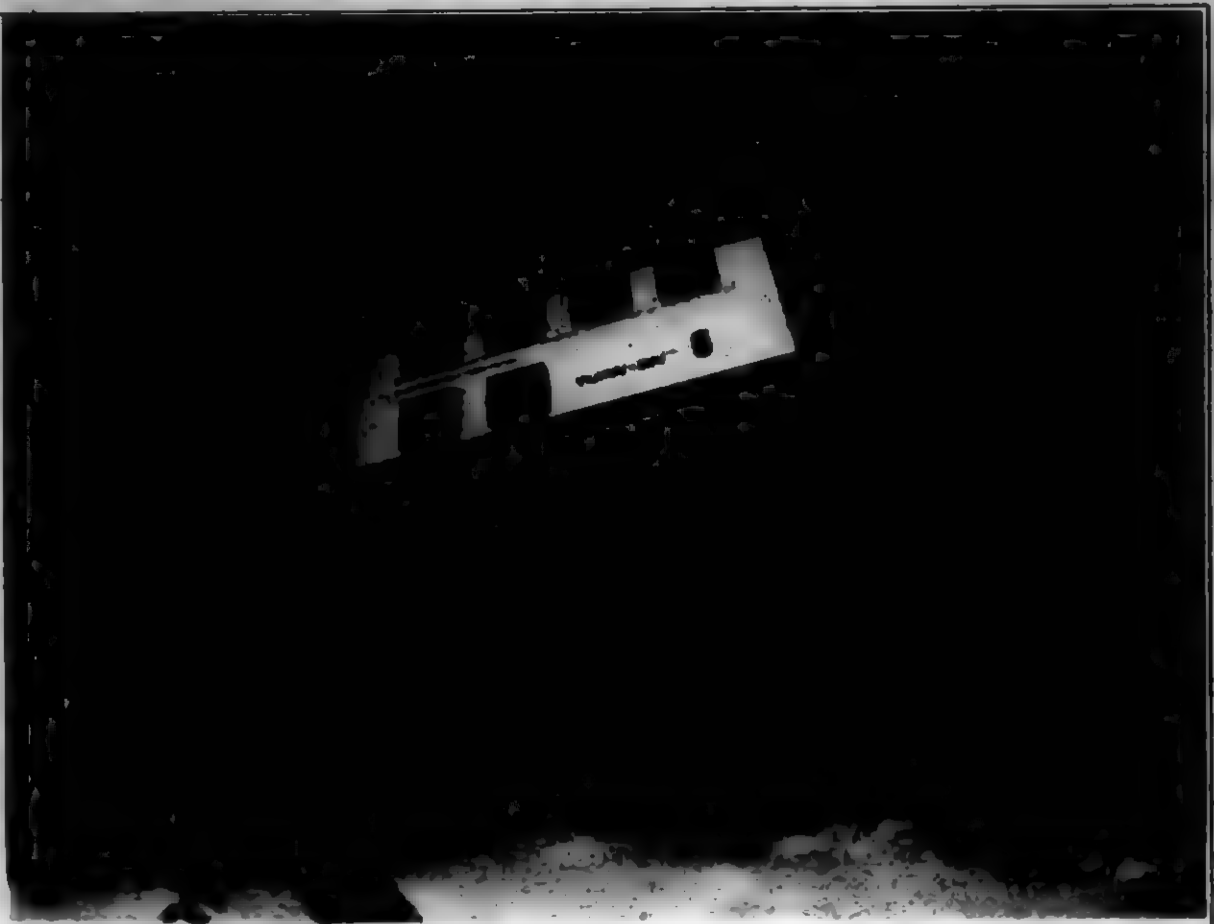
Roberts and Brownell are attorneys with the law firm of Berman, Roberts & Kelly in Chicago. This firm's practice deals with legal issues relating to procurement, development, distribution, management and protection of computer resources.



Turn on, access, and turn off your microcomputer. From anywhere.

PRESENTING TURN-ON™

TURN-ON is a totally unique intelligent power controller that provides unattended remote access plus power protection to your microcomputer. Now you can avoid arranging "call-in" schedules or peak hour overloading. When the phone rings at your powered-down micro, TURN-ON automatically powers-up the peripherals and then the computer, puts your program in operation, and upon completion powers-down the system, leaving a visual signal that remote activation has occurred. Your computer no longer needs to be left on or attended all the time.

THE MOST FULLY-FEATURED DEVICE OF ITS KIND

TURN-ON has all the finest available telecommunications features and much more. It is available as a turn-key hardware/software system that goes far beyond power strips and other remote access devices. TURN-ON gives you automatic log-on 3 phase security: ■ User ID ■ Password protection ■ Optional dial-back confirmation. TURN-ON's file transfer program also provides transfer protection by file name.

The Dyna-Talk software permits automatic recording of every incoming modem connection by user ID, tells you which program the user executed, and the time and date of the call. TURN-ON's software is very user-friendly, menu-controlled, easy to use, and PC DOS 2.0 and above compatible. AC line filtering gives complete power surge protection for all devices plugged into the six power outlets. No separate power strip is needed.

TURN-ON PUTS YOU IN CONTROL

Remote distributed micros are now available to you 24 hours a day for such tasks as electronic mail, transferring programs and data files, or the running of other application software. An optional 25 pin connector allows the computer to stay on past phone hangup or manual power-off, so any required processing can be completed.

With TURN-ON, you'll save time and money because you now control and manage the exchange of information with your computer in the fastest, most efficient way possible.

Call today for more information on how easy it is to Turn-On your computer system.

PC DOS is a registered trademark of International Business Machines Corp. Turn-On and Dyna-talk are trademarks of Dynatech Computer Power, Inc.

Computervision appoints chief operating officer

BEDFORD, Mass. — Computervision Corp. recently named a member of its board of directors, Robert L. Gable, to the new position of chief operating officer and vice-chairman.

Gable, who was a vice-president and group executive at Kidde, Inc., will be responsible for all day-to-day operations, company President and Chief Executive Officer James R. Berrett said in a statement.

The financially ailing manufacturer of computer-aided manufacturing and design systems has suffered two consecutive losing quarters, following a record-breaking fiscal year in which revenue grew by 40%.

Berrett said Gable will report to him and "brings to our top management team special added strength to help us meet the complex and demanding challenges of doing business today in our industry and worldwide markets."

Gable was elected to Computervision's board of directors in 1974 and has served as chairman of the audit committee.

Prior to joining Kidde in 1966, he was president and chief executive officer of Craig Systems Corp. of Amesbury, Mass.

Former IBM exec to lead Bell Atlantic's Sorbus arm

FRAZER, Pa. — Sorbus, Inc., the third-party maintenance organization owned by a subsidiary of Bell Atlantic Corp., recently named as its president a 30-year veteran of IBM's field engineering and customer service operations.

Louis J. Ross, former director of quality and organization for the combined field engineering and customer service division of IBM, was named to replace Ronald A. Wallace, who retired.

Sorbus is a subsidiary of Bell Atlantic Enterprises and was acquired last year from Management Assistance, Inc.

Ross joined IBM as a customer engineer in 1957 after service with the U.S. Marine Corps. He held a number of positions in personnel, operations and measurements and field engineering before being assigned international responsibilities in 1967.

In 1980, Ross was appointed director of IBM's quality/field engineering division in the U.S. He was elevated to his most recent post two years later.

The retiring Wallace was affiliated with Sorbus for 17 years and served as president since 1981.

ADP announces record earnings

ROSELAND, N.J. — Automatic Data Processing, Inc. (ADP) recently announced record revenue and profits for the fourth quarter ended June 30 and its first billion-dollar year ever.

The computing services firm said revenue for the quarter was $266.3 million, up 14% from $233.1 million in the fourth quarter a year earlier.

Profits for the quarter just ended were $26.2 million, or 73 cents per share, compared with $21.8 million, or 62 cents per share.

Revenue up 16% for year

For the year, revenue was $1.03 billion, up 16% from year-earlier revenue of $888.9 million. Profits for the year were $87.8 million, or $2.47 per share, up 17% from $75.1 million, or $2.14 per share the previous year.

Josh S. Weston, president and chief executive officer, announced the results in a statement noting it was the company's 36th consecutive year of record revenue and profits. He said that the current fiscal year is expected to be as good. "Earnings per share are projected to grow by close to 20%, and revenue growth should be close to 15%," he said.

The date in a notice affixed to unpublished software should be the date the software was substantially completed.

How to advertise in every major computer market in the world as easily as you advertise in the U.S.

CW INTERNATIONAL Marketing Services will help you penetrate the most profitable computer markets worldwide — easily, effectively, and economically.

Your ads will receive the attention they deserve. Our network of more than 55 computer publications in over 25 countries is the largest in existence. Over 9,000,000 computer-involved people around the world rely on our publications for the information they need to stay ahead.

With more than 10 years experience in international marketing, we're the only service of our kind. We can help you make your ads more effective. Our local offices can translate your ads for a 15% surcharge on the space you purchase.

We'll help you increase your market penetration. We're also available to advise you on your campaign strategy — such as when to advertise in order to coincide with special-focus issues and trade shows. And you'll be able to advertise in even more markets when you take advantage of our corporate discounts.

All you need to do is send us your advertising materials. We'll handle all the transactions. And we'll bill you in U.S. dollars so you won't have to worry about exchange rates.

Call Diana La Muraglia today if you want to reach the computer buyers in any of the following countries: Argentina, Australia, Brazil, Canada, Chile, Denmark, Finland, France, Greece, India, Israel, Italy, Japan, Korea, Mexico, Norway, People's Republic of China, Saudi Arabia, South Africa, Southeast Asia, Spain, Sweden, The Netherlands, United Kingdom, Venezuela and West Germany.

You can reach her toll-free at (800) 343-6474. In Massachusetts call (617) 879-0700. Or you can reach her through Telex, at number 95-1153. Or, if you prefer, fill out the coupon below and return it today. Do it now. The sooner we hear from you, the sooner you'll hear from our readers.

THE MONITOR FOR CICS

ONE STOP CICS MANAGEMENT!

CICS PERFORMANCE CONTROL...from LANDMARK SYSTEMS CORP.

Online Graphic Monitor

For any level of operations or management to identify performance problems immediately—without intervention!

- Powerful color histograms
- Sight and sound alerts
- Cycles on user intervals
- System, application and user targets

Activity Monitor

Crises intervention tool that allows recovery, prevents outages, frees "hung" terminals, and isolates problems.

- Realtime problem analysis
- Cancels problem tasks
- Shows transaction problems—loops, ENQUEUE lockouts and VSAM string waits

Batch Reporting

Summary, reporting and compression of multiple systems allowing long range data retention for utilization analysis and planning.

- Flexible report writer
- Cost/accounting support
- Graphic/tabular reporting
- Historical archiving with summarization

Online Browse

Online access to transaction data, "after-the-fact" problem determination and replay of performance for the day.

- Browse data selectively
- Review past performance
- Easy-to-read formats
- Access each transaction record online

Data Collection

Captures transaction level information without extensive file handling. Provides basis for online and batch reports.

- Disk data compression
- Very low overhead
- Automatic re-positioning
- PAII, CMF NOT required
- PAII conversion provided

Storage Monitor

Provides information for and analyzes effects of tuning CICS and operating system. Aids in pinpointing problems.

- Analyze CICS storage online
- Display, alter storage
- Show program compression
- Track temporary storage
- Show subpool use

File Monitor

Pinpoints problem files/volumes and shows effects of tuning. Aids VSAM file definition. Analyzes I/O contention.

- Each CICS I/O measured
- CICS counts captured
- Provides VSAM split data
- Creates better balance and performance

Application Interface

Identifies and tracks specific applications and events. Supports UFO™, MANTIS™, GENR/OL™, NATURAL™, and DMS™. User interfaces, clocks and counters.

Resource Controls

Prevents system outages by automatically cancelling applications that exceed CPU, file, I/O or storage limits.

Supertrace

Gauges effect of new applications on system, reduces testing time, allows production tracing and enhances performance.

- Quick application timer
- Resource consumption data
- Application debugging tool
- Alternative to AUX TRACE in production system

Quadrex named Sperry reseller

BLUE BELL, Pa. — Sperry Corp. recently announced that it had signed on its first national distributor to resell Sperry's computer products to value-added resellers.

Quadrex Computer Systems, Inc., a Campbell, Calif.-based subsidiary of Quadrex Corp., was signed on to resell a line of Sperry products — including microcomputers, peripherals, software and minis — based on AT&T's Unix operating system.

The agreement represents Sperry's growing commitment to indirect sales channels, according to Rich Lucia, director of Indirect Sales Marketing for Sperry.

NICKELS AND DIMES

Computer & Communications Technology Corp. announced revenue for its second-quarter period of $25.4 million, compared with $29.6 million for the same quarter of the previous year. Profits were $177,000, or 2 cents per share, compared with $2.9 million, or 37 cents per share, for the same period one year earlier.

■

Integrated Software Systems Corp. announced revenue for the second quarter ended June 30 of $8.7 million, an increase of 24% from $7 million in the same quarter last year. Profits were $613,000, or 11 cents per share, up 22% from $472,000, or 9 cents per share, for the same period one year earlier.

■

Wyse Technology announced that revenue for the first quarter of fiscal 1986 ended June 30 was $29.4 million, an increase of approximately 124% over $13.1 million in the same period last year. Profits were $2.5 million, or 29 cents per share, compared with $1.4 million, or 26 cents per share, in the comparable period last year.

■

Scientific Micro Systems, Inc. announced that revenue for the quarter ended June 30 was $8.5 million, compared with $11.3 million in the same quarter one year ago. The firm posted a net loss of $740,000, or 10 cents per share, compared with a profit of $1.2 million, or 21 cents per share, in the same quarter one year ago.

■

Daisy Systems Corp. announced that revenue for the third fiscal quarter ended June 30 was $32.5 million, an increase of 75% over $18.5 million for the comparable period last year. Profits for the quarter were $6.6 million, or 31 cents per share, compared with $2.8 million, or 19 cents per share, in the same quarter last year.

■

Micom Systems, Inc. reported revenue of $66.4 million for the first period of fiscal 1986, compared with $45.2 million in the corresponding period last year. Profits were $2.4 million, or 14 cents per share, compared with $6.6 million, or 28 cents per share, for the prior year's first quarter.

WANG

from page 71

vide some enlightenment. In his first public appearance after departing the post of president and chief operating officer of Wang to take the top spot at Computer Consoles, Inc., Cunningham said he had never heard of his new company until earlier this year and believed Wang's chairman, An Wang, was at a similar disadvantage.

Granted, Computer Consoles is a relatively small player in the office automation field. But any competitor is a potential challenger and justifies at least examination, if not recognition.

In light of the fact that Computer Consoles has sewn up some impressive international OEM deals for its office products, the ignorance at Wang indicates a lack of attention to the basics.

■

Other than affected unions, nobody seems too surprised by AT&T's decision to ax 20% of its Information Systems group work force.

But don't look for any great turnaround in that corner until AT&T manages either to bring out an impressive state-of-the-art line of computer products or until it hooks up with an experienced challenger to IBM.

The view in this corner is not to hold one's breath for either development.

■

At least one semiconductor manufacturer is seeing a continuation of the yearlong recession that has that industry on the ropes.

In a Securities and Exchange Commission filing related to an offering of convertible shares, National Semiconductor Corp. revealed that sales are off considerably in the current quarter.

From June 1 through July 28, sales were only $175.7 million, compared with $207.1 million for the comparable period in 1984.

Profits headed south, with a loss of $44.3 million for the period, compared with profits of $2.4 million a year earlier.

Qualifying the report, National Semi said the results are not necessarily indicative of what can be expected for the quarter and do not reflect normal adjustments made at the end of each quarter.

But if a pickup in orders does not occur, significant losses are expected for the quarter, according to the company.

GREENBOOK 3 — The guide that tells you what's happening in the Australian software market.

THE ANSWER IS SIMPLY AT YOUR FINGERTIPS

● Computerworld in Australia proudly presents its THIRD edition of the GREENBOOK of Computer Software and Related Services — completely updated. ● First time computer users and current users can see at a glance what software is available. Keep up with the latest products and new companies. ● It's all listed and indexed from microcomputer-based software to software that runs on large systems. ● GREENBOOK 3 features over 2500 software products available and supported within Australia. ● It's so EASY to locate information. ● You can access GREENBOOK by applications; by industry; by package name; or host system ● Additional information includes: ☐ Profiles of Software Suppliers ☐ Description of Products ☐ Service Companies ☐ Systems Builders ☐ Contract Programmers ☐ Consultants ● GREENBOOK 3 is the largest and most comprehensive reference of applications, systems and utility software available in Australia . . . just one more of the range of information services on information technology brought to you by Computerworld Pty Limited.

CHAIRMAN

from page 71

"An Wang [chairman of Wang] was going to have his son run the company; that's no secret. So John looked around for where he could be the real boss," Affel said.

Cunningham said he had not heard of Computer Consoles until last February, and in discussing his move with Chairman Wang, he realized in July that Wang had never heard of it.

The two companies compete at least indirectly. Both sell office automation systems to small- and medium-size businesses, including legal offices. Computer Consoles sold a major system in Wang's backyard last year when it provided the office automation system to Hale & Dorr, Boston's largest law firm.

Computer Consoles is more of a vertical market manufacturer, however, incorporating special software packages on its Power series of AT&T Unix-based processors.

Cunningham is still a member of the board of directors at Wang. Attorneys at Wang are examining the relationship, and Cunningham said he would probably submit his resignation at an October board meeting.

Cunningham disclosed that he had decided to move Computer Console's headquarters, which have been in Rochester since it was founded in 1968, to Boston. A small planning and administrative staff will work with him there.

Cunningham said he will push Computer Consoles to introduce more low-end products, since its Power 6/32 Unix processor represents too much overhead for a small business. New low-end products will be announced before the start of the Sept. 18 conference on Unix in New York, he said.

Computer Consoles' core business has been selling hardware and software to specialized users such as law offices and financial service firms. Its hopes of selling to larger customers with broader needs would be based on the assumption that these customers would have the in-house technical skills to develop their own applications, Cunningham said.

He said Computer Consoles has overlooked the possibility to date of major sales to OEMs and value-added resellers, and he expects to reorient efforts in that direction over the next few months.

While he anticipates operating in the black in 1986, he said Computer Consoles could not expect to resume its rapid growth path before 18 to 24 months.

In automating an office, one must often choose between piece and harmony.

Most companies approach office automation piecemeal. So it's not surprising when their wordprocessors can't talk to their microcomputers. And mainframe text editing is frequently inaccessible to the personnel who need it most. It's also why Boeing Computer Services now introduces Boeing Office Solutions.

Boeing can integrate your current office automation hardware, regardless of brand. And we can help you choose future pieces or total systems — *without bias to a particular hardware manufacturer.*

In other words, you can come to us at any stage in the office automation process with the knowledge that we'll help you achieve harmony of hardware, software and communications.

We also offer you special software systems that can make your operations more productive . . . immediately.

For example, there's PROFS*, a system that can keep your calendar and send memos. Or DISOSS*, documentation library and distribution services. Or the Boeing Document Transfer System, a system that transforms and transmits editable

text documents between your word processing machines.

PROFS, DISOSS and the Boeing Document Transfer System all run on our MAINSTREAM® teleprocessing system. Or you can license the Boeing Document Transfer System for your own computers.

Boeing Office Solutions are just one part of Boeing's complete integrated information services. Including enhanced remote computing services. Distributed processing and micro/mainframe links. Additional software solutions. Education and training. And a variety of professional support services.

For more information or the location of the sales office nearest you, call toll free 1-800-447-4700. Or write

from page 71

and-bust' cycles of the semiconductor industry," Matsumura said. "The current slump in the U.S. industry is primarily due to depressed markets for personal computers and video games, as well as the current misalignment in exchange rates."

The EIAJ, an association of 600 Japanese business and consumer electronics manufacturers, claimed that U.S. chip makers hold a 19.1% share of the Japanese market, compared with the Japanese share of 9.6% of the U.S. market. Matsumura charged that SIA statistics showing the opposite imbalance fail to include Japanese sales of chips made by U.S. companies in off-shore plants.

The EIAJ further charged that SIA figures have downplayed U.S. vendors' share of the U.S. market by ignoring sales of chips within so-called captive manufacturers, such as AT&T and IBM.

An EIAJ spokesman claimed that such sales by U.S. companies to themselves account for approximately 32% of domestic semiconductor sales. "The SIA's failure to include those sales accounts for the large disparity between their figures and ours," the spokesman said.

Figures inaccurate, irrelevant

For its part, the SIA accused the EIAJ of juggling numbers from "a variety of nontraditional sources" to discredit the SIA complaint. "Not only are their statistics misleading and inaccurate, they are also irrelevant," according to Daryl Hatano, manager of governmental affairs for San Jose, Calif.-based SIA.

"Our goal is a share of the Japanese market comparable to our worldwide share. If they inflate our Japanese share by using those methods, our worldwide share is inflated by the same amount."

Hatano said the SIA market share figures are based on figures from what he called two "universally accepted sources" — the World Semiconductor Trade Statistics program and the U.S.-Japan High-Technology Working Group.

LSI, Kawasaki Steel to build chip facility

MILPITAS, Calif. — LSI Logic Corp., a semiconductor vendor based here, recently announced a joint venture with a $5 billion Japanese steel company to produce silicon wafers and application-specific, very large-scale integration chips in Japan.

LSI and Kawasaki Steel Corp. announced the formation of Tokyo-based Nihon Semiconductor Corp. to build a $100 million chip manufacturing facility at a site that remains to be announced. The plant is expected to be completed by mid-1987 and employ 250 people by the end of 1988.

LSI currently has another Tokyo-based affiliate, Nihon LSI Logic Corp., to market its Cmos chips in the Far East.

Nihon LSI President Keisake K. Yawata was named president of Nihon Semiconductor.

Why you should never commit to a database management system without test driving the product.

There's only one way to evaluate the performance of a fourth generation language database management system. Test drive it. Put it to work developing applications for actual problems.

When you do, you'll find that no other 4GL/DBMS can beat NOMAD2. The power and richness of its language let you conquer the toughest applications with ease. And its ability to interface with your existing databases lets you read files as well as write data with barely an effort.

We're willing to run NOMAD2 through whatever obstacle course you care to set up. And against whatever products you select for comparison. Because in a comprehensive test drive situation, not only will NOMAD2 get applications up and running fast, it will leave the competition in the dust.

NOMAD2, which runs on your mainframe or ours, is another step in the NOMAD evolution that began in 1975. For information write Roger Cox, D&B Computing Services,
187 Danbury Rd., Wilton, CT
06897. Or call (203) 762-2511.

POSITION ANNOUNCEMENTS

There Comes A Time When You Either Make A Commitment To Lead, Or Resign Yourself To Getting By.

UCCEL Chose To Lead. So Can You.

Quite frankly, we weren't always a leader in the independent software industry. It wasn't until two years ago, when we restructured our company, took on an aggressive mind-set and positive new management style, that we began to soar. Now, we're riding the crest of success, and this leadership mode reflects everyone of our people, from Programmers, to Systems Analysts, Sales, Technical Support and Software professionals. They come to us for career growth, versatility, our stimulating environment, and because winning attracts winners.

At UCCEL, you can have a direct effect on innovating a future as exciting as it is rewarding within our:

Systems Software Division

Recognized as the leading innovator in its field, this division provides data centers with proprietary products which improve productivity by speeding the workload and data flow in an IBM compatible environment. Winning professionals in the following area are currently being sought.

Sales Support

New York, Chicago, San Francisco

Opportunities exist for experienced Sales Support Representatives in our New York, Chicago and San Francisco regional sales offices. These positions will provide technical assistance in support of our new product line NOVA: PROBE and NOVA: PLAN. Responsibilities will include making pre-sales, technical and product presentations, client and sales training and direct involvement with system installation and implementation.

Qualified candidates must have a minimum of 5 years experience within a large Data Processing Center, preferably in the Capacity Planning area. Familiarity with IBM and AMDAHL systems and a working knowledge of the Operations, Scheduling, Tech Control or OS departments would be a definite plus. A Bachelor's Degree or equivalent experience is preferred.

Extensive travel within your designated region is required.

You didn't endure demanding higher education and dues paying just to get by. Join us in our commitment to lead and experience the full return on your career investment. It all begins by sending your resume, along with geographic preference to:

UCCEL Corporation
UCCEL Tower
6363 Forest Park
P.O. Box 660654
Dallas, Texas 75266

University Of Alaska
Statewide Administration
University Of Alaska
Computer Network
Network &
Communications Manager
Annual Salary Range $42,7[illegible] - $71,3[illegible]
Full Time Permanent Position In Fairbanks

The UACN provides the statewide University of Alaska campuses Computing and Data Communications services with an extensive telephone-based asynchronous network. DEC, IBM, and other hosts are linked in this and an embryonic SNA network. The Manager is responsible for evaluation, coordinating, and supervising the operations, maintenance, enhancement, and planning of these network facility and support staff.

The successful candidate must provide technical competence in communications network architecture, engineering, local area network, data communications as well as demonstrated ability in the management, planning, operation, development, and maintenance of large data communications networks. Some Alaska and out-of-state travel will be necessary.

This position will reside at the Fairbanks campus, which is the state primary residential institution. Fairbanks, located in the interior of Alaska, offers a variety of historical, cultural and year round activities. The spirit of adventure is still alive in Alaska.

Closing date: September 30, 1985.

Interested individuals should submit a cover letter, resume and three references to:

DIRECTOR OF COMPUTER SERVICES
$48,764 - $60,538

Fresno County, located in California's central valley, is searching for a dynamic, technically well-grounded executive to manage our evolving Data Processing Division. This job offers high visibility and an opportunity to make a major impact on a vital County function. The Computer Services Director oversees the division which is responsible for providing management information and office automation services to County departments. The Technical environment consists of the IBM 3083, 4341, and DEC VAX 11/780. The division also supports the County with WANG office automation systems and IBM information center products. The Director manages a staff of 116 full time professional/technical employees.

Fresno County is located centrally between Los Angeles and San Francisco at the base of the Sierra Nevadas. The City of Fresno is the County seat and has a metropolitan population of more than 287,000.

If interested, send us a resume clearly indicating your technical background, managerial experience, and salary history. Resumes and inquiries should be directed to:

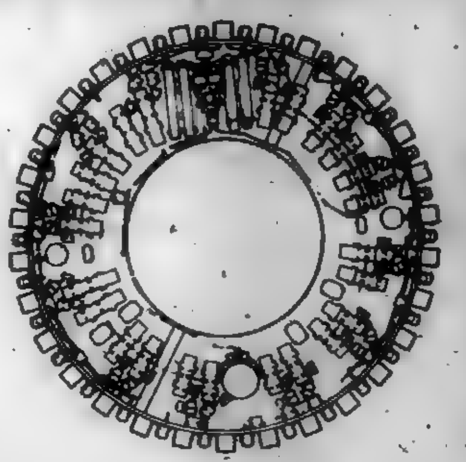
HUGHES



The last two decades have been the most productive and exciting periods in American communications technology. Since its inception in 1979, Hughes Communications has been a pioneering force in tailoring new satellite technology to meet rapidly changing communications needs.

We began by approaching the industry in terms of its needs, not ours. We talked with industry leaders about their specific concerns and objectives. Then we combined the best in technical, regulatory, and business arrangements to provide them with the most effective communications service possible.

Our innovative approach in selling the transponders on Galaxy I (the cable shopping center) benefits both cable programmers and cable operators. We have also designed the Galaxy II and III satellites to serve the specialized communications needs of the business community. Our Galaxy system now includes not only our space segment but also an entire terrestrial communications system made up of microwave and earth station facilities in various strategic locations.

LEASAT is another example of our unique approach to the communications business. We lease service on our LEASAT satellites to provide worldwide tactical communications for the Department of Defense.

Through all these programs, we are aware that the ability to process and transfer information is a key ingredient in the critical planning of many industries and government agencies. We are investing over a half billion dollars in our satellite and ground communications facilities. We are committed to serving the right needs at the right time.

If you're ready for the challenging opportunities in the satellite communications industry, we offer unparalleled careers. On earth or beyond.

Current openings:

- **Satellite Controllers**
- **Earth Station Technician**
- **Microwave Systems Engineer**
- **Orbital Analyst**
- **Satellite Communications Engineer**
- **Telecommunications Systems Engineer**

Send your resume to:

Janet Erceg, Employment Dept. WC-8A,
Hughes Communications, Inc.,

MIS PROFESSIONALS

Atlanta Location

At Hayes Microcomputer Products, Inc. there's an energy level that fuels our confidence. An enthusiasm that is not only encouraged but supported. We are the nation's ninth fastest growing privately-held company and a world leader in the design and manufacture of communications peripheral equipment. Our ongoing expansion has created career opportunities for the following MIS professionals.

MANUFACTURING SYSTEMS ANALYSTS: Experience with MRP II, inventory management, production control, and master production scheduling systems development and implementation.

FINANCIAL SYSTEMS ANALYSTS: Experience in general ledger, accounts payable and order processing and billing systems development and implementation.

Both of the above positions require a degree in Computer Science, Business Administration or a related field. Two plus years experience in both business and computer systems development, including experience in programming supervision and/or technical design activities essential. Should have training and experience in the use of IBM 43XX or 308X hardware/software including CICS, MVS, IDMS, TSO, COBOL, and ADSO.

SYSTEMS PROGRAMMER: Bachelor's degree in Computer Science or Mathematics necessary. 3-5 years of previous experience as a systems programmer in an IBM, OS (MVS), JES 2 environment including operating system generation and TSO is required. Experience in IDMS and CICS is desirable. Previous programming experience using BAL and COBOL is also desirable. An understanding of IBM 43XX/308X hardware systems architecture and familiarity with SNA/VTAM data communications design concepts and advanced coding techniques is highly advantageous.

COMPUTER OPERATIONS MANAGER: Will be responsible for maintenance and operation of Burroughs 1955, VAX 11/785 and IBM 4381. Must have BS in Computer Science, related field or equivalent experience. Four plus years experience in computer operations with at least 2 years in a supervisory role required. Working knowledge of IBM 43XX or IBM 308X hardware/software including OS/MVS, JES 2, CICS, IDMS, VTAM, and NCP. VAX experience should include knowledge of VMS, DCL and DECNET.

Here at Hayes we are committed to the development of information systems that will provide the competitive edge. We offer an exceptional compensation package that includes an employee stock ownership plan. Our location in Atlanta offers diverse cultural events and a myriad of recreational activities. Qualified candidates should send confidential resume including salary history and requirements to: HAYES MICROCOMPUTER PRODUCTS, INC., Dept. 78-268, PO Box 105203, Atlanta, GA 30348. An Equal Opportunity Employer M/F.

The Mind to Imagine
THE SKILL TO DO

Motorola's Government Electronics Group — a world leader in electronics, renowned for quality and productivity through employee participation in management — has the following opportunities for data processing professionals.

MIS Manager

This challenging position requires an individual with extensive knowledge and 8-10 years experience in a large IBM/AMDAHL (308X 5870) environment. Critical skills include structured Design Methodology, project management tools and techniques for designing business oriented computer systems in general and in detail. A demonstrated successful track record in managing systems development projects, complimented by strong communication skills and a creative approach to problem solving are necessary.

Manufacturing Systems Planner/CIM Coordinator

We are seeking an individual with senior level experience in a manufacturing environment. Responsibilities will include strategic and tactical planning systems. Position requires superior communication skills, including presentation ability. The successful candidate must have good people skills, and be self-motivated with the ability to deal with complex business issues. Experience in a distributed processing environment, with IBM based architecture and/or a government contractor environment is a plus. A degree in business, computer science or a related field is desirable.

Manufacturing/Financial Business Analysts

Excellent user communication skills and experience with Manufacturing or Financial applications are essential for these positions. Primary responsibility includes identification of business problems and providing workable solutions. Strong financial skills with understanding of Data Processing are required. Prefer a degree with 3 years experience.

Join the professionals of Motorola's Government Electronics Group. The benefits are many. Qualified applicants are invited to send resume or call Tony Benavidez at (602) 949-3759.

COMPUTER PROFESSIONALS

Information Technology Services (ITS) at Rensselaer Polytechnic Institute, located in Troy, New York, provides a variety of computing services in support of instructional and research activities. The Voorhees Computing Center serves the university community with an IBM 3081D running the Michigan Terminal System (MTS) in Extended Architecture Mode in a distributed environment of terminals, personal computers, and related network and communications services. The Academic Services Group provides consulting services to the computing community in the areas of data base management, engineering applications, graphics, numerical programming, statistical computing, and text processing. We are seeking talented individuals with strong technical skills to fill the following positions:

General Consultant/Applications Programmer: serves the user community of faculty, students, staff, and external users by consulting on the availability and use of applications development software, languages, and compilers. This person installs and supports compilers and applications software, and teaches short courses on the user interface to the operating system (Editor and File Structure) and other topics pertinent to our computing environment.

Experience with SPIRES (Stanford Public Information Retrieval System), Cobol, PL/1, PASCAL, C, and familiarity with OS/VS, CMS, MVS, MTS, UNIX, IMS, DL/1 and consulting experience are highly desirable. Expertise in Fortran or Assembler, and strong interpersonal skills are mandatory.

A Bachelors degree is required and an advanced degree and teaching experience are highly desirable.

Statistical Computing Consultant: assists and advises students, faculty, staff, and external users in selecting and using software and interpreting results in statistical applications. The schools of Engineering, Science, Management, and Humanities and the Social Sciences represent the largest client base. The consultant will also teach short courses on the use of applications software. Other responsibilities include the surveying, installation, and documentation of new applications software for both the IBM 3081D mainframe and microcomputers, as well as the maintenance of existing software on the system. Opportunities for participation in university research projects may be available.

At least an M.S. in statistics (or related field) is required and a Ph.D. is desirable. University teaching experience and strengths in other areas of computational mathematics (numerical analysis, operations research) are highly desirable. A thorough knowledge of several statistical packages (e.g., SAS, SPSSx, BMDP) and Fortran is important. Adaptability and an interest in learning new techniques and packages is essential.

ITS also provides operating systems programming support for an IBM 4341 based service under VM/CMS and the IBM 3081D using Michigan Terminal System under XA. The systems programming group currently consists of five full time programmers. Programming duties include MTS development and maintenance and support for the VM/CMS installation. We are seeking experienced programmers with the following qualifications:

IBM 370 Systems Programmer: Familiarity with IBM 370 architecture as well as 370 assembly language is required. At least 2 years of professional, full time programming experience is required. CMS experience is desirable. A Bachelors degree is preferred.

For immediate consideration, qualified candidates should submit resumes, three professional references, and salary requirements by September 12, 1985.

RPI is an Equal Opportunity/Affirmative Action Employer.

McCain, Search Masters, [illegible] Dr., Rochester, NY [illegible], (716) [illegible].

Software talent and technology coming together in one place.

Lockheed brought their expertise to Austin in 1982 and devoted it to advancing various applications of software technology. With this commitment, they have developed their own Software Technology Center and are a member of the Microelectronics and Computer Technology Corporation (MCC). Computer scientists are researching and developing the application and integration of software into a variety of Lockheed Corporation programs. Everything from the Precision Location Strike System to the development of expert systems that have the ability to analyze and solve problems through the practice of Artificial Intelligence.

The following positions are for software specialists who want to see their work applied to state-of-the-art hardware:

Artificial Intelligence Specialists

Your experience in Artificial Intelligence applications includes building and developing Tactical Military Expert Systems using LISP, OPS5, ART, Symbolics or VAX 11/780. You have a degree or an advanced degree in Computer Science/Engineering.

Advanced Systems Engineers

Your background includes C³I, automated intelligence processing, tactical C³ simulation, expert systems or knowledge engineering. A degree in engineering, math, science or computer science is required.

Systems Analysts

You're a hardware/software generalist. Your experience is in developing broad capabilities in systems that include mini/microcomputers, real-time processing, tactical intelligence and C³ applications. Knowledge of military specifications and controls will be considered a plus.

Software Specialists

You'll be designing and developing applications, systems, and data communications. Knowledge of Ada, graphics display, C³I and MIL-SPEC standards is desired.

Operating Systems Specialists

You're a degreed software engineer. Good writing skills are required to tailor I/O handlers, implement memory-resident DBMS and deal with specialized communications design for Rolm Hawk, Data General MV 1000, Intel 8086 or VAX 11/780 processors. Additional experience in radar target acquisition and track correlation is desired.

Lockheed and Austin offer the best of both worlds. Recreational advantages as diverse as the professional opportunities. We're a division of a Fortune 50 company and have the resources you'll need to advance your career and the state of software technology. Send your resume to: Professional Employment, Dept. 653-16, P.O. Box 17100, Austin, TX 78760. Lockheed is an equal opportunity, affirmative action employer. U.S. citizenship is required.

Lockheed-Austin

Giving shape to imagination.

DIRECTOR
MANAGEMENT INFORMATION SYSTEMS

The Computing and Information Technology office at the University of Missouri is seeking a Director of the Management Information Systems. Responsibilities include the direction and management of Business Systems Planning, Decision Support Services, Data Base Administration and university wide Business, Financial and Student Informations Systems development and maintenance for a four campus system. Total staff approximately 25 persons.

Candidates should have a thorough understanding and appreciation of the broad mission of a large public land-grant university and the importance and role of computing in support of that mission. Candidates should have a demonstrated ability to plan, design and implement integrated information systems and management services to meet the needs of a diverse user community. The position reports directly to the Director of Computing and Information Technology.

A Master's degree in Business Administration or Computer Science and/or equivalent combination of education and experience is necessary. Five to seven years of management experience in computing systems design and development is required. Salary will be competitive, based on qualifications and experience.

Location is in Columbia, Missouri which is in a centralized location between Kansas City and St. Louis and near the Ozark recreation area.

Please submit letter of application and resume by September 30, 1985 to:

University of Missouri
Personnel Services

SOFTWARE PROFESSIONALS

Looking For A State-Of-The-Art Environment?
H&M Systems Software Is Looking For You!

SALESPEOPLE:

If you're a successful, highly motivated software salesperson currently selling to the IBM mainframe market, or an ambitious individual with a strong background in PROGRAMMING, SALES, or COMPUTER SCIENCE. H & M SYSTEMS SOFTWARE, INC., a leader in CICS systems software, would like to introduce you to a state-of-the-art environment that offers career growth and opportunity to individuals interested in furthering their careers in sales. We have immediate openings available on our sales force. We seek individuals who can manage their time effectively...who are closers ...and have the following basic skills:

GOOD COMMUNICATION SKILLS
GOOD TECHNICAL BACKGROUND
GOOD APPEARANCE
PERSISTENCE

SALES SUPPORT REPS:

Because of an increase in sales, we have increased our demand for training, as well as troubleshooting, the products we sell. We would like to hear from PROGRAMMERS and SYSTEMS PROGRAMMERS. People who have knowledge of CICS and VSAM, in either a DOS or OS environment. Candidates will be required to travel within the continental US or Canada.

As our selected candidate, you will receive a competitive salary and bonus plan, a superior benefits package, a fully paid expense account, and excellent working conditions in an atmosphere that stimulates motivated individuals such as yourself to realize their potential.

If you have the qualifications we've described, please send your resume, in confidence, to our Personnel Dept. at:

(201) 845-3357

H&M

SYSTEMS SOFTWARE INC.

40 Eisenhower Drive, Paramus, NJ 07652

equal opportunity employer M/F

Why should a Systems Programmer join Central and South West?

Because CSW provides an environment where your success is guaranteed, if . . .

- You enjoy working toward not-so-common objectives in a team environment but also enjoy planning and doing your own work.
- You seek the opportunity to apply your knowledge.
- You are motivated by your own professional 'pressure' to do a job well.

Currently, opportunities are available for persons to apply **CICS** experience and for persons to apply **MVS/XA** knowledge and/or experience as we move toward XA.

- **Senior Systems Software Analyst—MVS**
  Will plan and implement MVS/XA conversion. Will also provide technical support for MVS/SP including installation, maintenance and problem determination. Could support VM and VSE.
- **System Software Analyst—MVS**
  Will assist in installation, maintenance and problem determination of MVS/SP. Will assist in conversion activity for MVS/XA.
- **Senior System Software Analyst—CICS**
  Will provide primary support for planning and implementing CICS and evaluating system performance. Will direct and monitor the work of others.

Our environment includes Amdahl 470 V8's and 580 with MVS, VM, VSE, JES2, TSO/ISPF, ACF2, MSI, CICS, SMP, DPF and ROSCOE.

For immediate consideration, please send your resume and salary requirements to the Employee Relations Department. Principals only.

Central and South West Corporation
P.O. Box 220164 • Dallas, Texas 75222

Central and South West Corporation is one of the nation's leading electric utility systems, having annual revenues of more than $2 billion. With corporate headquarters in Dallas, CSW serves more than four million people through its operating companies in Texas, Oklahoma, Arkansas and Louisiana.

Equal Opportunity Employer

Manufacturing and Manufacturing Accounting Applications, Marketing and Technical Personnel

IBM Systems /34/36/38

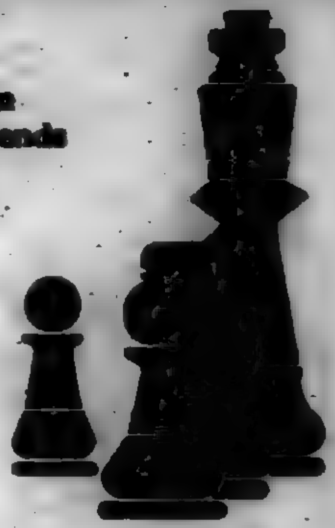
FRBSF

Whether you win or lose . . . depends on the moves you make . . .



The opening moves in a game of chess predetermine the outcome of the entire game. If you are wise the right moves can lead to an easy win. If you are unwise the wrong moves can lead to a painful loss.

In many ways the same is true of your computer career. After two or three years of experience you are ready to make the opening moves in your career advancement. But; just as in chess, you need a great deal of experience to know which moves are the best for you . . . and you don't have the necessary expertise required.

But we do! That's why you really need NCA. We can show you more, completely detailed, career opportunities, both locally and nationally, than you are likely to find elsewhere. Furthermore, our long association with employers has given us the inside information that is needed to help you to determine your best career moves.

All of our specialized services don't cost you one cent because employers pay our fees. So, if you're ready to make your opening career moves, you'll make them most wisely by: coming in, calling or mailing your resume to the NCA firm nearest to you.

Exceptional Lifestyle...

A Creative Adventure for a Senior Programmer/Analyst

The startling Berkshires just naturally lend themselves to a quality of life that is an unparalleled pleasure. Of course, you know that . . . you vacation here, why not live here? The housing is affordable but in addition we are just a few minutes away from such recreational pleasures as skiing, hiking, boating, fishing and just plain enjoyment. The scenery is unsurpassed; the flavor of lifestyle is straight from the brush of Norman Rockwell. Besides, all of this is augmented by the exciting job opportunity we are prepared to extend to a special Senior Programmer/Analyst.

As Senior Programmer/Analyst you will have autonomy to develop a completely new software application. We are installing an IBM System/38 model 20, the entire application of which will be developed by our carefully selected candidate. You will work with all levels of our staff in a team-oriented environment. You must, of course, be a hands-on professional who demonstrates heavy involvement with manufacturing systems applications.

In order to qualify, we require that you have at least 5 years program experience with a minimum of 2 years on S/38. Excellent verbal skills are essential in our team environment. Although we prefer a college degree, we value your experience and management ability to an even greater degree. If you feel you are the right person for us, please send your resume stating your salary requirements to the attention of Scott Hollander.

Get your money's worth. Computerworld will lower your cost-per-hire.

When you're looking to fill MIS/DP positions, there's really only one place you need to advertise. Computerworld.

In every major market, Computerworld reaches more data-processing professionals than the local recruitment media. And we reach them for less.

Over 600,000 computer-involved professionals receive Computerworld every week. That's more than any other computer trade journal, business publication, or general-interest magazine.

Computerworld delivers quality readership, too. Fully 41% of our subscribers read Computerworld's recruitment section every week. And 95% of our subscribers read this section regularly.

That's why over 4,000 organizations ran more than 6,500 recruitment ads in Computerworld in 1984. The openings they advertised for cover the whole gamut of MIS/DP positions – including systems analysts, computer science & software engineers, directors of MIS/DP, programmers, sales managers, and systems managers.

As a matter of fact, recruitment advertising has made Computerworld the national leader in classified advertising among specialized business publications (according to *Business Marketing* magazine).

Compare costs and the people reached. You'll find that Computerworld is the number one medium for computer-related recruitment advertising.

Find out how we can lower your cost-per-hire. Get your copy of our "1985 Quick Reference Rate Card." Call toll-free (800) 343-6474. In Massachusetts call (617) 879-0700. Call now. We'll help you find the people you need.

DEPARTMENT OF INFORMATION TECHNOLOGY
COMMONWEALTH OF VIRGINIA

COMPUTER SYSTEMS CHIEF ENGINEER

This individual serves as Technical Software Manager supervising a staff of system programmers in the installation and support of centralized and distributed VM Operating System Software. Emphasis is Office Automation software in an IBM based multi-customer environment.

Strong managerial and technical experience in support of distributed systems is required. Experience in VM/CMS, PROFS, DISOSS and other OA software along with experience in IBM 4300, Hewlett Packard, and Wang hardware is highly desirable. Additional experience with other OA and DDP systems as well as experience in MVS is also desirable.

Applicants must have strong oral and written communication skills, project planning and management skills, supervisory skills, and a broad base of technical experience in software and hardware installation and maintenance. Individual will supervise and coordinate software support activities with customer plans and requirements for DDP and OA requirements.

DIRECTOR

CENTRAL COMPUTING FACILITY

The Computing and Information Technology office at the University of Missouri is seeking a Director of the Central Computing Facility. This office is looking for an individual with experience in managing a large computing facility. The UM Computing Facility is the centralized node of a 4 campus and hospital distributed network. The position requires good management skills, a familiarity with instructional and research use of computers and one who can provide leadership and innovative approaches in a complex environment. The present environment is composed of an IBM 3081D, Amdahl V7 and V8 running VM/MVS operating systems and supporting TSO, CICS and CMS.

Direct management responsibilities include computing operations, customer support services and systems programming with a total staff of about 80. The position reports directly to the Director of Computing and Information Technology. A Master's degree in Computer Science, Business Administration or Engineering, and/or equivalent combination of education and experience, is necessary. Five to seven years of computing management experience is required. Salary will be competitive, based on qualifications and experience.

Location is in Columbia, Missouri which is in a centralized location between Kansas City and St. Louis and near the Ozark recreation area.

Please submit letter of application and resume by September 30, 1985 to:

The above information is intended as a guideline for computer users on relative computer system instruction cycle times. All data have been derived from published documentation and represent reasonable estimates of average MIPS ratings. However, Randolph is not responsible for the accuracy of the MIPS data. Cycle times will vary based on hardware/software configurations, and system manufacturers continually modify computer models as design improvements in hardware and software arise.

TALK TO RANDOLPH NOW. Whatever your computer system needs, Randolph can deliver the hardware when you need it...and ease the pressure on your DP budget with low lease rates. Call William Rooney, Vice President, 800-243-5307, in CT (203) 661-4200.

CLASSIFIED ADVERTISING ORDER FORM

Computerworld's Classifieds work.

Issue Date: Ad closing is every Friday, 10 days prior to issue date.

Sections: Please be sure to specify the section you want: Time and Services, Software for Sale, Position Announcements and Buy/Sell/Swap (Available upon request: Software Wanted, Real Estate, and others).

Copy: We'll typeset your ad at no extra charge. Please attach CLEAN typewritten copy. Figure about 25 words to a column inch, not including headlines. Any special artwork should be enclosed with your ad also. Logos must be submitted on white bond paper for best reproduction.

Cost: Our rates are $144.90 per column inch. (Each column is 1 13/16") Minimum size is two column inches (1 13/16" wide by 2" deep) and costs $289.80 per insertion. Extra space is available in half-inch increments and costs $72.45. Box numbers are $15.00 extra per insertion.

Billing: If you're a first-time advertiser, (or if you have not established an account with us) WE MUST HAVE YOUR PAYMENT IN ADVANCE, or a Purchase Order Number. Any extensions on this policy must be made through our Credit Department.

ORDER FORM
COMPUTERWORLD BULLETIN BOARD

Issue Date: Ads can be accepted up until the Monday preceding the issue desired. Computerworld comes out every Monday. The Bulletin Board is only for the buying and selling of computer equipment.

Classifications: Most ads will be classified according to the brand of equipment that is being bought or sold. These classifications include Basic Four, Burroughs, Control Data, Disk Drives and Tapes, Amdahl, Prime, Modems, Perkin Elmer, Printers, TI, Tapes, Wang, Qantel, Desk Top Computers, Data General, Digital/DEC, Hewlett Packard, Honeywell, IBM, NCR, Sperry Univac, Salvage, Terminals, Misc. Systems and Miscellaneous.

Copy: Copy sent in via the mail or telecopier (telecopier extensions are 410 and 451) should be cleanly typewritten. Ads must be given over the phone to our team of ad takers, or sent in writing, no camera ready material will be accepted. The standard size is 1 column by 1 inch deep. These units may be combined to form larger size ads. No borders or logos are allowed. You may not have several different types of equipment listed, i.e. DEC, Honeywell, IBM.

Cost: The price for each standard unit is $140.00 (One unit minimum and no fractional units allowed.) There are no agency commisions or quantity discounts.

Billing: Once you've written your ad, send (or call) it in with your name and address for billing purposes and we'll run it. (If your company has never advertised with us before, we request a check with your order.)

The Bulletin Board

Our Low-Cost Way to Sell Your Equipment in Computerworld

What is The Bulletin Board?

We have a classified section designed to help you buy or sell individual software and hardware. It's especially suited to companies with a piece of used equipment for sale. For one low price, you can advertise to over half a million Computerworld readers nationwide.

How Does The Bulletin Board Work?

- The Bulletin Board is designed to advertise only one piece of equipment or software per unit.
- Units are one column wide by one inch deep at a cost of $140.00 per column inch. Although several units may be purchased for one advertisement, there will be no quantity discount.
- All ads are standard in format and typeface. No special typeface, borders or logos are allowed. Copy may be up to 25 words per unit.
- The Bulletin Board ads are listed by manufacturer or by product type under appropriate headlines.
- Ads are set on a six-column page in our classified section under "The Bulletin Board".

How to Place an Ad in the Bulletin Board:

- We suggest you prepare your ad before contacting us. Here are some guidelines:
  The first line is set in larger, bold type and should contain standard equipment identification.
  The body copy should describe the equipment and state the price.
  The closing should supply the seller's name and telephone number.
  This is all the information an interested buyer needs for follow up.
- Ads are accepted by mail, phone or by telecopier.
- Deadline is 7 days in advance of Monday issue.
- If you have never advertised with Computerworld, we request a check with your order.
- The Bulletin Board ads are not agency commissionable nor may they be applied to contract advertisers inch count.
- We assume no liability for errors beyond the price of the ad.

Here's the Address and Phone.

CLASSIFIED ADVERTISING ORDER FORM

Computerworld's Classifieds work.

Issue Date: Ad closing is every Friday, 10 days prior to issue date.

Sections: Please be sure to specify the section you want: Time and Services, Software for Sale, Position Announcements and Buy/Sell/Swap. (Available upon request: Software Wanted, Real Estate, and others).

Copy: We'll typeset your ad at no extra charge. Please attach CLEAN typewritten copy. Figure about 25 words to a column inch, not including headlines. Any special artwork should be enclosed with your ad also. Logos must be submitted on white bond paper for best reproduction.

Cost: Our rates are $144.90 per column inch. (Each column is 1 13/16") Minimum size is two column inches (1 13/16" wide by 2" deep) and costs $289.80 per insertion. Extra space is available in half-inch increments and costs $72.45. Box numbers are $15.00 extra per insertion.

Billing: If you're a first-time advertiser, (or if you have not established an account with us.) WE MUST HAVE YOUR PAYMENT IN ADVANCE, or a Purchase Order Number. Any extensions on this policy must be made through our Credit Department.

INTRODUCE YOUR DATABASE TO INTELLIGENCE OF A HIGHER ORDER.

The intelligence we speak of isn't science fiction. It's science fact.

In fact, it's INFORMATION EXPERT.™ from Management Science America, Inc. The fourth generation technology that not only recognizes the limitations of database vendors but addresses them.

For example, Information Expert allows all your software systems to work in a completely new manner. Together. Whether it's with existing software or new software.

And whether you're an end user designing reports or a data processor using its fourth generation language for applications development, Information Expert is expert at both. What's more, there's even a data dictionary that helps you do in minutes what used to take you hours. Our system also allows borderless retrieval of information. So you can get all the information you need. Not all the information you don't need.

So if you want more intelligent software, go to a more intelligent software company. MSA. For more information, call Robert Carpenter at 1-404-239-2000.

Trade bans anger users in S. Africa

DP community fears halt in U.S. computer imports

By John Desmond

The South African community of computer users is fortifying itself for a restriction on the sale of computer hardware and software from the U.S.

This was the consensus gathered from a series of telephone interviews with South African computer users, vendors and observers conducted by *Computerworld* last week.

The U.S. Congress is considering legislation that would ban the sale of computer hardware, software and services to agencies of the South African government that administer apartheid, the policy of racial separation. A vote on the legislation is expected in the U.S. Senate this week.

"Any kind of restrictive or punitive action would be a great disappointment," said Jack van Nunen, DP manager at a Johannesburg insurance company and spokesman for the 220-member Computer Users Council of South Africa.

John Millin, Amdahl Corp.'s manager in South Africa, added, "The action by the U.S. government is just helping to kill U.S.-based companies in South Africa. There will always be vendors prepared to supply equivalent equipment. The U.S. government can't apply its rules to the rest of the world. [The ones that] will suffer are the U.S. corporations [that] are trying to influence the government here to make reforms."

The impact of the restrictions, if passed, would depend on the pressure the U.S. puts on the Japanese and European governments not to sell computer technology to affected agencies of the South African government, Millin said.

The bill being considered by Congress, the Anti-Apartheid Act of 1985, would prevent the sale of computers to the South African military, police, prison system, national security agencies and the Department of Cooperation and Development, which administers the affairs of blacks in the townships [CW, June 17].

The bill would not essentially change restrictions that have been in place since 1978, when President Carter restricted the sale of computer equipment to all the above-named agencies of the South African government. Those restrictions are being honored by U.S. companies, several sources said.

However, approval of the bill by Congress and President Reagan would make South African users more reluctant to do business with U.S. companies, according to Miss van Vuuren, general manager for Burroughs Corp. in South Africa.

"Most South African customers would consider it risky to do business with U.S. suppliers because the embargo might be

AT&T, Sun to redo Unix

By John Desmond

AT&T and Mountain View, Calif.-based Sun Microsystems, Inc. said last week that they are working together on a convergence of AT&T's Unix System V with Sun's University of California at Berkeley Unix 4.2-based operating system.

Unix System V is currently an industry standard for commercial users, while Berkeley Unix 4.2 is used widely in the academic and scientific communities.

According to Bill Joy, vice-president of research and development at Sun and a principal designer of Berkeley Unix 4.2, "This is a significant step toward unifying the Unix system license community around a single standard. The joint AT&T and Sun effort will work on evolving the System V standard to accommodate the services offered by [Berkeley 4.2]."

The converged system will continue to run System V applications and will provide advanced networking services that have previously only been available in

Debuts link firm's line of software

Martin Marietta offerings further its master plan

By John Gallant

NEW YORK — Martin Marietta Data Systems last week introduced the first offerings in a projected product line designed to tie together the company's disparate software systems.

The announcement is the latest move in Martin Marietta's two-pronged strategy of internal development and aggressive acquisition, through which the Greenbelt, Md.-based company is becoming one of the largest players in the software industry.

At last week's press conference, held at the trophy-stuffed Explorer's Club in midtown Manhattan, Martin Marietta introduced an on-line applications development facility that allows users to build systems with either a Cobol-based tool, a fourth-generation language or a menu-driven generator.

The company also unveiled IBM Personal Computer-based integrated workstation software that offers micro-to-mainframe communications capabilities, an as-yet-incomplete implementation of its mainframe-based fourth-generation language and gateways to a variety of mainframe data storage systems.

The Consensus applications development system and Unison workstation software are the initial fruits of Martin Marietta's fledgling Natural Selection series of software. Two additional Natural Selection series announcements will be made later this year, Martin Marietta spokesmen said.

PROFILE

King without a kingdom

By Edward Warner

Picture the data processing manager of a multinational corporation, and you imagine a person in command of rows of mainframes and a staff of hundreds.

Not at United Technologies Corp.

The data processing manager of this $9.9 billion international conglomerate, ranked 16th among the Fortune 500, presides over a lone minicomputer and a staff averaging 15 people.

United Technologies prefers to let each of its major subsidiaries do its own data processing with only limited oversight from corporate headquarters. As a result, though John Bennett carries the lofty title of United Technologies data processing director, he is a king without a kingdom.

While policy statements with corporatewide impact do come from the firm's headquarters in Hartford, Conn., decisions concerned with data processing are often produced by committees of DP managers and analysts drawn from the various subsidiaries. Bennett said in a recent interview that his responsibility to those committees and to United Technologies' DP managers in general "is to ensure that everybody knows everybody and that everybody knows what everybody is doing."

As the man responsible for setting United Technologies' companywide DP standards, Bennett does issue a few proclamations of his own. A recent mandate,

Datapoint head offers buy-out

By Peter Bartolik

Asher B. Edelman's plans to exercise his control of Datapoint Corp. took yet another dramatic and controversial turn last week when he presented a plan to take the company private in a leveraged buy-out.

The San Antonio-based company said Wednesday that Edelman, who is chairman of the board, offered a plan to pay shareholders — other than the members of the buy-out group — $6 per share, for a total value of about $100 million, and take the company private.

In another development the same day, Datapoint's spin-off service division, Intelogic Trace, Inc., said it rejected a $177 million buy-out offer made by TRW, Inc.

Intelogic Trace, of which Edelman is also the chairman, reported the termination of discussions to acquire the service arm of Mohawk Data Sciences Corp., a firm in which Edelman owns stock and that he has previously sought to liquidate.

In a phone interview with *Computerworld*, Edelman said he thinks customers will be encouraged by his bid. "I think in general the customer base, many of whom I've seen in the last few months, will understand there is a commitment both on my part and on management's part to stay in this company and continue to build it; we will be the owners," he said.

Analysts reacted negatively, speculating Edelman would seek to milk Datapoint's assets to recoup his investment and then sell the company as he has done with others. But Edelman pointed out that the first company he bought into is still active, and he serves as its vice-chairman. His strategy varies "according to the company — [at Datapoint] when I got into it I said I wanted to stay there; I've stayed there, I've worked hard, I've visited customers."

Edelman's bid to take Datapoint private marks another departure from his original intent to duplicate the control, divide and sell strategy that worked when he gained control of Management Assistance, Inc. in August 1984 and sold off its operating divisions.

He then turned his eye first to Mohawk Data and then to Datapoint, using the same strategy of acquiring minority interests and presenting well-publicized plans to liquidate the firms.

After gaining the chairmanship and control of half the board of directors of Datapoint in March, Edelman said he was looking to sell the service division for $200 million and the manufacturing division for $100 million. He soon changed direction, however, and said he would continue to operate the manufacturing division, and the service division was spun off as a separate company owned by the shareholders of Datapoint.

Intelogic Trace then said it would acquire the service arm of Mohawk Data for $80 million and loan Mohawk $20 million; that was a controversial plan that analysts interpreted as an attempt to bail out Edelman's 8% holding in Mohawk Data.

Edelman last week presented Datapoint with his plan to take the company private, saying he and some of his affiliates, together with Datapoint board member Charles P. Stevenson Jr. and certain other members of the board and management of the company, would form a corporation with which to merge Datapoint.

Company spokesman Jack Milne told *Computerworld* that all of the other members of the buy-out team have not been identified "but certainly will include the key individuals."

Datapoint said the proposal is dependent upon the ability of the Edelman group to obtain financing and a favorable recommendation of an investment firm. After those conditions are met, the proposal would be subject to a majority vote of shareholders.

Intelogic Trace, in announcing its rejection of TRW's offer of $9.50 per share, said it would offer instead an exchange of securities for up to four million of its 17 million outstanding shares for those shareholders who want to cash in their investment.

ADR INVENTED MIGRATION SOFTWARE SO YOUR COMPANY CAN MOVE AHEAD WITHOUT FALLING HOPELESSLY BEHIND.

"Next time Bigelow, look before you quantum leap!"

If your company is growing, you've probably realized your old data base management system (DBMS) just can't do all the things you need it to do. It takes too long to write programs, it won't give you the information management needs and it's nearly impossible for end-users to figure out how to use. So it's time you moved to a new DBMS.

But conversion is like trying to change a tire on a moving car. It requires that you practically rebuild your entire data processing system from scratch and maintain your existing services while doing so. And the applications backlog, the very thing you hoped this new technology would reduce, ends up growing bigger in the process.

That's why we invented Migration Software—software that automates the awesome conversion process.

With the new ADR/DL1 TRANSPARENCY™ and the ADR/VSAM TRANSPARENCY™ you can migrate from your existing DBMS to our high performance relational DBMS, ADR/DATACOM/DB®, and your existing applications will run exactly as they did before. Without modification. At last, you can convert without having to rewrite all your applications.

ADR Migration Software also reformats your existing data. Automatically. And the ADR/DL1 TRANSPARENCY even designs your new data base. So the conversion is quick, cost efficient and virtually error free.

And now programmers can use powerful 4th generation productivity tools like ADR/IDEAL®, relational query languages like ADR/DATAQUERY®, and decision support systems like ADR/EMPIRE®. And even end-users have easy access to mainframe data through their own personal computers, using ADR/PC DATACOM®.

If you're ready to move up to the new relational technology, mail us the coupon. Or call 1-800-ADR-WARE and we'll show you how your company can grow without the growing pains of conversion.

ADR® WE KEEP WRITING THE HISTORY OF SOFTWARE

STC enhances storage tool

By James Connolly

LOUISVILLE, Colo. — The company that claims 90% of the market share for IBM mainframe-oriented, solid-state storage equipment, Storage Technology Corp., has announced enhancements for its 4305 Optimizer Storage Subsystem.

The 4305E Optimizer has four times the storage capacity and twice the number of channels as the existing 4305 Optimizer, according to the announcement made last week. The enhanced system features a capacity of 768M bytes and a maximum of eight channels for connection to up to eight host computers.

"The computer views a solid-state system as a disk drive, except it is faster. The kind of data this product is aimed at is in the ultra-high-performance data sets, of which there are maybe 45 or 50 in a typical IBM system," said Fred Moore, manager of worldwide product marketing for STC.

The product reportedly is intended for use in IBM VM systems handling paging and swapping and is used increasingly for data files with high transaction rates. The latter applications, according to STC, include IBM IMS and CICS load libraries, data base indexes, master catalogs and computer-aided design and manufacturing roll files.

Moore said that STC is offering field upgrades for the 5,500 4305 Optimizers installed since the product was announced in 1979. He said STC has sold more than 90% of the solid-state subsystems installed in IBM and compatible mainframe systems.

The 4305E Optimizer uses 256K-byte random-access memory (RAM) chips rather than the 64K-byte RAM chips used in the earlier, 192M-byte version. Memory expansion is through modules of 12M, 24M, 48M and 96M bytes, according to Moore.

The additional channels may be added through use of a four-channel switch, which allows each director in the 4305E Optimizer to be attached to four channels rather than the two channels previously permitted. Each subsystem can have one or two directors, according to STC. The host connections are provided via block multiplex channels supporting 1M, 1.5M and 3M byte/sec. data transfer rates.

The 4305E Optimizer was designed to emulate an IBM 3380 disk drive or an IBM 2305 fixed-head drum device. Moore said the access time for the solid-state system is 0.3 msec, compared with 16 msec for a disk drive.

A single-director, 12M-byte 4305E Optimizer costs $69,100. A two-director, dual-port, 768M-byte configuration costs $1.33 million. For existing equipment in the maximum configuration, an increase from a two-channel switch to a four-channel switch costs $17,200, and an increase from 192M bytes of storage to 768M bytes costs $720,000, Moore said.

NAS beefs up systems

Add-ons target 6600, 9100 processor lines

By Jeffry Beeler

MOUNTAIN VIEW, Calif. — National Advanced Systems Corp. (NAS), reacting to user demand for increased systems functionality, last week added two hardware enhancements to its mid-range scalar mainframe family and two software improvements to its attached vector processor.

In the wake of NAS' Sept. 4 announcement, the company's 6600 series intermediate-scale CPUs now support IBM's High-Accuracy Arithmetic feature and the Engineering and Scientific Assist, both residing in IBM microcode.

NAS has also enhanced its 9100 vector processor through a recently signed agreement with Quantitative Technology Corp., a Beaverton, Ore.-based software and services supplier. The accord paves the way for the 9100 to support Quantitative Technology's Math Advantage, an algorithm library that helps develop scientific and engineering applications.

In a related development, NAS has further enhanced the 9100 through an agreement with a second business partner — Pacific Sierra Research Corp., developers of the Vector Array Syntax Translator (Vast), which "vectorizes" scalar program code. The contract gives NAS' attached supercomputer access to Pacific Sierra's latest enhancements to Vast.

In addition to streamlining Vast's code and thus speeding its operation, Pacific Sierra has revised the product to support complex numbers and to execute the First-Order Iteration instruction, according to Claude Steinmayer, NAS' manager of scientific marketing.

"The 9100's hardware has always had the ability to support First-Order Iteration, but until Vast was enhanced, [the machine] lacked the software to take advantage of that instruction," Steinmayer said.

Like Vast, Math Advantage is optimized for image and signal processing, seismic analysis, mechanical design and other number-crunching applications that run on systems compatible with the IBM 370 or 370 Extended Architecture.

All the latest enhancements to the 6600 and 9100 are available immediately without charge.

ITC upholds Tandon claim

By Clinton Wilder

WASHINGTON, D.C. — The U.S. International Trade Commission (ITC) last week granted temporary relief to Tandon Corp. in the disk drive vendor's fight to bar imports of Mitsubishi Electronics Corp.'s competing products into the U.S.

Affirming a May 31 ruling by federal Judge Sidney P. Harris [CW, June 10], the ITC required Mitsubishi to post a 25% bond on every double-sided floppy disk drive it sells to its U.S. subsidiary or to U.S. OEMs and end users.

If the ITC grants Tandon permanent relief in a final decision expected later this year, the total of all the posted bonds would go into the U.S. Treasury, and Mitsubishi would be banned from all sales of the named disk drives into the U.S.

Tandon has alleged that the Mitsubishi drives infringe on Tandon patents. In a companion case, Chatsworth, Calif.-based Tandon has also claimed that Mitsubishi has illegally sold the products below cost in the U.S. Harris' initial decision on that claim is expected in October.

Earlier this year, Tandon settled similar patent infringement claims against Japanese disk drive vendors Teac Corp. [CW, Aug. 26] and Sony Corp. [CW, July 15]. Rulings in Tandon's favor helped spur the Japanese companies to settle out of court and become Tandon licensees, but it is unclear whether Mitsubishi will attempt to strike a similar settlement.

"There are no such negotiations currently going on, but who knows what tomorrow may bring?" said Tandon attorney James Hamilton.

Mitsubishi attorneys could not be reached for comment.

Ethernet
TCP/IP for VAX/VMS™
Off the Shelf!
Complete package
for $8,795

Excelan offers a complete high-performance communications package including hardware, software, transceiver and all cables. Everything you need to perform high speed file transfers or do remote logins via Ethernet from a VAX running VMS or UNIX System V to UNIX 4.2 BSD machines and vice versa. Software includes TCP/IP protocols, and standard FTP (file transfer) and Telnet (virtual terminal) applications.

The entire VAX/VMS package is only $8,795, including the EXOS 204 Ethernet controller (quad-size Unibus board), EXOS 8040 TCP/IP software, EXOS 1100 transceiver and cables. And the entire UNIX System V package is only $7,295.

Excelan also offers similar packages for DEC PDPs, UNIX supermicros, and the IBM PC, XT and AT.

Sortland Yard warns against “Raffles-type sort programs.”

Call (201) 568-9700.

Ask for Inspector SyncSort!

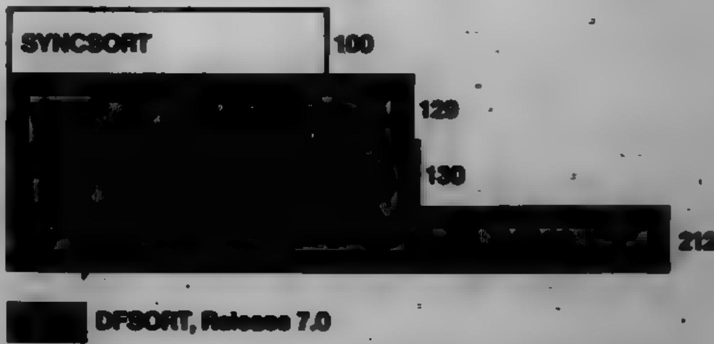
In an extraordinary move, Sortland Yard today warned data processors throughout the world to be on guard against what it termed “gentleman-bandit sort programs.”

The warning was issued by one of the Yard's best known figures, Inspector SyncSort, who has sometimes been called “a legend in his own CPU time.”

The inspector said, “One of the difficulties in apprehending these chaps is that they look so eminently respectable. They're members of a fine old hardware family. They've been to the right schools. And they invariably carry out their burglaries while wearing a dinner jacket from Saville Row.”

EXPERT COMPUTER CRACKERS. “But once the party is underway,” the inspector said, “these chaps head straight for the place where the family jewels are kept. They can crack open a computer and make off with a king's ransom in computer resources before you can say ‘Hound of the Baskervilles.’”

To indicate “the true cost of this sort of misbehavior,” the inspector released the following crime statistics:



SOMETIMES TAKE HOSTAGES. The inspector noted that these black-sheep programs often “take a dreadful toll” of programmers. “They are often tied up for days on end and forced to perform unnecessary coding, compiling and debugging. And they are heartlessly deprived of the labor-saving features that are taken for granted in most parts of the civilized sorting world.”

Among these the inspector listed:

- **SORTWRITER**
- **MULTIPLE OUTPUT**
- **RECORD EDITING**
- **FAST FILE COPY**
- **MAXSORT**

TELEPHONE BEST DEFENSE. The inspector urged data processors to call the Yard immediately if they suspect their center is infested by a Raffles-type sort program. “The number is (201) 568-9700. We'll send over one of our highly trained sort detectives to track the culprit down.”

Questioned as to what would be done with sort programs caught burglarizing computer centers, the inspector replied. “They will be given a just and speedy trial. If found guilty, they will immediately be transported to Iran!”

Debuts link Martin Marietta's software line

Borrowing from the theory of evolution, the Natural Selection theme is intended to convey the firm's goal of integrating and building on the capabilities of its existing products.

Consensus, for example, combines Martin Marietta's newly developed On-Line Programming Language, Fourth Generation (OPL4) with the UFO menu-driven application development system and its Cobol/XE development tool.

Martin Marietta obtained UFO and Cobol/XE's predecessor, UFO/Cobol, when it acquired Oxford Software Corp. in 1984. A Martin Marietta spokesman said the principal designer of UFO also headed up the development team of the OPL4 fourth-generation transaction processing language.

One beta site user of the Consensus system told *Computerworld* that while the three individual products are not yet fully integrated, he is encouraged that Martin Marietta has outlined a growth strategy for UFO and Cobol/XE, which he said are exceptional development tools.

The user said he is also pleased that the company has offered new application building capabilities — the OPL4 language — and intends to fully integrate the development systems.

In its final form, a spokesman said, Martin Marietta's Unison software will give IBM Personal Computer users the full functionality of the Ramis II fourth-generation language in addition to its other workstation capabilities. In 1983, Martin Marietta acquired Mathematica Products Group, developer of Ramis II.

According to Dan Peterson, vice-president of business development for parent company Martin Marietta Corp., the Natural Selection series is the culmination of the company's master plan, forged in 1982, to become a major software and services vendor.

In addition to the products, the company offers the MAS series of mainframe applications and the IT-Series of microcomputer software. The Natural Selection line is Martin Marietta's approach to integrating its nearly 35 member family of software products.

"Three years ago, we identified information technology, particularly the software market, as a strategic growth area for Martin Marietta," Peterson said. "In order to become a leader, we undertook our own development of products and acquired companies that were leaders in their fields.

"Our goal is to provide products and services that grow and change," he continued. "These announcements are not a break from the past but an outgrowth of our existing offerings to ensure continuing growth and success for us and our users."

Micro use sells messaging to top execs

By Bryan Wilkins

WASHINGTON, D.C. — Electronic mail messaging is pushing its way into the reaches of upper and middle-level management of U.S. business as a practical extension of microcomputer use, according to users of existing systems and vendors that sell the tools.

Typical of this trend is the experience of Citicorp, the country's largest bank, which initially set up a turnkey stand-alone messaging system five years ago. "We started out when the boss said, 'Mail is mail, whether hard copy or electronic. Put it in,' " said Richard Coughenour, Citicorp vice-president for office automation and mail systems.

However, most large U.S. corporations are still setting up internal systems and have not yet begun linking discrete networks to others or venturing outside and establishing links via public carriers, according to the speakers addressing the Electronic Mail Association here last week.

At the U.S. Department of Agriculture (USDA), a nationwide message system gradually evolved after it became necessary to keep field offices posted on late-breaking news that affected different regions.

According to Stanley Prochaska, chief of the USDA's special program division, a one-way delivery system was converted into a two-way communications network, and eventually, a two-way, region-specific information system was put into operation. "This took place over the space of a few years. Looking back, it's hard to see how we existed without it," Prochaska said.

The major benefit of electronic mail is the ability to communicate information to all parts of a company or business without the necessity of establishing voice contact.

Memorandums, letters, pricing changes on products and ordering are the functions that many of the speakers at the three-day session described as the principal uses for electronic mail.

Last year, the worldwide standards-setting body, the Consultative Committee on International Telephony and Telegraphy, published the draft version of a protocol standard, CCITT X.400, that will permit different message-handling systems to communicate if the protocol has been built into the terminal handling messages.

The CCITT X.400 standard is being supported by a number of U.S. vendors as well as by European postal authorities that are responsible for management of the message-handling systems using the public network.

However, there are still a number problems, according to Richard Miller, president of Telematics International, Inc. in Palo Alto, Calif. Miller cited one problem as the lack of certification for vendor products that claim to have implemented the CCITT X.400 standard, pointing to the problem of linking incompatible message-handling systems.

According to Coughenour of Citicorp, the success of a message-handling system depends on establishing user familiarity and comfort. "Let the users drive the enhancements that you want to add on, and be flexible, such as adding bulletin boards and other items," he said.

Martin Marietta tools aim at integrated line

corporating a newly developed fourth-generation language, Martin Marietta Data Systems' Consensus is said to give users a choice of development environments with which to build applications varying in complexity.

UFO, which currently has an installed base of some 1,700 users, allows an IBM CICS applications programmer to develop through menus all modules of an on-line system via an IBM 3270 terminal or Personal Computer/370.

Cobol/XE gives batch Cobol programmers the capability to develop on-line applications, without knowledge of the CICS transaction manager, using standard Cobol verbs and program structure.

The On-line Programming Language, Fourth Generation — known as OPL4 — facilitates modular development of on-line files, screens and programs. What a spokesman labeled "free-format syntax" and built-in functions simplify the coding of operations.

Other facilities include prototyping capabilities, an interactive debugger and a new-copy feature that allows changes to files or screens without recompiling. The language also provides a universal data access command.

The three development systems are said to be integrated with screen painting tools and active data dictionary facilities for maintenance of file descriptions and data validation rules. An optional reporting facility, based on the company's Ramis II Reporter, provides ad hoc and production reporting capabilities.

Consensus supports all standard IBM file access methods and a variety of data base management systems (DBMS), including IBM's SQL/DS, DB2 and DL/1; Cincom Systems, Inc.'s Total; and Applied Data Research, Inc.'s Datacom/DB.

It operates under OS, DOS and VM and is priced from $40,000 to $55,000. Production shipments are slated for October, according to Martin Marietta Data Systems Product Information in Princeton, N.J.

Martin Marietta's Unison workstation software is said to offer five integrated capabilities: transparent micro-to-mainframe communications; gateways to mainframe data storage systems and micro-based data; a workstation-based implementation of the Ramis II fourth-generation language; a manager that provides access to all Unison components and other micro software; and mainframe services that give users access to mainframe Ramis II.

The micro-to-mainframe communications capabilities allow users to choose a mainframe linkage method from a menu. Unison supports dial-up connection and a variety of communications boards.

Unison allows for selective extraction of data from Ramis II, IBM's DB2, IMS, SQL/DS, Vsam and Isam; Software AG's Adabas; Cincom's Total; and Cullinet Software, Inc.'s IDMS. It automatically downloads and converts data for Martin Marietta's Keepit micro software and products supporting standard micro data formats.

Unison also features an interface to IBM's Professional Office System for electronic messaging. Unison's PC/Reporter implements Ramis II reporting capabilities on the IBM Personal Computer. It offers command and menu modes and processes downloaded data or local micro files. A spokesman said the system's capabilities are currently being extended to a full-function implementation of mainframe Ramis II.

Unison's so-called mainframe services let users execute processing on the mainframe or the micro. Requests to be executed on the mainframe can be generated with a micro editor or with PC/Reporter menus, according to the vendor.

Early versions of Unison are being shipped in October, although production shipments are not scheduled until December. Pricing begins at $795.

— John Gallant

■

Consensus user calls for integration ties

Although one early user of Martin Marietta Data Systems' Consensus applications development system said the product's components more closely resemble stand-alone systems than an integrated development environment, he praised the company's efforts to tie the tools together.

Jerry Tarter, data processing manager for American Business Products, Inc., said his Atlanta-based firm has used the UFO component of Consensus for several years and the Cobol/XE — formerly Oxford Software Corp.'s UFO/Cobol — portion for nearly a year. Tarter said American Business Products, a holding company for several firms that manufacture business forms, only recently installed the OPL4 component and has not yet put that system into production use.

The company runs the products under IBM's DOS/VSE on a 4381, which supports an applications development staff composed of 10 people. Currently, he said, the Consensus components are not fully integrated.

"We are beta testing OPL4 now," Tarter said. "Both UFO and Cobol/XE are outstanding products. But my view is that all three are stand-alone products now, even though they are under one name.

"Martin Marietta's major drive is to tie them all together through a screen painter, data dictionary and report writer common to all the products," he continued. "We are very enthused about that strategy."

DP manager Bennett: King without a kingdom

issued in the interest of greater data security, required encryption of all transmitted data. But, he hastened to elaborate, these standards still leave the operating units with considerable freedom.

Such independence can create a maverick or two. Though the firm has been decentralizing data processing since 1971 — even to the point of encouraging the use of personal computers — its Pratt & Whitney subsidiary still relies primarily on mainframes, even for office automation.

Autonomy breeds creativity

Autonomy, however, can also breed creativity, Bennett said. Three years ago, he recalled, the company's corporate leadership decided to implement a program to integrate micros into each operating unit. More than 1,300 top managers from all of the subsidiaries were eventually trained on the IBM Personal Computer at a cost of $8 million.

However, the decision regarding the actual application, if any, for the personal computers was left up to each manager and operating unit. Some managers did eventually ignore the machines, Bennett pointed out, but others, particularly those in financial planning and real estate management, gave up their handheld calculators or mainframe terminals to use the machines.

On the operating unit level, United Technologies' subsidiaries, such as Carrier Corp., the air conditioner maker, have since established companywide electronic mail systems for routing messages from personal computers. Both Carrier and Otis Elevator North American Operations, another subsidiary, have also since developed personal computer programs to sell their products to customers in the building maintenance and contruction industries.

There was at least one down side to the autonomy offered to the personal computer users: Many could not access data on their company mainframe, and, because the subsidiaries are independent, Bennett could do nothing for them. In a conglomerate of independent subsidiaries, mainframe access is "the primary responsibility of the operating unit," he said.

One sector of the corporation in which Bennett will permit no mavericks, however, is in the use of Technet, the 5-year-old United Technologies communications network that his department manages. The network, for corporatewide voice/data communications, routes messages over a variety of paths, including satellite links and both leased and dial-up lines.

Bennett said Technet, one of the few centralized aspects of United Technologies' information management, was placed under his authority because "if [the operating units] aren't under the same management, someone has to keep them talking."

Bennett is not a typical data processing manager, and his office on the 22nd floor of United Technologies' world headquarters reflects the difference. Furnished with a couch and a hardwood desk that would please any vice-president, the office has two glass walls, one of which offers a panoramic view of Hartford and its environs.

Also atypical is Bennett's background. He has a Ph.D. in applied mathematics from Harvard University, and his first management job in data processing came in 1971 when he was promoted from chief of mathematical analysis at the United Technologies Research Center to DP director at the company's Sikorsky Aircraft subsidiary, reportedly the world's largest helicopter maker.

The transition from the research center to the DP shop was "something of a culture shock," he recalled. He soon found, however, that he "probably had something of an advantage coming in from the research center, whose job is also to manage technology." Bennett still runs a DP shop; he oversees the operation of a Digital Equipment Corp.

VAX-11/780 in use at the corporate headquarters for office automation.

Looking back on his 14 years of DP management at United Technologies, Bennett observed, only half in jest, that "the computer has made major inroads in almost every department except the data processing department." This failure to automate, he said, is reflected in the extensive backlog of applications development, and this, he added, is the foremost DP problem facing United Technologies.

To reduce its backlog, Bennett said, the firm will soon "put in place [software development] tools that will do a lot more than one programmer can do." In classic United Technologies fashion, those packages will be chosen by a committee.

Though an advocate of decentralized decision making, Bennett acknowledged that there are times when the key to a project's success is a statement of support from corporate headquarters. Such support was needed when the company began its personal computer training in 1982. To spur enrollment in the training, Bennett obtained a videotape endorsement of personal computing from United Technologies Chairman Harry Gray. The course proved a success but missed its objective of training all top company executives.

Gray, it seems, did not attend. The United Technologies chairman, Bennett said, does not use a personal computer.

WHY FOLLOWERS OFTEN LOSE SIGHT OF THE LEADER

In their predictable attempts to follow our lead, our competitors have invariably lost their sense of direction. So when you first look at the new AGILE 6287, our competitors are precisely where you'd expect.

Nowhere in sight.

Easily visible, however, are the engineering and design excellence of the AGILE 6287. If you are looking for an alternative to IBM's limited and expensive selection of printers for your 3270 system, attach the ASCII printer or plotter of your choice with an AGILE.

The 6287 supports full-feature emulation of most IBM 3270 printer applications, including APL. With built-in diagnostics, internal power supply, and fan cooling, the 6287 is backed by a full two-year warranty.

For plotters, laser printers, dot matrix, daisy wheel or high speed printers, the reasons to choose the AGILE 6287 are clear.

But if by chance you do look at our competition, tell them we said hello.

We haven't seen them in years.

CONNECT ASCII PRINTERS & PLOTTERS TO IBM 3270 CONTROLLERS

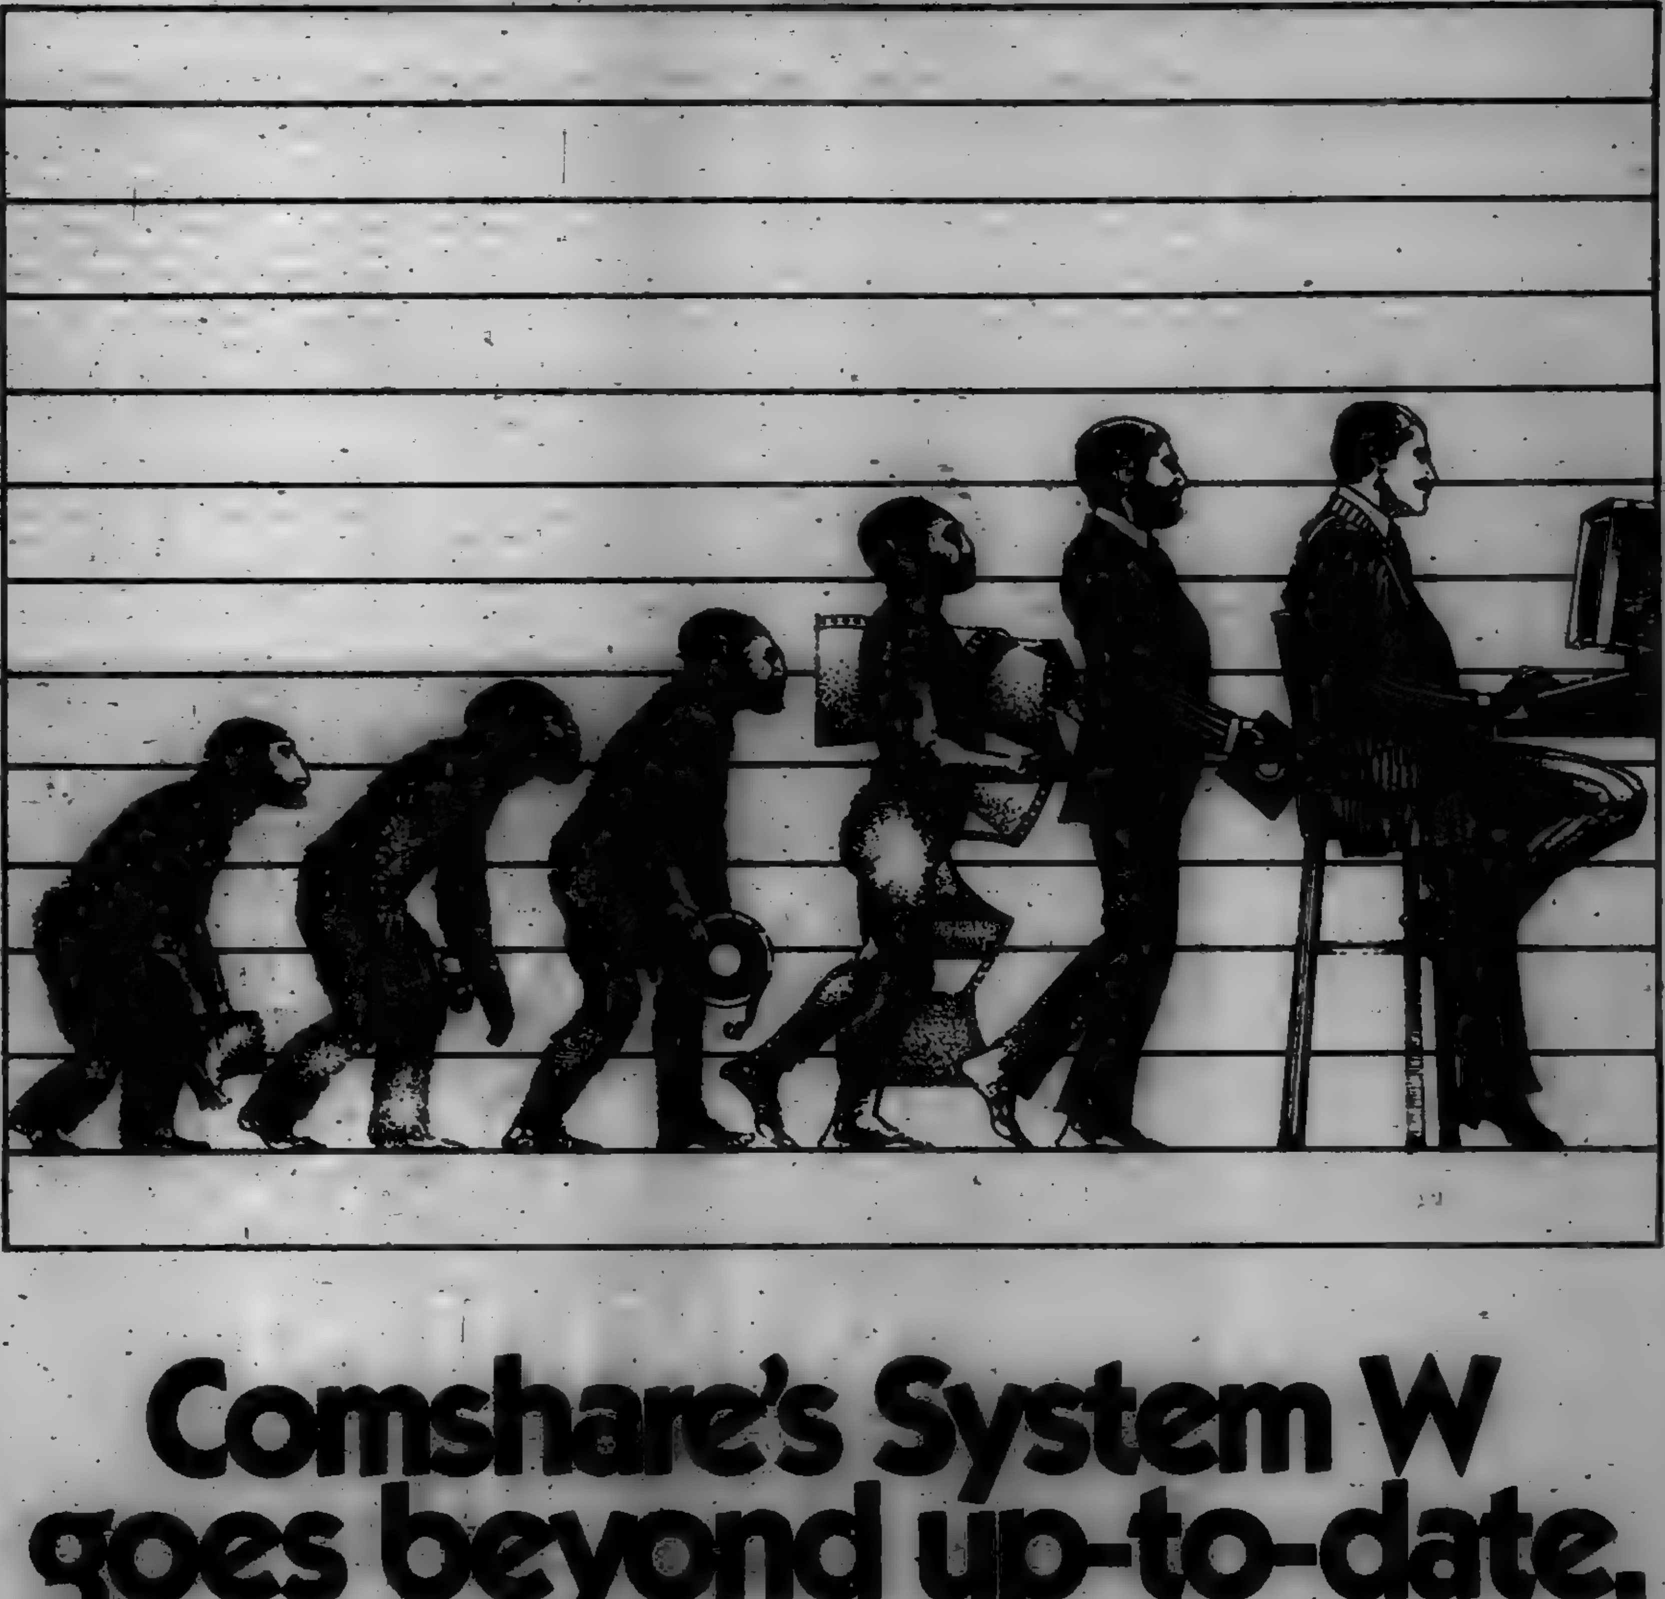
A HISTORY OF DECISION SUPPORT SOFTWARE



Comshare's System W goes beyond up-to-date.

A 1970's business modeling system with bolted-on data management capabilities is as up-to-date as a wax tablet and a stylus. And about as effective at lightening DP's workload.

Comshare has put $10 million and 18 years DSS experience into the extraordinary System W. And along with System W, we've also provided the software facilities you need to do a professional job of servicing your end-user needs.

For example:

With System W's integrated data management and File Power, you can set up data acquisition sequences including interfacing to corporate and external data in a variety of forms. File Power is the built-in response to the user's most often asked question, "How do I connect to the data?"

And with Distributed W, you have compatible micro DSS software with integrated telecommunication that sends files and models both ways asynchronously or synchronously. And System W operates on IBM mainframes with VM/CMS and MVS/TSO giving you flexibility as your operating system plans change.

Our Commander Learning Station gives end-users the latest in computer-based training on an IBM PC. Courses are available for System W as well as generic courses on how to model and use VM/CMS.

There's more. But System W is, simply, the best choice for decision support on IBM computers for excellent ease-of-use and integration. It's popular with end-users. Plus, it's easy to install, operate and interconnect with your DP architectures.

We started from scratch. System W is engineered to take full advantage of new technology. It's not an upgrade of an old product straining to keep up with the times. System W is as up-to-date as tomorrow.

For more information, call Chris Kelly at Comshare toll-free: 1-800-922-SYSW (in Michigan call: 313-994-4800). Or simply mail your business card to: Comshare, P.O. Box 1588, Ann Arbor, Michigan 48106.

South Africans prepare for U.S. DP export ban

extended if the Congress considers insufficient progress is being made to effect change," van Vuuren said. "The South African customers would look to other suppliers."

One of those suppliers is Persetel, Ltd., the South African company that sells Hitachi Ltd. mainframes in South Africa through BASF of West Germany. The same company sells media products in the U.S. as BASF Systems Corp. in Bedford, Mass. "Persetel has made major inroads into IBM's mainframe marketing in this country," said Alan Dawson, editor of *Computer Week*, a publication covering the computer industry in South Africa. "They are positioned to move in and take over if they need to. They are giving IBM a run for their money." IBM is considered the leading vendor in South Africa, Dawson said.

Other companies with a strong presence in South Africa are Siemens AG and Nixdorf Computer AG of West Germany and ICL of England, according to van Vuuren. "The South African marketplace is a cosmos of all the electronic data processing markets in the rest of the world," van Vuuren said.

Estimates of annual computer sales revenues in South Africa range from $500 million to $900 million. The restricted government market may be 20% of the total South African computer market, van Vuuren estimated. "It is a very large sector we have been excluded from," he said.

Exactly what computer equipment the Department of Cooperation in Pretoria is using to administer the pass-book system, in which each of the nation's 24 million blacks is supposedly registered, is a state secret, several sources said.

Van Nunen, the Computer Users Council spokesman, said the U.S. restrictions would not prevent South African users from obtaining needed technology. "If the supply [of computer equipment] were to be restricted, it will not stop technology from coming into South Africa," he said. "The only impact will be that the U.S. will become a supplier looked on with less favor for any future decisions. South Africans will look elsewhere. It will be a great pity."

The Japanese and Europeans would be the most likely to step into the breach, in van Nunen's view.

According to an IBM spokesman specializing in the firm's South African business affairs, who asked not to be identified, the threat of trade restrictions has caused some customers to "hedge their bets and go with foreign competitors." And sales representatives from foreign countries are exploiting the users' fears of losing their computer equipment sources, the spokesman said. Addressing the restrictions, the spokesman said, "We prefer to operate without regulation, but we comply with all U.S. laws and regulations. Our preference is to operate in a free market environment."

Clarifying what he described as a misconception, the IBM spokesman added, "Most people believe we're in South Africa for cheap labor. But we don't manufacture there, and we pay equal pay for equal work."

Whether the Japanese and European computer companies would sympathize with a U.S. restriction on sale of equipment to the government is not yet known, but is considered unlikely. A spokesman for Persetel in Johannesburg, Product Manager Peter Cilliers, said, "Our standpoint is, we comply with all the regulations and principles of the respective countries of companies that supply equipment to us." He said he understood the Japanese "are reviewing the situation," but his company has not formally requested a ruling.

Vendor spokesmen describe the U.S. trade restrictions as a two-edged sword because many U.S. companies doing business in South Africa pay a percentage of their revenues for social programs to benefit the blacks.

Trade restrictions are not the only issues faced by computer users and vendors in South Africa. Financial panic two weeks ago plunged the South African rand to a low of 34 cents to the U.S. dollar. The rand had climbed to 45.5 cents by the middle of

■

CSC withdraws from South African firm

Computer Sciences Corp. (CSC) of El Segundo, Calif., has withdrawn its 20% interest in the South African computer services firm Computer Science, Ltd. (CSL) of Johannesburg.

A spokesman for CSC in the U.S. declined to comment on why the company pulled out. Jim Furlong, manager of corporate communications for the firm, said, "I don't see much difference between this and what other companies are doing."

CSL Managing Director Ian Jones was quoted in the South African press as saying that the company's withdrawal had nothing to do with U.S. pressure for disinvestment. "Anything that happens with a U.S. company in South Africa today immediately has people suspecting a political move, but I don't believe that is the case here," Jones said. "CSC has chosen to invest in the development of new products and services in the U.S. rather than in [CSL]. As it is known, we did not make a profit last year."

Of a total revenue of $40 million rand in South Africa last year, CSL lost $5 million rand, the firm has said. The South African press reported the U.S. company has a $14 million rand interest in CSL, about $6 million U.S. dollars.

— John Desmond

A word for those who just bought a Unix system.

last week, but other issues took precedence. On Sept. 1 the South African government declared a four-month moratorium on debt principal repayments by South African companies on loans to foreign banks.

While the moratorium does not prevent multinationals from doing business in South Africa, it is a cause for concern. "The devaluation of the rand has had a very severe impact. We've had price increases in the last 12 to 18 months in excess of 60% for our users," van Vuuren said. "Users are thinking longer before making a decision."

Due to the sensitive situation in South Africa, what sources say off the record often differs markedly from comments made by official spokesmen.

The state of emergency imposed on 36 magisterial districts surrounding major South African cities has had an impact on day-to-day business. All the companies are making investments mindful of an ultimate risk. "The risk is that the whole country will plunge into civil war, and they may not get their payments," one source said.

■

U.S. high-tech firms' compliance rates high

Six U.S.-based high-technology firms were given a top rating for voluntary compliance with the Sullivan Principles, a code of conduct aimed at providing an equal opportunity for blacks in South Africa.

The six firms given top ratings in the latest report of compliance of U.S. companies doing business in South Africa were IBM, Burroughs Corp., Control Data Corp., Hewlett-Packard Co., Sperry Corp. and Xerox Corp.

Spokesmen for two of the firms said congressional and presidential approval of trade restrictions on the sale of U.S. computer technology to certain agencies of the South African government would hurt their efforts to comply with the principles.

A bill calling for restrictions, the Anti-Apartheid Act of 1985, is now being considered in the U.S. Senate.

The Sullivan Principles were drafted by the Rev. Leon Sullivan, a black clergyman from Philadelphia who became concerned about U.S. involvement with apartheid while he was a board member at General Motors Corp.

These principles call for the desegregation of "all eating, comfort and work facilities," as well as equal and fair employment practices.

Sullivan code signatories are asked to file semiannual reports that are summarized by Arthur D. Little, Inc., a consulting firm in Cambridge, Mass. The code is administered by the International Council for Equality of Opportunity Principles, Inc. of Philadelphia.

High-technology companies that received the second rating of "making progress" included Honeywell, Inc., ITT and Westinghouse Electric Corp.

Companies that received the lowest rating of "need to become more active" included Motorola, Inc. and NCR Corp., although both companies did pass the basic requirements.

"We have been doing many, many things in this country that go beyond the normal activity of selling computers," said Mias van Vuuren, general manager of South African operations for Burroughs, in an interview from South Africa. "We are spending millions per year in education and development programs for the blacks and deprived communities of the country. If any of our business volume disappears, it will make it very difficult for us to sustain the same level of community involvement.

"A cutback in our business means we will have to seriously look at what we can and cannot do," he said.

Any decision about pulling Burroughs out of South Africa would be made by Burroughs Chairman Michael Blumenthal. "It's not my decision because I'm a South African citisen," van Vuuren said. "I'd like to see Burroughs do business here for as long as we're allowed to do business. We believe our position in South Africa is a force for positive change."

Van Vuuren said he did not have a total on how much money Burroughs has spent since 1978 on community development programs, but he said the percentage increase is greater than the company's profit growth percentage year to year in South Africa.

IBM has spent more than $25 million since 1975 on community development, according to an Armonk, N.Y.-based IBM spokesman who specializes in IBM South Africa's business affairs. Of the 1,914 employees in IBM South Africa, IBM employs 99% South Africans, 15% of whom are black South Africans, the spokesman said.

IBM committed $10 million this year to a computer-assisted language lab program in the South African schools, the spokesman said. Only 11 of every 100 blacks in South Africa reach the high school level, and fewer than .05% of South African blacks have a university education, the spokesman said.

The IBM program is expected to reach some 37,000 children in five years. IBM has also obtained a commitment from the South African Department of Education to restructure the curriculum for black South African school children, the spokesman said.

"IBM has determined it will take significant efforts to bring about meaningful change in that country. Our resources are dwarfed by the problems of the country," the spokesman said.

— John [illegible]

Ouch!

If you bought a computer system with a Unix™ operating system for business data processing, this is going to hurt. Nothing will serve your business needs better than the Ultimate™ operating system.

Sure, Unix is fine for scientific applications. After all, it was designed to serve scientific researchers—a technically sophisticated group of people. But the Ultimate operating system was designed specifically for business data processing. It's not only far easier to use—it's the most powerful tool your business can have.

But don't take our word for it. We invite you to take your business application and benchmark us against Unix or any other operating system. Odds are, we'll win every time. And for ease of use, flexibility, speed and efficiency, we always come out on top.

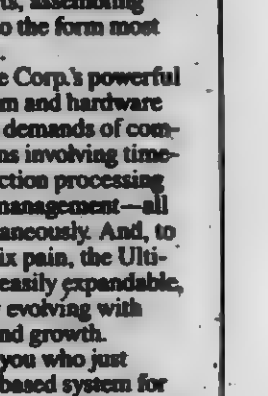
If that doesn't hurt enough, consider: this operating system is already in use on computers manufactured by 19 of the leading companies including IBM and DEC. Over 30,000 have been installed worldwide. And satisfaction levels are overwhelming.

Only the Ultimate operating system is implemented beyond the software—right in the hardware—to provide unmatched speed, efficiency and power. It conserves computer space and resources. It puts all the information you need for creative problem solving and decision making right at your fingertips.

Based on everyday English words and phrases, its proprietary language is a breeze for the beginner as well as the expert programmer. Its dictionary file system makes information instantly available and gives you exceptional flexibility in report writing. Unlike other systems where the reports in the system are the only reports you get, Ultimate lets you quickly design your own reports, assembling information into the form most useable for you.

The Ultimate Corp.'s powerful operating system and hardware easily meet the demands of complex applications involving time-sharing, transaction processing and data base management—all running simultaneously. And, to add to your Unix pain, the Ultimate system is easily expandable, cost-effectively evolving with your changes and growth.

For those of you who just bought a Unix-based system for your business—our condolences. For those of you who have been considering it—it's not too late! Call us today at (201) 887-9222, ext. 324, and avoid the pain.



ULTIMATE

AT&T, Sun to converge on Unix standard

Berkeley 4.2-based systems, an AT&T spokesman said.

According to an AT&T spokesman, the agreement is precedent setting because it will incorporate non-AT&T modifications to Unix into AT&T's System V definition for the first time.

"When the System V and [Berkeley 4.2] shells are merged, all that will be part of the System V definition," the spokesman said.

The joint effort of Sun and AT&T may or may not result in a new release of Unix System V, according to the AT&T spokesman.

"We just don't know yet," he continued.

The timetable for the completion of the project is early 1986, the AT&T spokesman said.

However, a spokesman for Sun predicted that the project may require 12 to 24 months for completion.

AT&T rolls out 1M-bit chip

Full production slated for early next year

BERKELEY HEIGHTS, N.J. — Claiming a jump on widespread competition, AT&T last week said it has begun production of 1M-bit random-access memory chips that it is now offering for sampling by selected commercial customers.

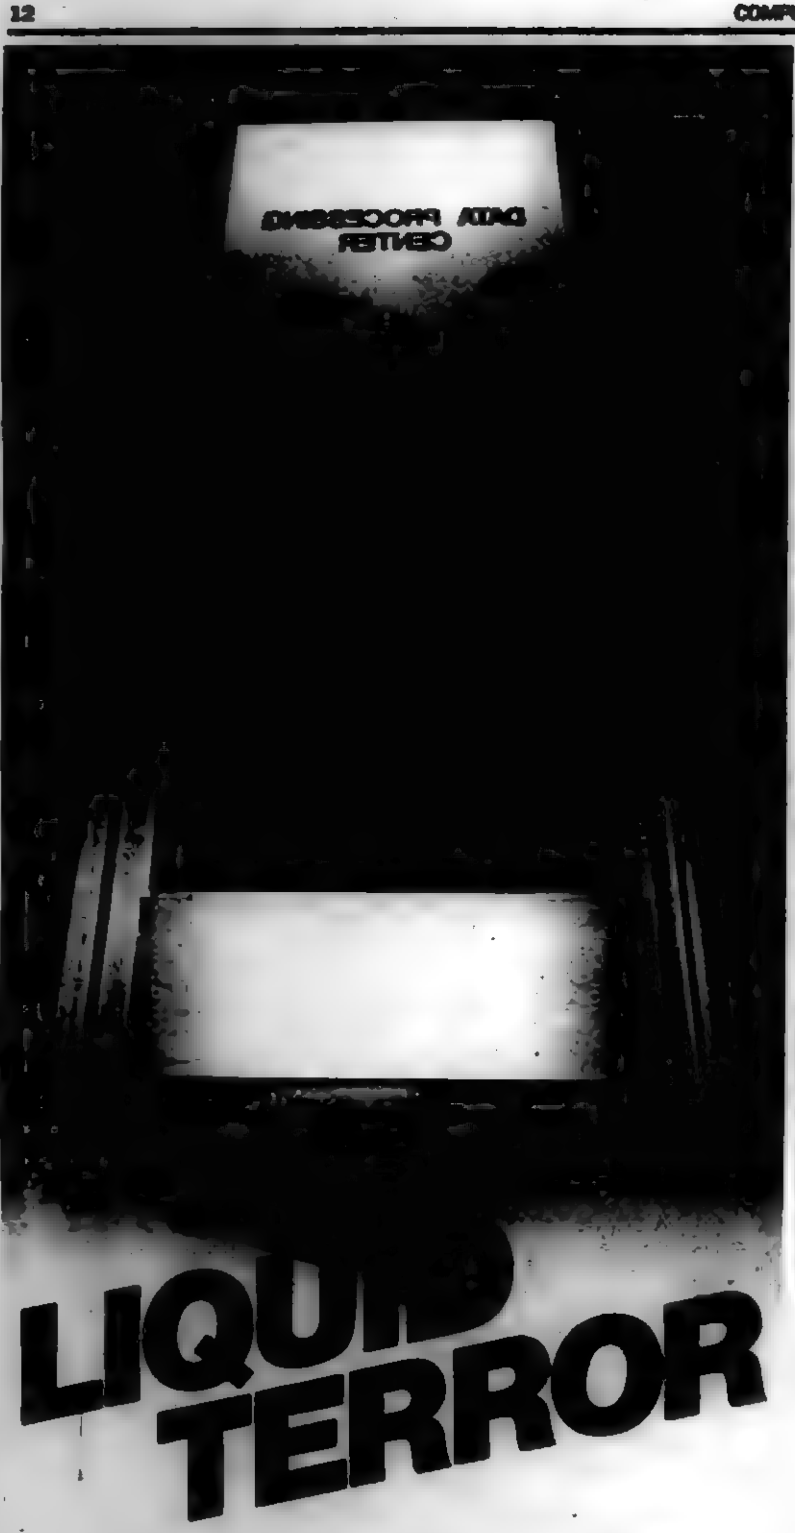
The company said it plans limited commercial production by the end of this year and full production early next year.

Several vendors have announced prototype development of 1M-bit chips, including large Japanese vendors and IBM, but AT&T claimed to be the first U.S. firm to reach an advanced stage in production.

In a prepared background statement, Bob Lucky, executive director of AT&T Bell Laboratories' Communications Sciences Research Division, said the 1M-bit chip will allow vendors to cross a threshold in the cost of silicon memory that will make feasible a whole array of new functions on personal computers.

A computer using the 1M-bit chip and a 32-bit microprocessor "has essentially all the power of today's mainframes and could someday be cheap enough and small enough to be sold as a personal computer for the home or office," Lucky said.

AT&T predicted that revolutionary developments are also likely in laptop computers because the 1M-bit chip requires less power and less physical space than existing memory chips.



You're alone, working late. Trying to get the last batch run put to bed. Suddenly, everything goes dead: your system, your memory, your career. Another victim done in by an undetected water leak.

But it doesn't have to end like that. Because we've created the TraceTek® 100 Leak Sensing and Locating System. It's the only system that simultaneously detects water, sounds an alarm *and* pinpoints the leak source for fast action.

So stop worrying. And start filling out the coupon below and send it to us. Or call us today at (415) 361-4602. We'll show you how to protect yourself from water leaks. Before they turn into…liquid terror.

Raychem

Regulation of bulletin boards faces strong opposition

By Mitch Betts

WASHINGTON, D.C. — The American Civil Liberties Union (ACLU) and a group of computer bulletin board operators are mobilizing to fight legislation that would regulate the content of bulletin board messages, spokesmen for both groups said recently.

The lobbying campaign is a response to several recent legislative efforts to stop bulletin boards from posting computer passwords, network access codes, credit card numbers, pornography and other messages that can be used for illegal purposes.

Examples of these legislative efforts include the following:

■ U.S. Sen. Paul S. Trible Jr. (R-Va.) introduced a bill (S. 1305) to make illegal pornographic bulletin boards such as "sex talk computer services" and computer networks run by child molesters who share information about their victims.

■ State Sen. John Doolittle (R-Calif.) sponsored a computer crime bill (S. 1012) that would make it illegal for anyone to place a password, access code or financial account number on a computer bulletin board without authorization and would make system operators liable once they are notified.

> ”
>
> *'The technology of bulletin board systems has developed faster than the ethics.'*
>
> — **Richard Cashion**
> **Tennessee Technological University**

■ The computer crime committee of the Data Processing Managers Association (DPMA) is drafting model legislation that would outlaw actions that contribute to a computer crime such as posting a computer password or network access code on an electronic bulletin board [CW, July 1].

Jerry J. Berman, chief legislative counsel for the ACLU here, said he is urging system operators to oppose the legislation — especially the Trible bill — on grounds that electronic bulletin boards are akin to newspaper publishing and, thus, are protected by the First Amendment right to free speech.

Government regulation may have a "chilling effect" on this form of electronic publishing because it will prompt operators to censor their bulletin boards for fear of prosecution, Berman said.

Moreover, legislation that makes operators liable for the messages on their systems places a great burden on operators to monitor them, Berman said, adding that the burden may put some out of operation.

Paul Bernstein, a Chicago attorney who runs a bulletin board, agreed. He said politicians are moving too fast with the legislation without understanding the technology, the beneficial uses of bulletin boards or the burdens of monitoring the systems.

Bernstein said he and other system operators plan to revitalize the National Association of Bulletin Board System Operators so it can lobby Congress and perhaps draft a code of ethics.

In response, an aide to Trible said there is no constitutional protection for obscenity, and Congress frequently has outlawed the use of interstate communications facilities for criminal purposes.

A hearing on S. 1305 is scheduled for Oct. 1, the aide said.

Supporters of the computer crime legislation said it is needed to curb a rash of computer trespasses caused by hackers who obtained access codes and passwords from underground bulletin boards [CW, June 24].

"The technology of bulletin board systems has developed faster than the ethics," commented Richard Cashion, who is drafting the DPMA bill and who is assistant DP director at Tennessee Technological University in Cookeville, Tenn.

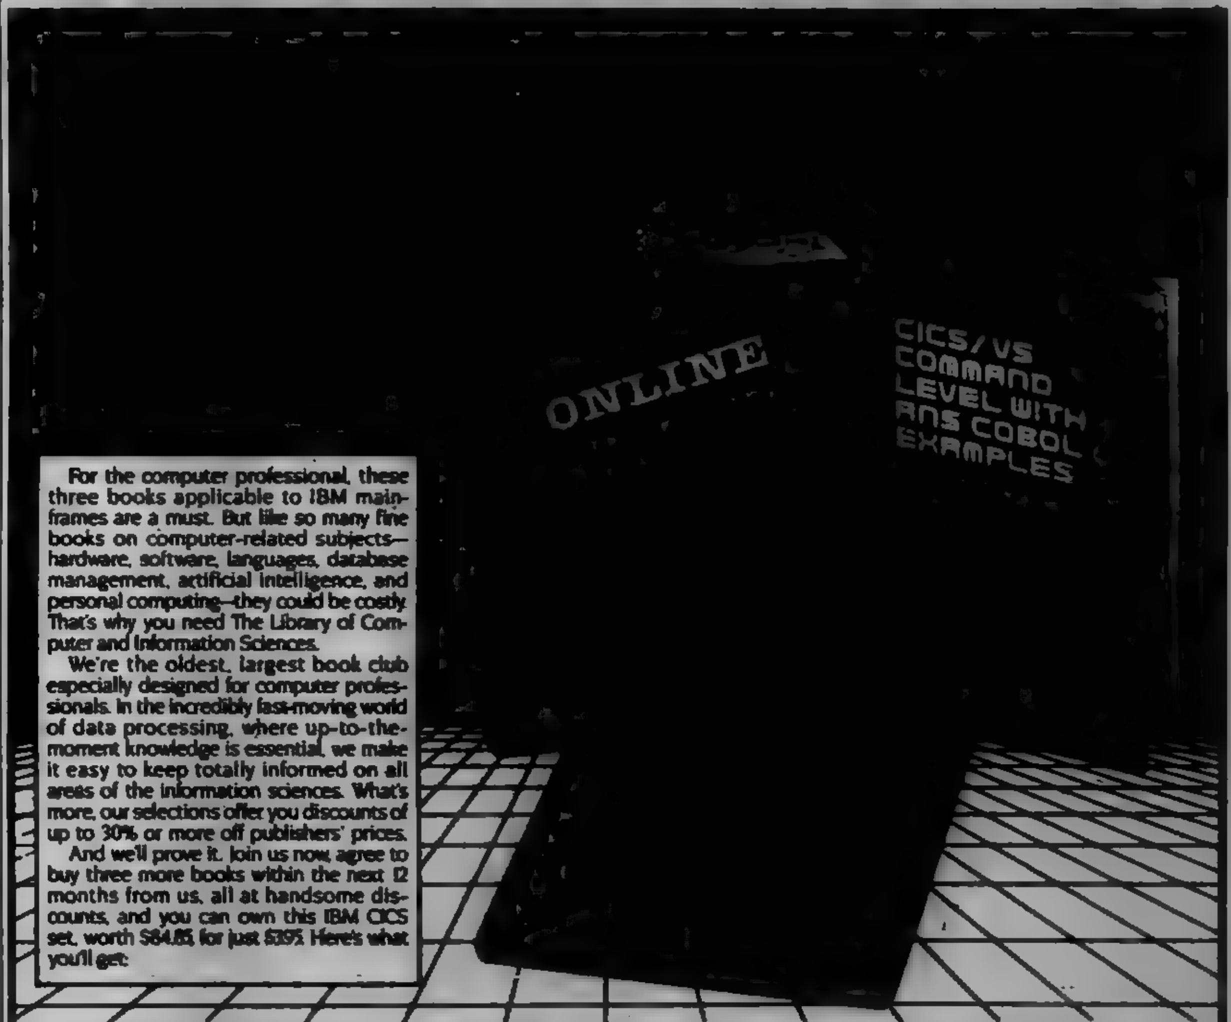
Donald G. Ingraham, an assistant district attorney in Alameda County, Calif., said he strongly supports the Doolittle bill, which recently passed the state Senate and is pending in the Assembly's Committee on Public Safety.

"Our main point is that we are dealing with the misuse of stolen property [such as passwords and credit card numbers]. There is no First Amendment protection for criminal activity," he said.

John T. Vanadia, a spokesman for the EDP Auditors Association, said he supports tough legislation.

"The security responsibility of DP managers is difficult enough even without these bulletin boards passing on passwords and access codes," he said.

In a related development, the California legislature is studying a proposed state constitutional amendment (ACA. 9), sponsored by Assemblywoman Gwen Moore, that would guarantee the freedom to communicate electronically on all subjects. The ACLU-supported amendment also would protect against unwarranted search and seizure of personal information stored in information systems.



For the computer professional, these three books applicable to IBM mainframes are a must. But like so many fine books on computer-related subjects—hardware, software, languages, database management, artificial intelligence, and personal computing—they could be costly. That's why you need The Library of Computer and Information Sciences.

We're the oldest, largest book club especially designed for computer professionals. In the incredibly fast-moving world of data processing, where up-to-the-moment knowledge is essential, we make it easy to keep totally informed on all areas of the information sciences. What's more, our selections offer you discounts of up to 30% or more off publishers' prices.

And we'll prove it. Join us now, agree to buy three more books within the next 12 months from us, all at handsome discounts, and you can own this IBM CICS set, worth $84.85, for just $3.95. Here's what you'll get:

On-Line Systems Design and Implementation Using COBOL and Command Level CICS
Charles J. Kacmar's example-filled guide shows you how CICS is structured and how transactions are initiated, controlled and terminated. It's written from the viewpoint of a working designer who needs to be able to quickly evaluate the impact of different design decisions upon the application. Publisher's Price: $26.95.

CICS: Mastering Command Level Coding Using COBOL

William G. Bruno and Lois Bosland spell out how transactions are initiated, the role of internal CICS tables and work areas, how to handle abend processing and exceptional conditions, how to format screens using BMS, how to handle files, reading and browsing, adding and deleting, file pointers, and much more. Publisher's Price: $24.95.

CICS/VS Command Level with ANS COBOL Examples

Pacifico A. Lim's practical handbook shows how to design and code in a CICS environment. All the tools and techniques necessary for on-line teleprocessing concepts, screen layout, BMS mapping, program components, the linkage section, pseudoconversational coding, and much more. Publisher's Price: $32.95.

MEMBERSHIP BENEFITS: In addition to getting the CICS Programmer's Library for only $3.95 when you join, you keep saving substantially on the books you buy. Also, you will immediately become eligible to participate in our Bonus Book Plan, with savings up to 70% off the publishers' prices. At 3-4 week intervals (16 times per year), you will receive The Library of Computer and Information Sciences News, describing the Main Selection and Alternate Selections, together with a dated reply card. If you want the Main Selection, do nothing, and it will be sent to you automatically. If you prefer another selection, or no book at all, simply indicate your choice on the card and return it by the date specified. You will have at least 10 days to decide. If, because of late mail delivery of the News, you should receive books you do not want, we guarantee return postage.

The Library of Computer and Information Sciences 7-CS9
Riverside, NJ 08075

Please accept my application for trial membership and send me the CICS Programmer's Library (00689), billing me only $3.95 plus shipping and handling. I agree to purchase at least three additional Selections or Alternates over the next 12 months. Savings range up to 30% and occasionally even more. My membership is cancelable any time after I buy these three books. A shipping and handling charge is added to all shipments.

No-Risk Guarantee: If I am not satisfied—for any reason—I may return the CICS Programmer's Library within 10 days. My membership will be canceled, and I will owe nothing.

Computerworld 9/9/85

Government DP costs plateau

Outside vendor services to consume half of budget

By Mitch Betts

WASHINGTON, D.C. — Just as in the private sector, expenditures for computer technology by the U.S. government have reached a plateau after years of increasingly heavy spending, according to figures recently released by the U.S. Office of Management and Budget (OMB).

A new OMB report said the federal information technology budget rose sharply by 13% a year between fiscal 1982 and fiscal 1985 when the figures are adjusted for inflation. But the inflation-adjusted budget will remain constant — at $13 billion — between fiscal 1985 and fiscal 1986, the OMB said.

The flattening DP budget, however, hides an important trend: The government increasingly gets its DP and telecommunications services from outside vendors. By fiscal 1986, almost half of the federal DP budget will be owed to commercial services, the OMB said.

Perhaps because of this move to commercial services, the size of the government's in-house DP work force is growing slower than in the past and will increase only 1% between fiscal 1985 and fiscal 1986, the report said.

In a departmental breakdown, the OMB report showed that the U.S. Department of Defense continues to dominate the federal DP budget. The department plans to spend $7.7 billion in fiscal 1986 (in current dollars), about half the federal budget for information systems.

The OMB figures indicated that information systems represent 1.6% of the total budget of the U.S. government. "While it has become a cliche to observe that the federal government is an information enterprise, it is important to realise that many federal programs simply could not operate without effective technology support systems," the report said.

The observations came from "A Five-Year Plan for Meeting the Automatic Data Processing and Telecommunications Needs of the Federal Government," an OMB report that is more a compendium of DP management strategies and statistics than it is a five-year plan.

The report discussed the value of information systems planning and security programs, the need to improve management over software maintenance and end-user computing and the need to respond to new computer technologies and the rapidly changing telecommunications marketplace.

One OMB strategy is to encourage agencies to use commercial, off-the-shelf software rather than custom-developed programs to save on software development and maintenance costs [CW, Feb. 25].

The OMB also said it will give extra management scrutiny to eight major government DP projects, such as the Patent and Trademark Office's automation program and the Social Security Administration's modernization program.

A separate report — the federal DP inventory published by the General Services Administration's Federal Equipment Data Center — said that in fiscal 1984 the U.S. government owned or leased 206,512 items of DP hardware, valued at more than $6.7 billion. However, this inventory counts only items that are components of computer systems costing more than $50,000, thus omitting minicomputers and micros.

By dollar value, Sperry Corp., IBM, Control Data Corp., Honeywell, Inc., Digital Equipment Corp. and Burroughs Corp. were the largest suppliers of DP equipment to the government, in that order.

The Office of Management and Budget projects a flat rate of expenditures for data processing.

MEMORANDUM

TO: IBM SYSTEM 34 USERS
FROM: OMNI RESOURCES, INC.
(Subsidiary of The Kirchman Corporation
and sister company to Florida Software Services)

DATE: 1985

SUBJECT: IF YOU ARE READY TO SELL YOUR SYSTEM 34 ...
... WE ARE READY TO BUY IT!!

PLEASE CALL 1-800-327-1892;
IN FLORIDA, CALL 1-800-432-6610;
PLEASE ASK FOR OUR VAR ADMINISTRATOR.

OMNI Resources, Inc., the most successful in-bank software supplier for the IBM System 34 and System 36, is committed to serving America's independent community banks. We are looking for System 34 users who have decided to upgrade to the System 36 and want to sell their System 34. OMNI wants to buy your System 34, package it with our OMNI software and provide an even more affordable in-house solution to our smaller community-banking customers. Our goal is to reduce the initial cost of hardware to these banks by providing them with the alternative of using a System 34 with the finest software available in the industry. We continue to demonstrate our desire to offer solutions that the banking industry can afford.

At OMNI — "YOUR BANK IS SURROUNDED BY THE SOLUTION."

P.S. — If you're a System 34 user and not an OMNI customer, give us the opportunity of sharing the most competitive System 36 prices available anywhere with you. Maybe it's time you discovered that OMNI is the right solution for your bank.

(OMNI Resources, Inc., Post Office Box 2269, Orlando, Florida 32802)

Census Bureau counts 1984 hardware shipments

By Mitch Betts

WASHINGTON, D.C. — Nearly 88% of the digital computers shipped in 1984 were priced at less than $2,500, but that 88% accounted for only 28% of the total value of computer shipments, according to statistics from the U.S. Bureau of the Census.

Sales of large computers — retailing for $1 million or more — had a value of more than $1 billion but represented less than 1% of the number shipped, the Census Bureau reported.

The figures are from a recent Census Bureau report that, for the first time, provides production statistics on general-purpose digital computers by retail price categories. The large number of inexpensive computers highlights the growing influence of microcomputers in the computer industry, noted Stephen Pope, the analyst who prepared the report.

The report showed that while the total value of computer shipments increased by 35% from 1983 to 1984, quantities shipped increased less than 1%, to 4,157,513 units.

Value of peripherals shipped up 13%

The total value of peripheral equipment shipped in 1984 was $18.9 billion, up 13% from the previous year, the report added.

The bureau also reported the following:

- Shipments of general-purpose computer terminals remained relatively constant from 1983 to 1984, valued at roughly $2 billion in both years.
- Shipments of point-of-sale terminals and funds-transfer terminals together were valued at $871.3 million in 1984, an increase of 14% from 1983.
- Shipments of automatic typing and word processing machines were valued at $1.9 billion in 1984, an increase of 21% from 1983.
- The value of magnetic tape drives shipped in 1984 was $882.6 million, up from the 1983 level of $772.3 million. Likewise, the value of magnetic tape shipped in 1984 was $204.4 million, up from $116.8 million in 1983.
- The value of disk drives shipped in 1984 was $4.9 billion, up from the 1983 level of $4 billion. The value of both rigid and floppy disks shipped in 1984 was $1.6 billion, down slightly from the 1983 level of $1.7 billion.
- The value of computer printers shipped in 1984 was $1.7 billion, down from $1.9 billion the previous year.

Copies of the Census Bureau report, "Computers and Office and Accounting Machines, 1984 (Current Industrial Report Series MA35R)," are available from the U.S. Government Printing Office in Washington, D.C.

Bureau tallies robot 'births'

By Mitch Betts

WASHINGTON, D.C. — The U.S. Bureau of the Census, after nearly 200 years of counting people, has counted the number of robots "born" in the U.S. for the first time: 5,535 robots in 1984.

The new report said 75 companies shipped that number of complete robots in 1984, at a value of $306.7 million.

The automotive industry is the primary customer of industrial robots, and the report showed that the single largest category of industrial robots were those used for welding, soldering, brazing and/or cutting. Shipments of these units totaled 1,454, or 27% of all robots shipped, the Census Bureau said, adding that their value was $124.2 million.

In other categories, the report said that 450 robots used to spray, paint or glue materials were shipped last year, at a value of $58.8 million. Also, 613 assembly robots were shipped, with a value of $29.1 million.

Before the Census Bureau survey, robot statistics were either estimates by industry analysts and consultants or statistics compiled by the Robotic Industries Association (RIA) of Dearborn, Mich.

Donald Vincent, RIA executive vice-president, said he welcomes the Census Bureau effort because it is the first step toward government recognition of the robot industry. He said the government census is the first procedural step required for the U.S. Department of Commerce to assign the industry a Standard Industrial Classification code in 1987.

RIA statistics showed that 3,060 robots were shipped in 1983 at a value of $194.4 million [CW, Dec. 17], and 5,136 robots were shipped in 1984 at a value of $332.5 million.

Although the Census Bureau and RIA figures for 1984 are similar in magnitude, the Census Bureau said the number of shipped robots was 399 units higher than the RIA estimate.

Copies of the Census Bureau report, "Robots, 1984 (Current Industrial Report Series MA-35X)," are available from the U.S. Government Printing Office in Washington, D.C.

*As part of your subscription to Burroughs World, Honeywell Monthly and NCR Monthly include a variety of valuable services including electronic bulletin board, co-op buying services, software exchange listings, etc. Business microWorld includes bulletin board services.

☐ ***BURROUGHS WORLD****
Burroughs World features product news, technical articles and software/hardware reviews for users of Burroughs systems. *Burroughs World* provides coverage of the entire range of of Burroughs and third-party vendor products. *Burroughs World* is considered the primary source of information about Burroughs products by subscribers. .... [illegible]

☐ ***BUSINESS microWORLD****
For Convergent Technologies OEMs and users
CT Business microWorld is a monthly magazine for users and OEM's of Convergent Technologies products, including the Burroughs B25, NCR WorkSaver, Gould Power Station and AT&T's CT offering. The magazine provides independent news and reviews of CT hardware offerings, compatible hardware and software, and profiles of what users are doing with the CT line of products, which includes the NGen, all the way up to the MegaFrame. .... [illegible]

☐ ***HONEYWELL MONTHLY****
Honeywell Monthly features product news, technical articles and software / hardware reviews for users of Honeywell systems, from the DPS610 to the DPS88 systems. *Honeywell Monthly* is the only independent information source available to Honeywell users covering Honeywell systems. .... [illegible]

☐ ***IBM COMPATIBLES PLUS***
IBM Compatibles Plus is a monthly updated buyers guide and research service providing coverage of IBM compatible products; communications devices, printer, plotters, cables, memory devices, emulators and terminals. *IBM Compatibles Plus* includes technical articles, industry news and user profiles. .... [illegible]

☐ ***NCR MONTHLY****
NCR Monthly features news, technical articles and software / hardware reviews for users of NCR systems, from the NCR PC 4 to the V 8650 systems. *NCR Monthly* is the only independent source of information produced exclusively for NCR users. .... [illegible]

☐ ***TI PROFESSIONAL COMPUTING***
TI Professional Computing is a monthly magazine dedicated to the Texas Instruments Computer user. The magazine covers TI PC users independent software reviews, product profiles and user profiles. Also featured is the TI 990 Business System and the integration of the PC in micro-mainframe networks. .... [illegible]

☐ ***HI-TECH HOSPITALITY***
Hi-Tech Hospitality is the first in a series of industry-specific publications that deal with the application of high tech hospitality management systems. The publication features news and reviews on property management systems, point-of-sale systems, telecommunication systems, satellite communication systems, security systems, life / safety systems, office automation systems, personal computing systems, telephone systems, automated food and beverage preparation systems, as well as entertainment systems. In addition, *Hi-Tech Hospitality* will cover the design and architectural issues surrounding these products. .... [illegible]

☐ ***BURROUGHS SOFTWARE LIBRARY***
The Burroughs Software Library is a complete listing of software from both Burroughs and third parties for the complete range of Burroughs computers, published semi-annually. .... [illegible]

The Japanese 'problem'

When the going gets tough, the tough get . . . ugly.

The recent descent into name-calling and creative number crunching by U.S. and Japanese semiconductor trade groups has not been a pretty sight. When the slogan "red herring" resurfaced late last month in a countercharge from the Electronic Industries Association of Japan (EIAJ) against the U.S. Semiconductor Industry Association's (SIA) allegations of chip trade imbalance, it stirred up some unpleasant memories. How odd to hear the Japanese high-tech high flyers of the 1980s echoing a slogan from the U.S. political witch-hunts of the 1950s.

The increasingly bitter semiconductor trade battle heating up headlines in the business and trade press is more of a symptom than a problem in itself. The real problem, obviously, is the industry slump, which has prolonged and intensified the downward curve of the chip industry's roller coaster business cycle.

Just a few short years ago, when the chip foundries of Silicon Valley were churning out 64K-byte dynamic random-access memory (RAM) circuits to feed a demand then perceived to be insatiable, Japanese vendors simply shared in the wealth. There was competition but more in the sense of who could cut the next slice from an ever-expanding pie.

When demand slowed and advancing technology rendered simple RAM chips into off-the-shelf commodities, Japanese manufacturers did what they do best. They boosted their legendary high-volume, low-cost production lines and turned out cheaper semiconductors.

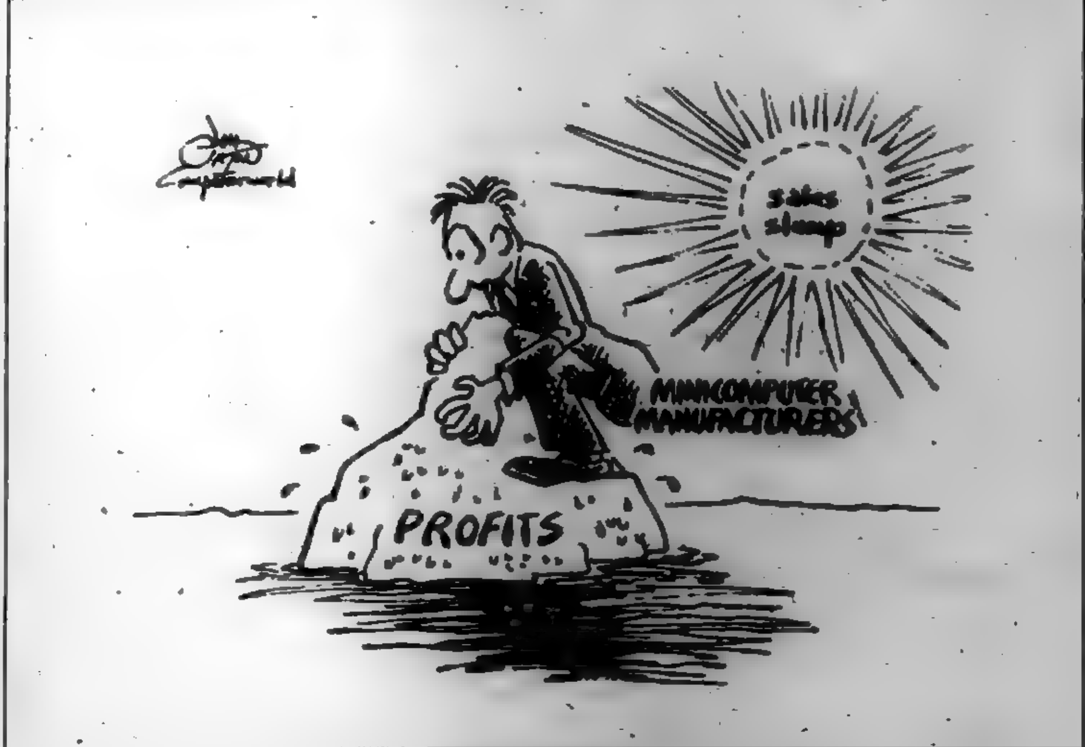
The U.S. companies have learned some painful lessons as the pie has shrunk, but much of the learning has come too late. Some important omissions include the failure to adapt to a commodity marketplace, overly aggressive capacity expansion and a tendency to continue milking a current, and declining, demand while neglecting to anticipate trends in end-user needs.

Times are extremely tough in the semiconductor business, but Japanese chip vendors have hardly been the cause; the basic law of supply and demand deals out penalties when manufacturers dwell on only the supply half of the equation. And now, even more important, restrictive trade actions, whether they increase U.S. chip sales in Japan or cut Japanese market share here, are not going to be the cure.

The current SIA-EIAJ dispute over market share figures is a simplistic approach to a complex industry — one in which distinctions between which products are American and which are Japanese, ordinarily a point of xenophobic pride, are becoming more blurred every day.

To cite just three examples, this is a world in which National Semiconductor Corp.'s National Advanced Systems subsidiary sells Hitachi Ltd. mainframes with an NAS label; RCA Corp. and Sharp Electronics Corp. have plans to build jointly Cmos chips in the state of Washington; IBM is about to complete an agreement with the government of Japan that will ease Big Blue's access to the research fruits of its Japanese cross-licensing partners.

In such a context, the angry voices of the semiconductor trade groups on both sides of the Pacific ring hollow. We safely presume that a semiconductor industry rebound, if and when it comes, will render those voices happily mute. Until then, we recommend silence and good works aimed at the corrective management steps that will facilitate that rebound.



Tip of the iceberg

LETTERS

Hawaii cited as ideal exporting location

I fear for the future of the U.S. high-technology industry when I read of large-scale layoffs at many U.S. high-tech firms, The slowdown in the computer industry seems to have hit many larger firms with unsold inventory and manufacturing excess capacity.

Yet for many small- and medium-size companies, rapid growth is still possible, especially in high-tech exports to the second largest computer market in the world — Japan — and the world's fastest growing computer market — Southeast Asia. There are also the newly industrialized Four Dragons: Taiwan, Hong Kong, Singapore and South Korea — all booming markets.

However, many U.S. firms don't think of exporting at all, deciding that it is next to impossible to market products to Asia half-a-world away. Hawaii, though, has been overlooked as the perfect site for marketing to Asia.

The Hawaii High-Technology Council was formed last year with state government and private sector support to aid U.S. companies that are investigating Asian marketing from Hawaii.

VIEWPOINT

On students, computers and the Soviets

LECHT ON SCIENCE
Charles P. Lecht

U.S. universities that have taken in a supercomputer as well as some Soviet graduate students may soon regret having done either or both. Department of Defense and other national security officials are being quoted in the overseas press, warning universities to be wary of their Soviet pupils. If students are studying science and are given open research access to our supercomputer systems, we are told that we must be especially careful. We must worry that some might, in the course of their studies, use these very same devices on behalf of the defensive — or even offensive — efforts of their home land. And that access by the students leaves our supercomputer facilities open to sabotage or espionage.

Reputed to be far behind the U.S. in computer technology and, at the same time, considered to be the foremost threat to U.S. national security, the Soviet Union presents us with motive for much of our defense program. For the past few years, schools like MIT, Brown University, New York University and Cornell University have been the recipients of new supercomputer systems, and with these, they have received various governmentally sponsored research grants related to defense. Therefore, it is not surprising that the issue of how to handle graduate students in science from the Soviet Union at schools such as these has come to the fore.

One precaution suggested by U.S. government officials is to ban Soviet graduate students from using university supercomputer facilities. The question is whether this is needed — forget about whether it is fair while their companions in the same courses from the U.S. have essentially unlimited use.

I do not believe that the Soviet students who have come here to do scientific research with supercomputers should be prevented from doing so because we fear that they might be running Soviet military applications instead of homework. This suggests that the Soviet Union is not worried about our surveillance of its results, or that they have a need to process work because the Soviet Union hasn't got supercomputers of its own.

If the Soviet Union lacks supercomputers, I'd like someone to explain how it developed its nuclear and space technologies. I've never believed it was behind the U.S. in the manufacturing and use of the kinds of logic and memory devices we use in our most vital defense areas — there are just too many signs to the contrary. From *Sputnik* to *Soyuz* to the hydrogen bomb, the Soviets have managed to come up with some fancy results, none of which could have been achieved without supercomputers.

Back to sabotage and espionage. Doubtless there is always the possibility of either from the students, but it is far less likely to occur from them than from trained experts in these nefarious arts. We need not be ashamed to warn all students, Soviet and American, of the penalties for becoming so engaged. And foreign students from countries that are not U.S. allies must be especially careful to avoid even the slightest appearance of involvement in such events.

So what about everything we read in the papers on the theft of our technology by the Soviets? Doesn't it mean that they lack our inventions? Why else would they be buying these through less than savory channels or even stealing them? Rather, it seems far more logical that they have been actively seeking our technology because in it is contained, at minimum, the message of where we are in the world of science and, at maximum, the secrets of our capabilities and limitations. This kind of information pieced together with other facts, such as which of our defense facilities are using a specific technology, can go a long way toward planning counter measures and those more aggressive. I'd be really disappointed if we weren't engaged in the same — forewarned is forearmed.

It cannot be viewed as anything but intelligent leadership that our defense and security establishments saw fit to outfit some of our universities with supercomputers and to support their development and application by providing research grants. If brains cannot be found in our leading academic institutions, then where else? It is only natural that we must take measures to protect the results from people who may do us harm. This can be best achieved by implementing systems security features, including those that preclude access to data bases and programs. Supercomputers are known to be super at such tasks as these. Faculty monitoring of the use of the systems is also in order, but I suspect this might be too much to ask. The unauthorized use of university computer facilities by faculty for personal reasons has always been nothing short of scandalous.

But, let's not get carried away by banning, not to speak of expelling, our Soviet students. We don't need another episode like the 1950s when suspicion of foreign students was followed by suspicion of their professors. The arrival of students from abroad is a positive step in the preservation of our way of life. Sure, there will always be a bad apple or two in the lot, but that's unavoidable. Most will go home after their training with fond memories of the fairness and freedom they found in the U.S. And that's just about the best conflict deterrent I can think of.

Lecht is chairman of Lecht Sciences, Inc., a New York-based think tank specializing in computer and communications technologies.

Maintaining morale when the contractors enter

THE DATA CENTER
John P. Murray

Many installations find that they must enlist the services of contract programmers to satisfy expanding demand. It is unfortunate that in some instances, while the contractors may do a very good job, because of the way their services are used, considerable harm can be done to the morale of the systems and programming staff.

It is not uncommon to find a situation where a new, unplanned system is required immediately. To respond to this demand, the management of the installation will review the work in progress and discover that all members of the systems and programming staff are fully committed to already approved projects and maintenance work. Given that situation and considering the need to begin the work immediately, the logical answer is to hire contractors.

So far, so good. The harm to morale does not usually arise with the introduction of contractors but with the assignment of duties once the contractors have arrived. Often the stance of the department management is that these people are expensive, that they have considerable experience and skills and that they will be best used on the new development project. Sounds logical, even reasonable.

Although that may be a very pragmatic approach, let's consider the effect it has on the members of the systems and programming staff, particularly those who are in charge of maintenance.

Application system maintenance, right or wrong, is often viewed as work that is less than desirable. It is often the case that those who have this responsibility accept it with reluctance and are eager to move to the development area. Given that scenario, it is easy to see the negative impact on morale when new people, who are not even employees, are brought in and assigned to more desirable work.

Because adopting the approach of the assignment of development work to the contractors sends negative signals to staff members, the adverse effect on morale is understandable. Sometimes managers will seek to justify this assignment of duties by saying that these contractors have prior experience on similar projects and can, therefore, do the job more rapidly.

It may also be stated, unfortunately, that the contractors are too expensive to be assigned to maintenance work. That position should tell everyone something about the feeling toward maintenance in that installation.

There have even been instances where management has stated that the contractors are unwilling to work on maintenance, and the only alternative available is to assign them to the development project. Clearly, in that situation, something is wrong. Either the management is so weak that it is unable to control the contractors, or it is simply a case of lying to avoid facing the issue. In either case, that installation has far more serious problems than those of dealing with contractor assignments.

The use of contractors can be effective while morale within systems and programming can be maintained if a different approach is taken. If it is necessary to bring contractors into the installation, they should, wherever possible, be assigned to work in the maintenance areas.

One exception would be in an enlightened installation where maintenance is understood to be a necessary and valuable component of the entire information processing function. In such a place, people with maintenance assignments are likely to be very satisfied with their work and probably will not want a different assignment. In that case, assignment of the contractors to the new projects will not create problems.

The idea that contractors are more experienced and that they can complete development work more rapidly may be quite valid. The problem is that using such an approach stifles the growth and development of the people within the installation.

In those departments where development work is considered to be the ultimate, the result will be a lowering of morale, a growing tension within the systems and programming section and ultimately an increase in turnover within the department.

Careless handling of the introduction and use of contract programmers can lead to more harm than good. As they press to attack the problems of an increasing work load, information processing managers must be aware of the needs and concerns of the staff.

To be effective, management must be carried out so that all staff members view it as being fair and even-handed. The most effective use of the contractors may not be the best approach in the long run.

Murray is director of management and information services for American Breeders Service, a DeForest, Wis., division of W. R. Grace & Co. and is the author of Management Information Systems as a Corporate Resource.

If you don't mind being insecure about data security, ACF2 might make sense.

ACF2 data security. Sense or nonsense?

With data security, you can't afford a #2 system. A second-best solution that demands a lot of time, talent and costly attention to operate and maintain.

TOP SECRET™

That's why TOP SECRET software is the #1 choice of more and more busy security decision-makers.

With TOP SECRET, you get the world's best MVS data security. Without the hassles.

Now, we'll tell you why.

You're more secure with TOP SECRET. We made TOP SECRET a no-nonsense security program right from the beginning. Everything you need for total MVS protection is part of the product. And it only improves with age.

At the core is a unique user-to-resource architecture that controls access to your facilities, resources and data at the people level. Where security really takes place.

With TOP SECRET, security never stops you from keeping up with processing demands. In short, we make sure the good guys get to authorized data quickly. And the bad guys get caught right away.

No fault default. From the moment you put in ACF2, everything is off limits. To everybody.

ACF2 gives you a closed system from the word go. Whether you're ready for that level of security or not.

TOP SECRET gives you default protection, too. But TOP SECRET lets you choose the best time to introduce it.

With TOP SECRET you efficiently secure resources and users in logical sequence. Not by rigid product demands.

And that's our secret: we make it easy to fit the world's best data security into the busiest dp schedules.

Fast, flexible security. For the way you do business. Whether you have 1000 branch offices in fifty states or hundreds of users in one location, TOP SECRET lets you custom-tailor security for a perfect fit to your organization.

ACF2 sets you up with centralized administration. And it's hard to change.

TOP SECRET software's flexible decentralized administration lets you delegate all or part of the security function where it makes the most sense for you. Within a department. At the divisional level. Or with only one security administrator, down from the top, if that fills the bill.

Security. With no strings attached. Because ACF2 requires modifications to the operating system, it ties up your technical staff. First they have to install the product. Then back it out and reinstall it every time there are mods. Whether IBM PUT-tapes or your own OS changes.

Since ACF2 doesn't comfortably support phased implementation, your technical team has to remain on call to phase in every new stage of security.

Plus you need them to write essential security requirements (like a password history!) that should be part of the product.

The fact is ACF2 chains your systems people to security maintenance.

With TOP SECRET, you may never need them at all.

Except for the hour or less it takes to install, TOP SECRET frees your systems people for other important jobs. You get easy maintenance without paying extra manpower premiums.

TOP SECRET. The sensible solution. So why do people put up with the inconvenience, added costs and high anxiety of ACF2?

Well, you're right. It makes no sense.

To find out why so many satisfied TOP SECRET users agree, call 1-800-CGA-TEAM (in New Jersey, (201) 946-8900) for more information. Or set up a TOP SECRET trial in your own shop. Free for 30 days. And make sense out of security yourself.

Today's MIS managers seen as facilitators of change

READER'S PLATFORM
John J. Connell

Traditional wisdom has it that computers and their use in MIS represent a mature technology supported by a substantial industry infrastructure that is conservative, slow moving and structured. Work is handled in an orderly way by professionals, caution is the watchword, and the boat is seldom rocked. But that was yesterday.

Today, the only constant in the world of computers and MIS is change. The challenge to those in the information field is to recognize and understand these changes and then to adapt to them. The challenge to general management is to facilitate that process of adaptation.

What are these changes? New machines, new systems, new approaches? Yes, all of these, but the basic underlying change is the move of computing and other technological capabilities out into the workplace. It is that phenomenon and its ramifications that will dominate the world of information technology in the years ahead.

Minis started the move

The move started with the introduction of minicomputers that offered an alternative to large data centers as a source of computing power. The term "distributed data processing" was coined to describe this development. In actual practice, however, minicomputer installations became small data centers managed by technical specialists, operating in parallel with and sometimes connected to large data centers.

The advanced office systems field continued the trend. It introduced word processing, electronic mail, teleconferencing and other capabilities for nonspecialists. In the process, it changed the face of the information technology world and enlarged beyond measure the number of people who use such capabilities as part of their regular work.

However, the advanced office systems field has been slow in developing. One can point to many success stories, but overall, the field has not yet lived up to its potential. Nevertheless, advanced office systems represent a major thrust to move technology into the workplace. The pace of that change has accelerated greatly with the advent of micros.

It is important to recognize that the driving force behind the introduction of microcomputers has not been the information technology community. Rather, it has been nonspecialists who want computing capabilities available at their fingertips. In many cases, micros are being introduced over the objections of information technology professionals, but, as legitimate as some of those objections may be, there is no holding back the tide. Knowledge workers need these machines to do their jobs effectively, they recognize the need, and they insist that their needs be met.

This development is a basic change in direction in the information technology field and calls for a reexamination of the philosophical underpinnings of that field.

There are two reasons for introducing machines into the office: The first is to streamline processes, and the second is to improve one's ability to compete.

Over the years, the data processing field has been concerned with the streamlining of processes — improving the handling of high-volume transaction-based systems, reducing the cost of maintaining large files, speeding up the production of reports and similar activities. Conversion of such activities to machines produces measurable, predictable

Continued on page 21

Connell is executive director of the Office Technology Research Group, headquartered in Pasadena, Calif.

THE ONLY SYSTEM IN THE OFFICE WE CAN'T ACCESS.

You don't have to put *every* system in your office, factory or lab on a network.

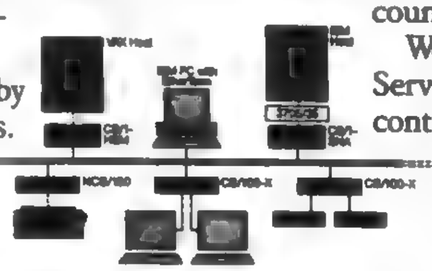
Just most of them.

And the more kinds of equipment you have, the more you need Bridge.

We network more systems from more vendors than anybody.

Our CS/1-SNA Communications Server lets async terminals talk to IBM® hosts by making them look like 3278s.

Our CS/1-HSM lets you get into a VAX™ minicomputer without a whole lot of cards and cables.



Thanks to EtherTerm,™ we can turn IBM® PCs into async terminals and link you up to any device on your network.

And our Gateway Servers hook up all your networks. X.25, broadband and Ethernet. Across town or across the country.

We even have Management Servers to help you configure, control and monitor your entire network from any terminal.

But don't take our

Datapro poll clarified

I would like to clarify some points in the article "Poll shows mini mart saturated" [CW, July 22].

According to Mary Hemingway, managing editor of Datapro Research Corp., the survey was not given to all minicomputer manufacturers simply because they produce minicomputer systems. The criteria used for selecting minicomputer manufacturers was based on hardware technology and target markets.

Motorola/Four-Phase Systems, Inc.'s 4000 and 5000 series have traditionally been targeted at the distributed data processing market. The company had not announced any new minicomputer hardware technology recently. Therefore, Datapro did not feel that Motorola/Four-Phase matched the selection criteria.

Datapro classified the Motorola/Four-Phase 2000 and 6000 series as superminicomputer systems, and thus these did not match the selection criteria as well.

It appears that the elimination of Motorola/Four-Phase from the survey was based solely on Datapro's survey objectives and not on the viability of the minicomputer systems.

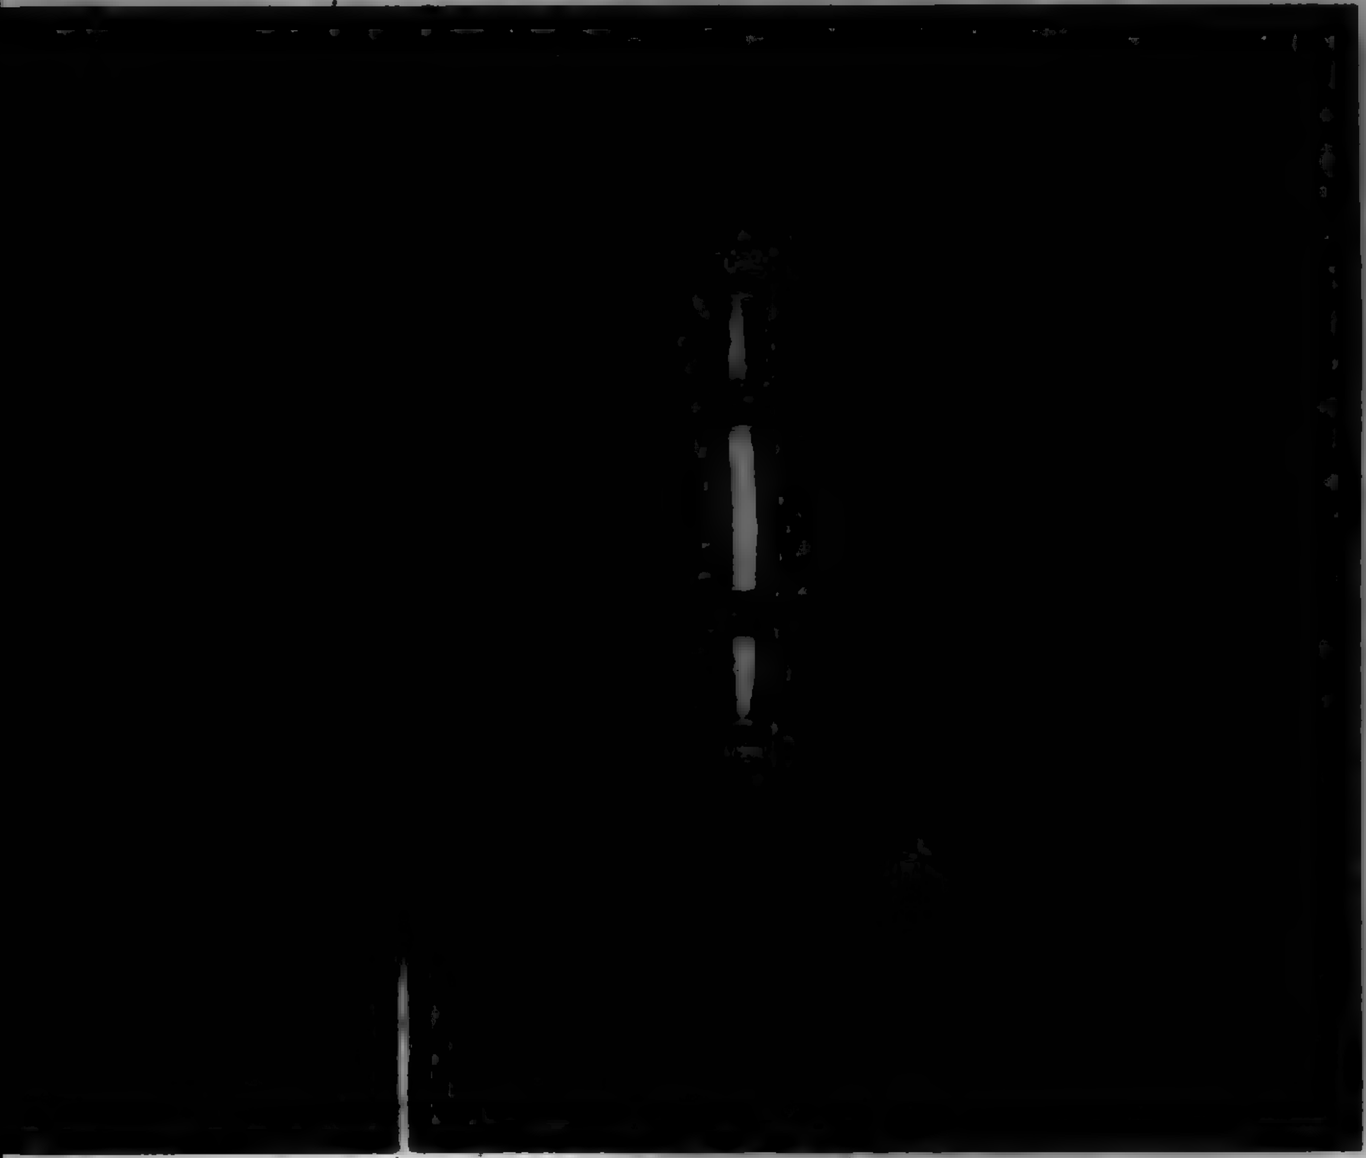
Howard Amundsen
Cupertino, Calif.

Publisher lauds vendor

A reader might infer from the article, "Switch to in-house data base musters interest in DSS" [CW, June 24] that Thomas Publishing Co. is unhappy with its service bureau vendor, when actually the opposite is true.

For the past 13 years, our vendor, International Computaprint Corp. (ICC) of Fort Washington, Pa., has consistently provided excellent service and continues to give valuable guidance in automating our operations. In fact, ICC has assisted us immeasurably in our efforts to perform work in-house, and it will continue to perform many other functions for Thomas that it alone does best.

Albert W. Klein
New York



word for it. Ask us to demonstrate it for you.

And while you're at it, let us bring you up to speed on our performance.

Our Communications Servers transfer over 200 packets a second. Our Gateway Servers do over 350 packets a second.

Your wish is our command.

Our user interface works just the way you'd expect it to work.

It's easy, logical, complete.

It's simple to change parameters, display statistics, execute command macros, broadcast messages anywhere on your network. Anytime.

And if you ever get into trouble, a single keystroke gets you "Help." Over a hundred commands will come to your rescue.

If you're looking for one network that can handle virtually every connection in your plans, call us at 415-969-4400. Or write Bridge Communications, 1345 Shorebird Way, Mountain View, CA 94043.

We'll show you how to keep all the equipment in your office on tap.

Bridge COMMUNICATIONS INC.

From page 20

Today's managers facilitate change

gains with low risk of failure.

Return on investment is not easily measured, and risk is high. Yet it is these investments, ultimately, that determine the fate of an enterprise. One can be streamlined to the nth degree and still fail if the right competitive investments are not made.

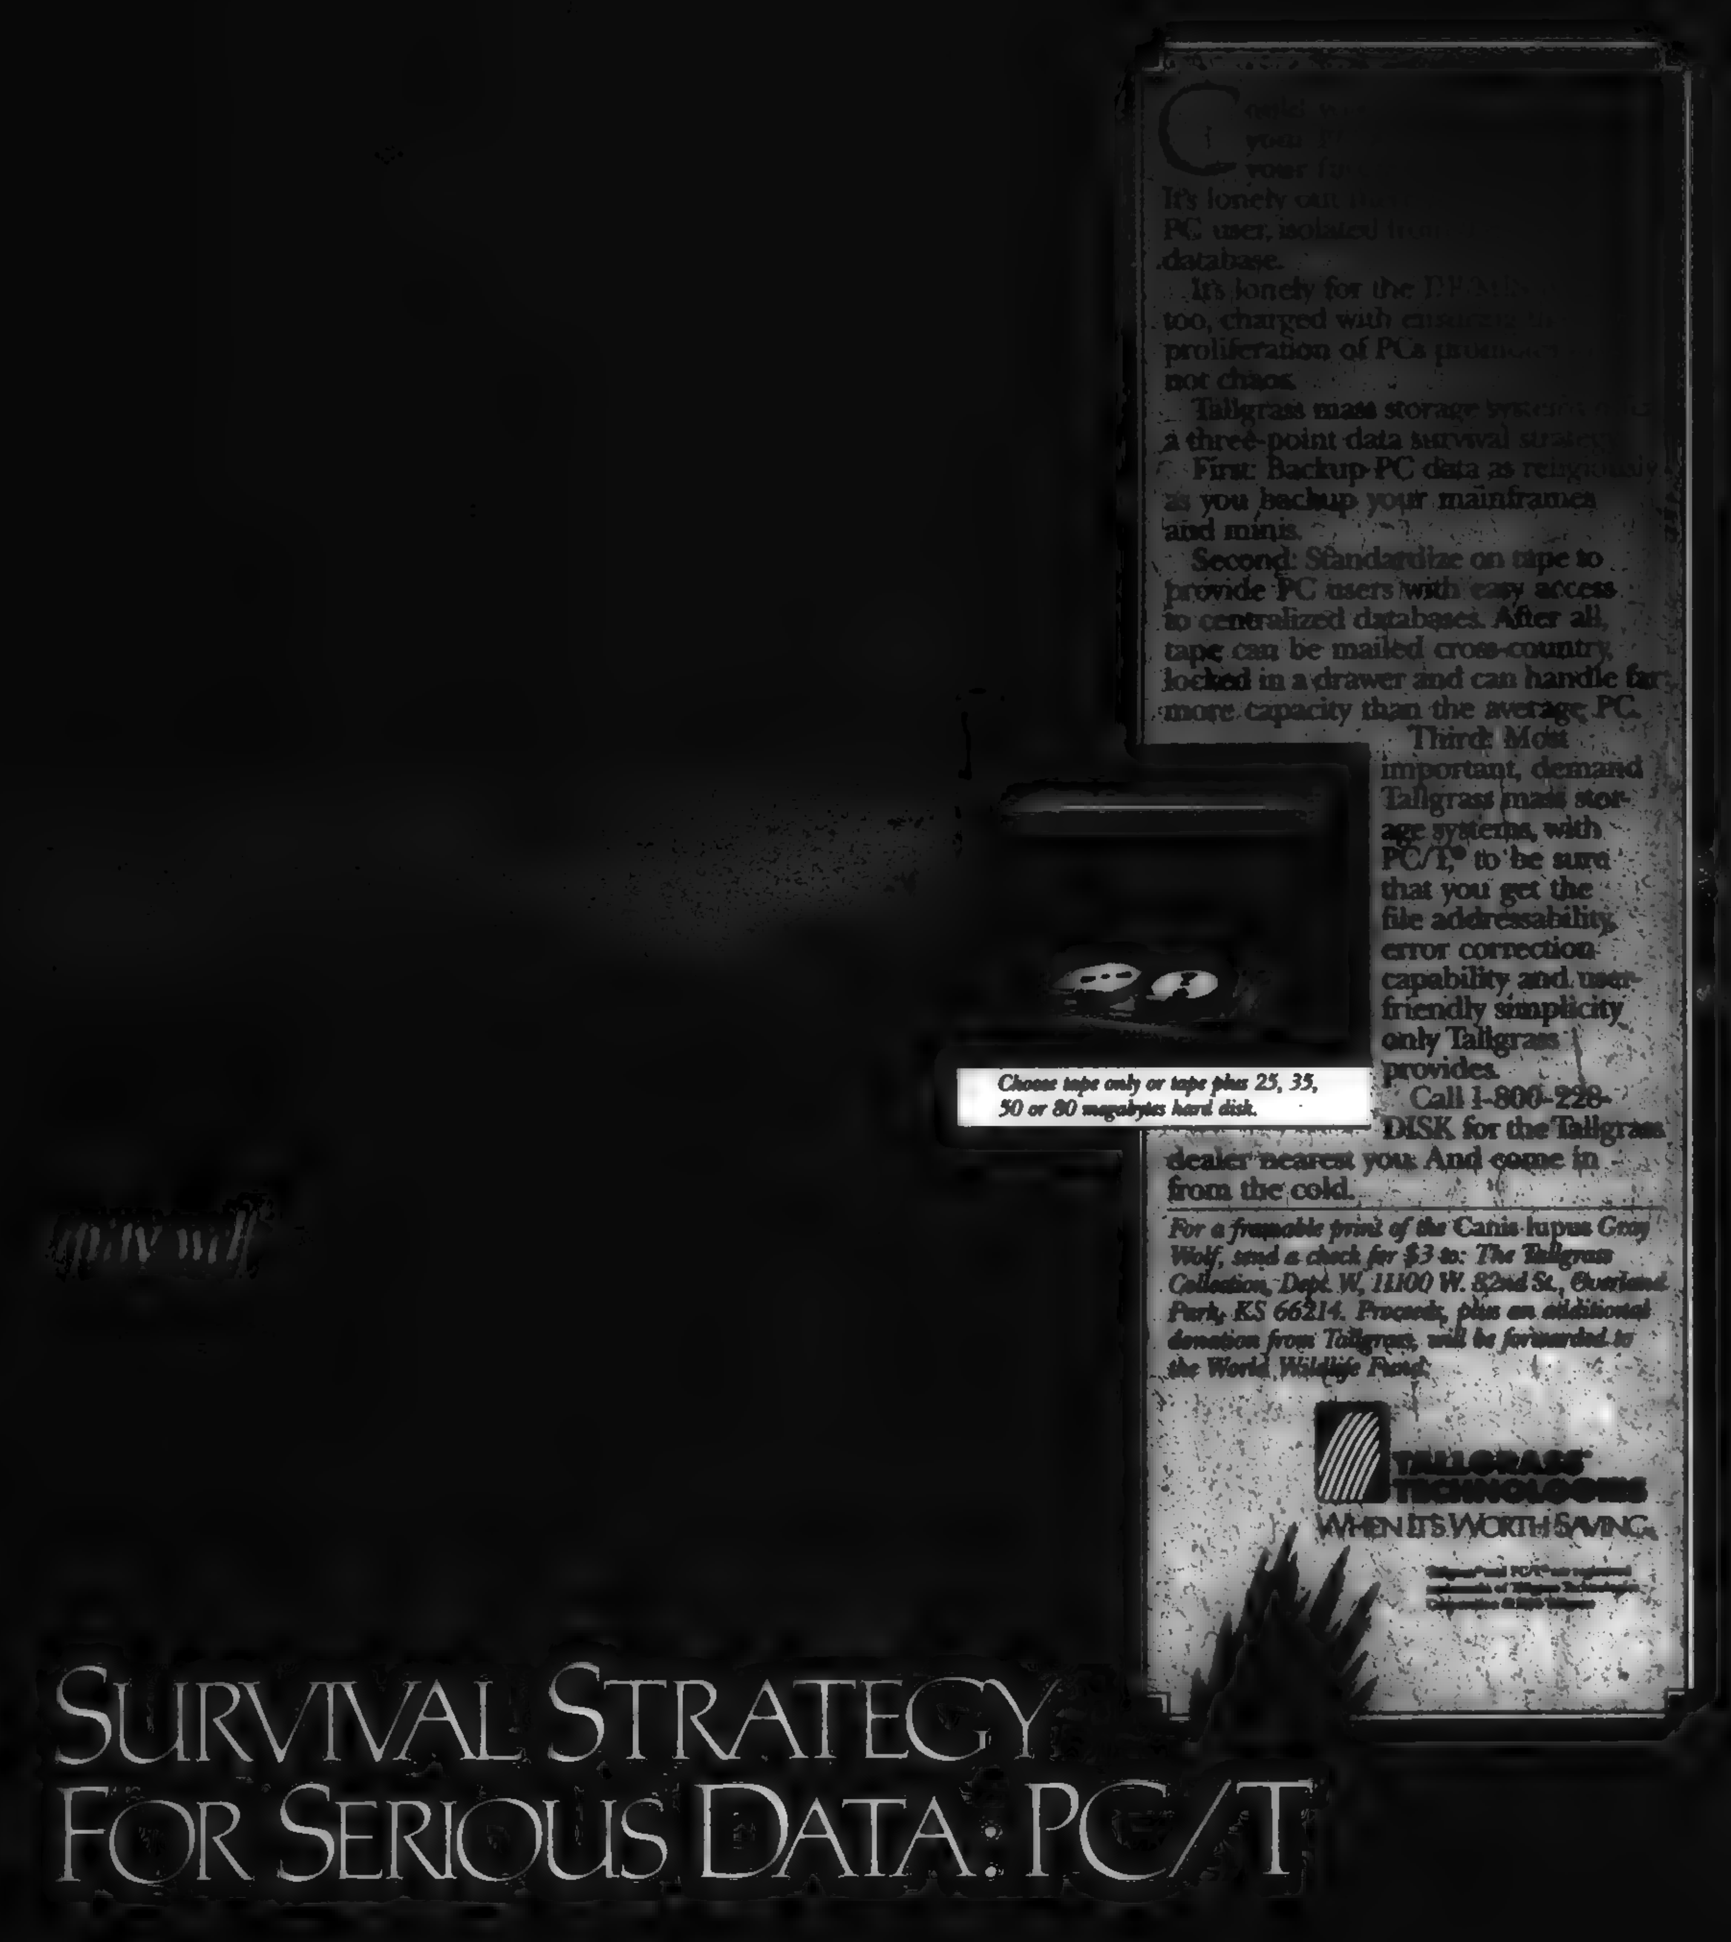
In this light, then, what is the new role of information technology professionals, MIS managers and the like? Their role is to make it happen and to provide an operating and technological atmosphere that supports the move of technology out into the workplace. This constitutes the new role of MIS professionals — facilitators rather than the exclusive providers of services.

In fact, some corporations have already responded by splitting their MIS organizations into two groups: One group aggregates all functions concerned with the operation of large, transaction-based processing systems and the maintenance of central data bases. The other group aggregates all activities concerned with moving technological capabilities out into the workplace. The managers of both are equal in rank and stature.

Change is never easy. Coping with major changes in direction, job content and career paths is doubly difficult. Couple that with a world that is exploding with new technological developments, and the situation becomes almost impossible.

Every change, however, represents an opportunity. Investments in advanced office systems will produce a community of office workers who are comfortable with information technologies and are aware of their potential.

That knowledge will then be translated into new ideas and approaches for improving overall corporate performance. Rather than the resistance often encountered in the past, MIS professionals will find themselves hard-pressed to keep up with this knowledgeable user community, and the challenge of their profession will grow immeasurably.



C[illegible] your [illegible] your [illegible] It's lonely out the[illegible] PC user, isolated from [illegible] database.

It's lonely for the DP/MIS [illegible] too, charged with ensuring [illegible] proliferation of PCs promotes [illegible] not chaos.

Tallgrass mass storage systems offer a three-point data survival strategy.

First: Backup PC data as religiously as you backup your mainframes and minis.

Second: Standardize on tape to provide PC users with easy access to centralized databases. After all, tape can be mailed cross-country, locked in a drawer and can handle far more capacity than the average PC.

Third: Most important, demand Tallgrass mass storage systems, with PC/T,® to be sure that you get the file addressability, error correction capability and user-friendly simplicity only Tallgrass provides.

Call 1-800-228-DISK for the Tallgrass dealer nearest you. And come in from the cold.

Choose tape only or tape plus 25, 35, 50 or 80 megabytes hard disk.

For a framable print of the Canis lupus *Gray Wolf, send a check for $3 to: The Tallgrass Collection, Dept. W, 11100 W. 82nd St., Overland Park, KS 66214. Proceeds, plus an additional donation from Tallgrass, will be forwarded to the World Wildlife Fund.*

TALLGRASS™ TECHNOLOGIES
WHEN IT'S WORTH SAVING.

SURVIVAL STRATEGY FOR SERIOUS DATA: PC/T

Integration under MVS/XA forecast for IBM line

By Donna Raimondi

IBM will adopt an integrated architecture across its extensive product line that will function under its MVS/XA operating system, according to a recently published report.

A heavy dependence on IBM's VM/CMS environment will provide interface capabilities for end users, according to "Inside Sierra," the report produced by Applied Management Services, Inc. of Patchogue, N.Y.

Within five years, the MVS/XA operating system will be modified to minimize user compatibility and migration problems, the report said.

The report examined IBM's Sierra announcement as part of an effort to provide data processing managers with an in-depth technical and managerial briefing on the 3090 (Sierra) systems. IBM's 3090 Model 200 and 400 announcements last February are the most significant factors contributing to the planning concerns of IBM mainframe users, the report said.

Since the 3090 announcement, high-end 3080 users have feared being stuck with suddenly old and hard-to-sell 3080 machines, the report said. The overall message in the 3090 announcement was IBM's hope that users would continue to purchase 3080 series processors. Despite its claims to the contrary, however, IBM is moving away from the 3080 mainframe family.

Lesson learned from 4300, 3080 era

IBM learned a lesson during the 4300 and 3080 series era, when its announcements of the new systems destroyed 370 and 3030 series residual values almost overnight. To avoid doing that to the 3080 series, the company held back announcements on the 3090's actual capabilities, the report said. IBM also dropped prices on 3080 series machines to promote their purchase.

During the next 18 months, overall internal performance of the 3090 Models 200 and 400 is expected to increase by 20%, the report predicted. Main memory capacity will increase, while the cost per megabyte of that memory will be reduced. Applied Management Services expects IBM to announce three new 3090 models by mid-1986, including two single-processor models and one that is halfway between the Model 200 and 400 in price and performance.

The report advised users to heed the following critical migration issues in relationship to IBM's 3090 announcement:

- Consider that the 3080s cannot be upgraded to the 3090s.
- Plan a move toward MVS/XA if future plans include 3090 technology.
- Pay attention to the functional changes that the 3090 contains. The real system price/performance level may be more important than the million instructions per second rating.
- Note that the 3090 offers up to 2.9 times the scientific and engineering power of the 3081 Model KX.
- Analyze total combined life cycle costs, including maintenance, floor space, upgrades and future enhancements.
- Note that the purchase-to-rental ratios for the 3090 series are extremely low — at unprecedented levels for IBM.

> "
>
> *During the next 18 months, overall internal performance of the 3090 Models 200 and 400 is expected to increase by 20%.*

- Strive to formulate 3080 vs. 3090 plans as quickly as possible.

Plug-compatible manufacturers (PCM) have suffered in the past few years from user loyalty toward IBM, the report continued. National Advanced Systems Corp. (NAS), however, responded to the 3090 announcement so swiftly with its family of AX/SL mainframes, manufactured by Hitachi Ltd., that it may make inroads with users who do not want to wait until 1987 for the 3090 Model 400.

NAS offers better delivery schedules, more competitive price structures and more advanced technologies than IBM in this case, the report said. Even the most conservative of large IBM users may find it difficult not to take advantage of the NAS mainframes, it said.

IBM, however, has seriously cut into the PCMs' market share with hints of a new modular MVS/XAA operating system that will not run on PCM equipment, the report said. The XAA concept centers on the implementation of microcode support, or assists, to the XA capability.

The PCMs' market share has dropped from 6% in 1981 to 4.5% at the end of 1984. As IBM moves closer to attaining the XAA microcode, the PCMs will be in for an even tougher time, the report said.

The report, which costs $120 per copy, is available from Applied Management Services.

After September 16, what will you do with your IBM Personal Computer AT™?

WASHINGTON UPDATE
CW Washington Bureau

OTA to study computer security, privacy issues

WASHINGTON, D.C. — The U.S. Congress' Office of Technology Assessment (OTA) recently announced plans to conduct a study of computer security and privacy issues.

The study, tentatively titled "New Communication Technologies: Implications for Privacy & Security," will delve into the following topics:

- Current technologies for monitoring the work of government and business employees, as well as technologies being developed that are likely to intrude on workers' privacy.
- The methods for mitigating the privacy threat of work monitoring through technology, legislation, labor agreements or other means.
- The ways in which computer systems can be misused or exploited by interception of data signals, unauthorized access and other means and the availability of security measures now and in the future.
- Case studies of specific computer systems whose disruption would be significant to the public or the economy.

GAO reports find federal payment systems faulty

WASHINGTON, D.C. — Several U.S. agencies often pay contractors twice for their goods and services, in part because their automated payments systems fail to stop the issuance of duplicate checks, according to three investigative reports by the U.S. Congress' General Accounting Office (GAO).

Recent GAO studies discovered more than $11 million worth of duplicate payments, the largest involving a $6.8 million payment that was mistakenly sent twice to a contractor for the Defense Logistics Agency.

Errors often occur when contractors send two or more invoices to the government; usually the contractors return the overpayments, the reports said. But the GAO identified several problems with the automated payment systems, including the following:

- A U.S. Department of Justice system "did not reliably identify duplicate payments, and it required action by payment center staff to stop those it did detect."
- The system at a General Services Administration office identified duplicate payments but only after the final computer tape for issuing checks had been made.
- A Defense Logistics Agency office sometimes paid contractors twice, once manually and once through the automated system, because the manual payment was not recorded.

ICCP announces certifying exam

DES PLAINES, Ill. — The Institute of Certification of Computer Professionals (ICCP) has announced the Associate Computer Professional exam, a certification program for computer professionals who have graduated with degrees in computer science or who have equivalent experience.

The certification requires passing a two-part examination. The language portion tests a person's knowledge of Cobol, Fortran, Pascal, C, RPG or structured Basic. The second portion examines a person's knowledge of data and file organization, principles and techniques of programming, interaction with hardware and software, quantitive techniques and systems analysis and interaction with people.

For more information, ICCP is located in Suite 268, 2200 E. Devon Ave., Des Plaines, Ill. 60018.

WHAT IF YOUR TRANSACTION RATE DOUBLES?
WHAT IF YOU INSTALL A NEW CPU?
WHAT IF YOU USE MORE DASD?

MAP Amdahl's Modeling and Analysis Package, is a fast, powerful, and economical way to answer your "What if...?" questions.

You may use MAP to

- model an entire computer system and its various workloads.
- forecast the effects of workload growth, upgrades, and configuration changes on system performance.
- predict response time and device utilizations, as well as residence times, queue lengths, memory utilization, paging and swapping activity, and I/O path contention.
- automatically process SMF/RMF data to generate models for MVS/XA and MVS/370 environments by using OBTAIN, a built-in data reduction utility.

With MAP, you can make informed choices as you plan and manage the growth of your computer systems.

WHAT IF YOU NEED TO ADD OR MODIFY APPLICATIONS IN IMS?

Here the tool to use is Amdahl's SURF/IMS (System Utilization Reporting Facility/IMS).

Rather than building a mathematical model, as MAP does, SURF/IMS constructs a synthetic application program and runs it like a real production application. You can observe the impact of various configurations as the program runs.

SURF/IMS helps you manage an entire IMS/ VS environment.

For more information about MAP or SURF/IMS, complete and mail the coupon below, or call 800-227-1817, extension 44.

Please send me information about software productivity tools from Amdahl.
I'd like information on ☐ MAP ☐ SURF/IMS ☐ both products.

Getting spreadsheets, word processing, graphics, communications and the IBM PC to work together can be tough, too.

If you think solving the federal budget deficit poses a challenge, you haven't tried getting a company's personal computers under control.

When you do, you'll find that most users require different configurations to handle their various computing needs. And while there are plenty of hardware and software products that perform well, they don't necessarily perform together.

Enter DunsPlus. A combination PC product and service that brings a new level of integration and cooperation to the IBM PC, software, communications, user education and services.

DunsPlus offers you the choice of any IBM PC, already configured with proven software programs like 1-2-3 and MultiMate or DisplayWrite word processing. It also includes software tools for data integration, file management, micro/mainframe communications, and systems development.

Unlike static integrated products, DunsPlus has the flexibility you need to add software to its consistent, easy-to-use, menu-driven operating environment.

And it's backed up with comprehensive education programs and support services.

DunsPlus. Like NOMAD, now NOMAD2, the premier 4GL/DBMS, it's one in a continual evolution of computer software services from Dun & Bradstreet.

To assure that your PC products work together, write DunsPlus, 187 Danbury Road, Wilton, CT 06897 or call 800-DNB-PLUS.

DunsPlus

We make PC products work the way they should. Together.

WORLD DIGEST

CW International News Network

NORTH ROCKS, Australia — Rexona Pty. Ltd., a subsidiary of the Unilever Group, has obtained the first Australian license for Cincom Systems, Inc.'s Ultra Mantis fourth-generation operating system. John Greenlees, information services manager for Rexona, said the company chose Ultra Mantis to run on its Digital Equipment Corp. VAX 11/780 "because the systems are data driven."

■

COBURG, Australia — Kodak Australasia Pty. Ltd. will install data base and development tools from Applied Digital Research, Inc., (ADR) in keeping with Kodak Corp.'s mandate to standardize its organization's software worldwide. The ADR products — Datacom/DB, Datadictionary, Dataquery and Ideal — were chosen after an evaluation by a multinational task force commissioned by Kodak's Information System Management Council, a group of senior DP managers from Kodak's eight main DP installations around the world.

■

BROADMEADOWS, Australia — Ford Motor Co. of Australia Ltd. has signed a $7.5 million contract with Burroughs Corp. Industry insiders said it is the first of two such orders Ford will tak this year to cope with on-line real-time data base software development. The company will become the second Australian user of Burroughs' A 15 mainframe. Ford of Australia now uses dual B7900s, dual B7800s and an A 9 mainframe. The Ford of Australia contract calls for three subsystems of Memorex Corp. B9494-12 thin-film head disk assemblies.

■

HONG KONG — Stockbroker James Capel has placed a computer systems order worth $2.26 million with Hong Kong consulting company CCF Ltd., whose Fiscal package will be used on the central shared resource computer facility in the stockbroker's Exchange Square complex in Hong Kong. In London, however, Capel will install the software on a 150-terminal Ultimate Corp. system, which is considered one of the largest of its type in the world. The company is the first in Hong Kong to buy CCF's Fiscal International software. It will use 10 lines connecting its office to the Exchange Square system to service Capel's activities in Hong Kong, Tokyo and Singapore.

The CCF Fiscal software will provide settlement, valuation and fund management for its London, New York and Channel Islands, UK, offices. The London installation is valued at $1.76 million and will be based on Ultimate-/Honeywell, Inc. processors with 2M bytes of main memory and 2G bytes of disk storage. The system's 150 terminal devices will include laser printers and IBM Personal Computers, a company spokesman said.

■

HONG KONG — The Royal Hong Kong Jockey Club (RHKJC) is spending $5 million to train its staff as part of an office automation project with Digital Equipment Corp. The RHKJC is currently DEC's largest customer site in Asia with over 7,000 terminals and other peripheral devices to support its gambling operations. More than 100 of the club's off-track betting centers, plus a computerized telephone betting system serving 300,000 customers, are supported by some 110 VAX and PDP-11 computers. The RHKJC was also the first Asian site for DEC's high-end Venus system, according to a company spokesman.

■

HONG KONG — Smaller hotels in the Hyatt Regency chain, including one on the Pacific Ocean island of Saipan, plan to install a financial management system developed in Hong Kong. Hyatt hotels in Indonesia; the Philippines; Dubai, U.A.E.; Fiji; and New Zealand are expected to install FMS/PC, the multicurrency package launched in March by Hong Kong-based software house RCP Consulting Ltd. The package is a microcomputer version of RCP's Hotel Accounting System for minicomputers.

■

HONG KONG — Technical trials for an integrated services digital network, capable of carrying data, text and color-image communications, are scheduled for later this year by the Hong Kong Telephone Co. The territory's 66 telephone exchanges will all have digital switching by 1988.

■

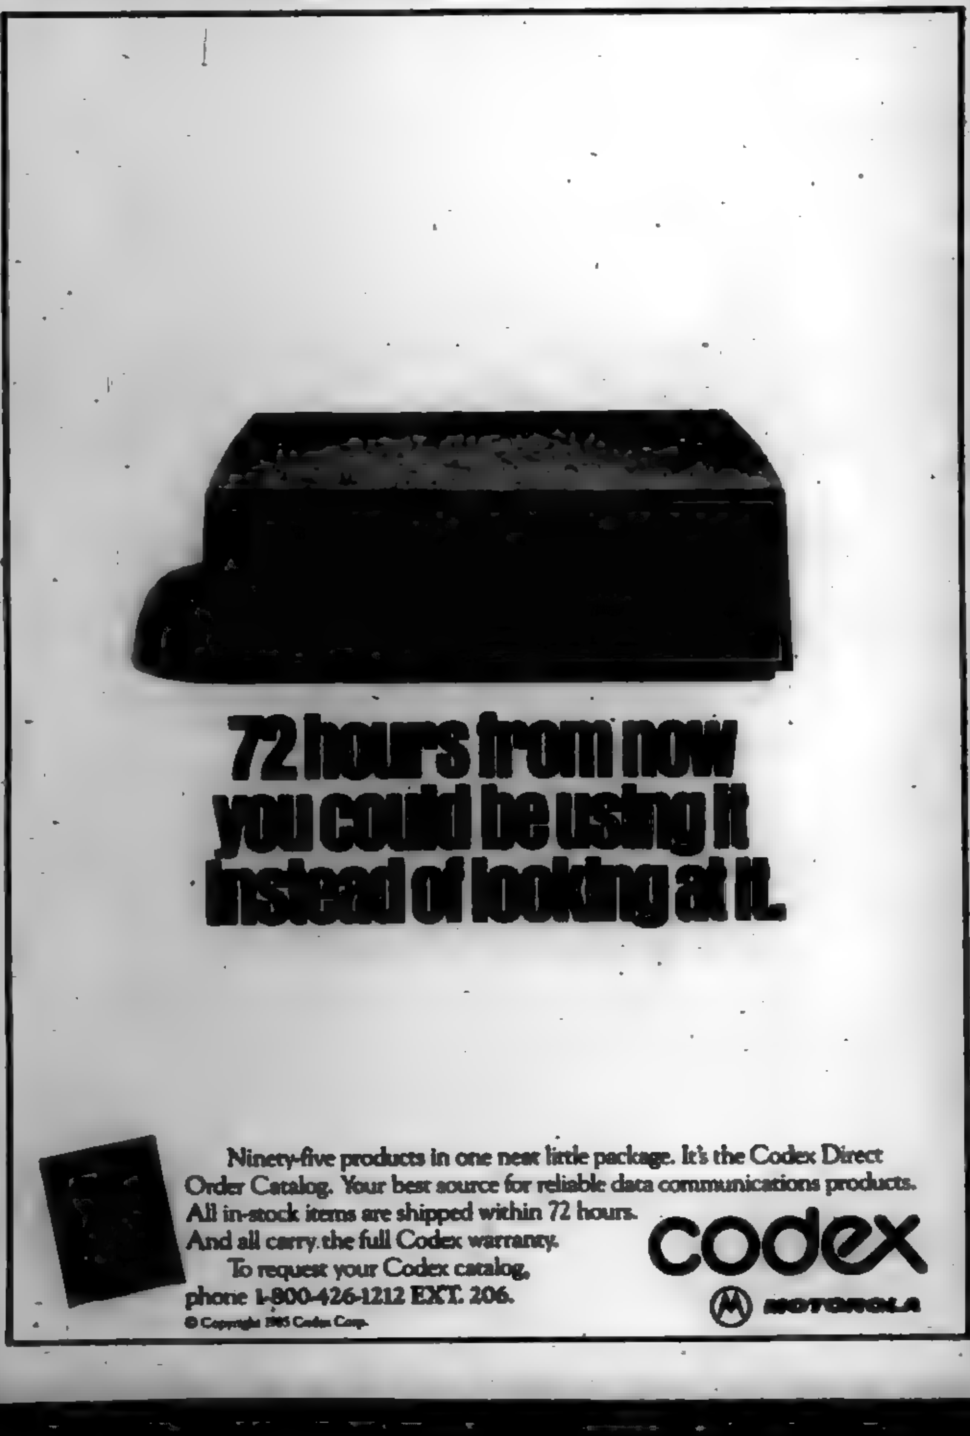
OSLO — The Osborne label will reappear on computers, but the new IBM Personal Computer XT-compatible Osborne system will be available only in Norway, it was learned. The Norwegian computer distributor, Nor Sales, was extremely successful three years ago with the original Osborne Computer Corp. portable computer.

When Osborne ended operations in the U.S., Nor Sales sold off the machines at low prices. The new "Norwegian" Osborne 20 XT is actually a U.S.-made Tandon Corp. computer, selling for about half the price of an IBM Personal Computer XT.

■

STOCKHOLM — Losses incurred by its personal computer division in the U.S. market are being blamed for Ericsson Information Systems, Inc.'s (EIS) recent financial woes. EIS invested heavily to penetrate the U.S. market but had very poor results, sources said.

Estimated sales for this year were reduced from 15,000 units to 6,000, and EIS has been forced to cut the micro's price by 15% to 20%. Ericsson recently reorganized its Information Systems division, reduced personal computer production and may relocate its manufacturing unit.



72 hours from now you could be using it instead of looking at it.

Ninety-five products in one neat little package. It's the Codex Direct Order Catalog. Your best source for reliable data communications products. All in-stock items are shipped within 72 hours. And all carry the full Codex warranty.

To request your Codex catalog, phone 1-800-426-1212 EXT. 206.

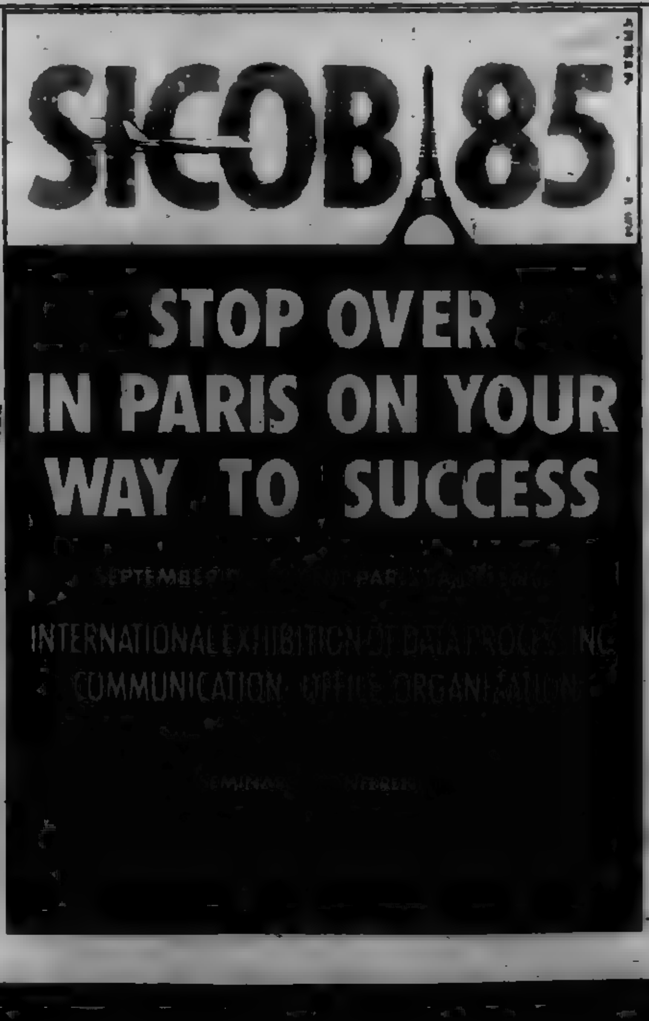
MOTOROLA



SICOB 85

STOP OVER IN PARIS ON YOUR WAY TO SUCCESS

SEPTEMBER [illegible] PARIS [illegible]

INTERNATIONAL EXHIBITION OF DATA PROCESSING
COMMUNICATION · OFFICE ORGANIZATION

SEMINARS [illegible]

INTRODUCING THE ONLY COMPUTER YOU MAY EVER NEED.

THE NCR PC6.

Computers cost too much to be short-lived office machines. They should be long-term business partners. With features that are expandable, not expendable.

If you've got a permanent position to fill, call in the NCR PC6.

IT'LL DO WHATEVER YOU WANT IT TO.

Choose from nearly 10,000 IBM-compatible business programs: Lotus 1-2-3,™ Symphony,™ WordStar,® even Frogger.™ The PC6 runs them at the blazing speed of 8 MHz—nearly twice as fast as ordinary computers. Shift to a leisurely 4.77 MHz and it runs programs high-speed-only machines (like the IBM PC AT) can't—from modem communications to flight simulations.

And no other PC comes better prepared for more memory, multitasking, and applications yet to be invented. Because no other PC comes with more expansion slots (eight in all).

YOU CAN PUT A LOT INTO IT.

The PC6 can be upgraded to hold 10, 20, 30, up to 40 megabytes of information. Enough space for 7,575 typed pages (the size of some other computers' instruction manuals).

IT INSURES AGAINST LOSS.

Important data—from invoice records to clients' birthdays—can be backed up with a streaming tape. You can record up to 27 floppies onto a cartridge no larger than a credit card. And since the tape's built-in, it's less susceptible to coffee spills and spiked heels.

IT'S A PLEASURE TO WATCH.

The PC6's 640 x 400 screen gives you twice the resolution of other computers running IBM-compatible software. So characters are sharper. Colors richer. It can turn the dreariest of spreadsheets into a feast for the eyes.

And wherever your business goes, NCR is there. With 1,200 service support offices in 120 countries.

Examine other PCs, regardless of price. You'll find that none of them comes closer than the PC6 to being the only computer you'll ever need.

It should be the last comparison you'll ever need.

For your nearest NCR dealer, call toll-free 1-800-544-3333.*

Support loss forces replacement

COLUMBUS, Ohio — It was a nightmare that every computer user dreads: A vendor halts support of a critical system, and the application is sufficiently esoteric that an alternative is not readily at hand. Not a moment can be lost, and the ensuing scramble involves not a little bit of risk.

For the Chemical Abstracts Service (CAS), a division of the American Chemical Society based in this Midwest capital, the system involved consisted of Conographic 9 terminals from Hughes Aircraft Co., used in publishing the CAS 77-year-old weekly journal, *Chemical Abstracts.*

"The vendor had withdrawn support of the product, and we were having trouble finding replacement parts," said Hans Dreyer, system engineer at CAS.

Chemical Abstracts contains summaries of chemistry articles, professional papers, chemical patents and reports.

The abstracts act as research sources for chemists, engineers, scientists, students and professors and often are accompanied by drawings of complex chemical structures and chemical and mathematical equations.

CAS requires graphics terminals like the Conographic 9 system because complex chemical structures and equations must be displayed on a screen exactly as they will appear in print in *Chemical Abstracts*, Dreyer maintained.

"If a mathematical symbol is to be printed twice as large as another, the two symbols must appear in proportion on the display screen," he said.

The terminals are connected to two Digital Equipment Corp. PDP-11/24 series minicomputers that are connected to an IBM 370 mainframe that controls data entry and phototypesetting operations.

Vendor support withdrawn

Hughes withdrew from the terminal market support, and CAS found itself without vendor support. Dreyer's group was responsible for scurrying to find a replacement. "We evaluated terminals from a number of manufacturers," he said.

CAS chose four Vistagraphic 1000 display terminals from Calcomp, an Anaheim, Calif., firm. With this system, whenever an image was altered by the operator, the change was seen on the screen instantly.

CAS needed this capability in publishing *Chemical Abstracts*, because large amounts of information were constantly altered.

The new terminals provided other benefits as well. "The old terminals had to be reinitialized from time to time to clear the screens because storage tube technology sometimes leaves traces of previous images on the terminals," Dreyer explained. This procedure was not necessary with the new terminals.

Magazine reproduction was not the only use that CAS made of the abstracts. They are also available from an on-line data base, a cumulative index for *Chemical Abstracts* that CAS publishes every five years.

The index is so large that it has earned a place in *The Guinness Book of World Records.* The 1983 edition, for example, contained more than 130,000 pages and 25 million entries in 75 volumes.

Looking for a workstation tool with the power of RAMIS® II and the friendliness of a PC?

Martin Marietta Data Systems introduces UNISON,™ the first workstation tool to combine the ease of use of a PC with the mainframe power of RAMIS II – the most comprehensive, widely-used 4GL product ever created.

UNISON is not just downgraded mainframe software. It was designed specifically for the PC environment. With such easy-to-use features as windowing, menu assistance and full HELP facilities. It lets you use popular software like ITSoftware,™ Multimate™ and Lotus 1-2-3.™ And helps these different products work better together.

Even more important, UNISON lets you go back and forth between PC and mainframe. Not only can you access mainframe databases and electronic mail directly with UNISON, you can share processing tasks between micro and mainframe.

UNISON is another of Martin Marietta's Natural Selection™ products – an interrelated family of products designed to work with an extraordinary variety of machines, environments, applications needs and degree of user sophistication.

If you thought you'd never find a workstation tool as easy to use as a PC and as powerful as a mainframe, you're in for a nice surprise.

It's ready now.

Martin Marietta's UNISON.
We're ready now.

370 computer companies have discovered the secret to building some of the world's most advanced printers.

Distributed processing system remedies hospital's ills

CHICAGO — Despite an ailing DP budget, a major hospital here implemented an information center and distributed processing technology with the hopes of nursing its report delivery system back to health.

When the manual system for delivering user reports throughout the sprawling 28-building South Side campus of Michael Reese Hospital & Medical Center reached capacity, Bill McNichols, the hospital's technical services manager, realized something had to be done.

"It became clear that we could not support our growing user base with one or two report deliveries per day like we did with our batch processing customers," McNichols said. "Users were going to need documents, memos and graphs on demand."

With the data center more than a mile away from some of these buildings, McNichols continued, "you can guess how many users were willing to make the trip over here just to pick up a report."

The hospital uses low-cost dumb terminals as user workstations with its IBM 4341 Group II mainframe running VM/CMS. Printer requirements, however, threatened to limit the network's effectiveness.

"We wanted to produce software tools that would emulate micro tools," McNichols said. Even with terminals in several work areas there was little printer support.

"We were trying to foster the use of productivity tools for office automation within the department," McNichols said.

Managing resources difficult

The hospital used IBM's DCF and GML for text processing and SAS Institute, Inc.'s SAS/Graph for presentation graphics and reporting. According to McNichols, this range of products created a big demand for small, specialty printers. "Once we got three or four different printers and 15 to 20 people using them, managing those resources got to be very difficult."

The printers were simply defined to Remote Spooling Communications Subsystems (RSCS), the spooling subcomponent of VM.

RSCS was a headache for the DP staff, McNichols said, because central systems operators had to leave the command room to go reset the printers numerous times per day.

The hospital wanted to be able to share work loads between printers and send reports to a list of printers. "RSCS could not help us accomplish these goals," he said.

Michael Reese Hospital now uses the ACX-PM Printer Manager from Autovative Computer Extensions, Inc. in Downers Grove, Ill., to support a network of printers. Included are Ascii printers connected to asynchronous communications lines.

Among the early users of the ACX-PM network were the Medical Center's clinical departments. Ascii terminals and printers were already in use, and the users were anxious to access the central computer for word processing or for developing departmental systems, McNichols said. ACX-PM allows users to connect to the host and control printer output.

A recently developed system that supports the Development Office allows users to print various types of forms, including letterhead stationery and envelopes on a Diablo Systems, Inc. 630 printer.

ACX-PM is built into the system and appears transparent to the user. Now, printers can be shared between different applications.

There are plans to continue the spread of low-cost printer devices within the institution.

"We're looking at the possibility of adding some new function to our Payroll/Personnel system by making the screen-image printers more versatile," McNichols said. "It will surely help get information to the user more quickly."

Stiff competition presses winery into use of graphics

System aids planning effort

SAN FRANCISCO — When prohibition confronted one Northern California wine company with the sour grapes of public opinion, the company made grape juice. Today, that winery is adapting again to outside influences, this time with computer graphics.

Italian Swiss Colony Wines of California, Inc., the country's fourth-largest wine maker, has been producing wine since the mid-1800s. The company reports annual sales of seven million cases of wine in the U.S. and 10 foreign countries, from its product line of dry table wines, dessert and fortified wines, sparkling wines, brandy and vermouth.

During the past three years, the firm and its products have faced an unusually competitive business climate. Foreign wines, which cost less to produce than domestic ones and sell for less despite import tarriffs, are hurting U.S. producers' sales, according to Bill Hardwick, a business analyst for Italian Swiss Colony. In addition, he said, the wine industry has been relatively stagnant for the past two years, so domestic companies are battling each other to increase their market shares.

Italian Swiss Colony has responded to business pressures with tight control and planning measures, some of which rely on effective use of computer graphics. The firm employs an IBM Personal Computer, Lotus Development Corp.'s 1-2-3 software and Hewlett-Packard Co.'s HP 7470 two-pen graphics plotter to produce charts and graphs that managers use to help them with business decisions.

Daily order report

Hardwick said the graphics application on which the firm's managers rely most heavily is a daily order report that he produces for them. Graphs included with the report show how many cases Italian Swiss Colony's distributors ordered the previous day and compare these numbers with the company's sales forecasts.

"These updates are necessary for quick assessments of our position and [for] decisions made between . . . business meetings," Hardwick said. He produces the reports by entering order statistics into the Personal Computer, filling in a Lotus worksheet, converting the information to a chart format, reviewing the chart on his screen and outputting the graphics to the plotter.

Hardwick's finished reports have numerical data on one side and charts on the other. Many managers prefer the graphics side, he said, because it gives them information at a glance.

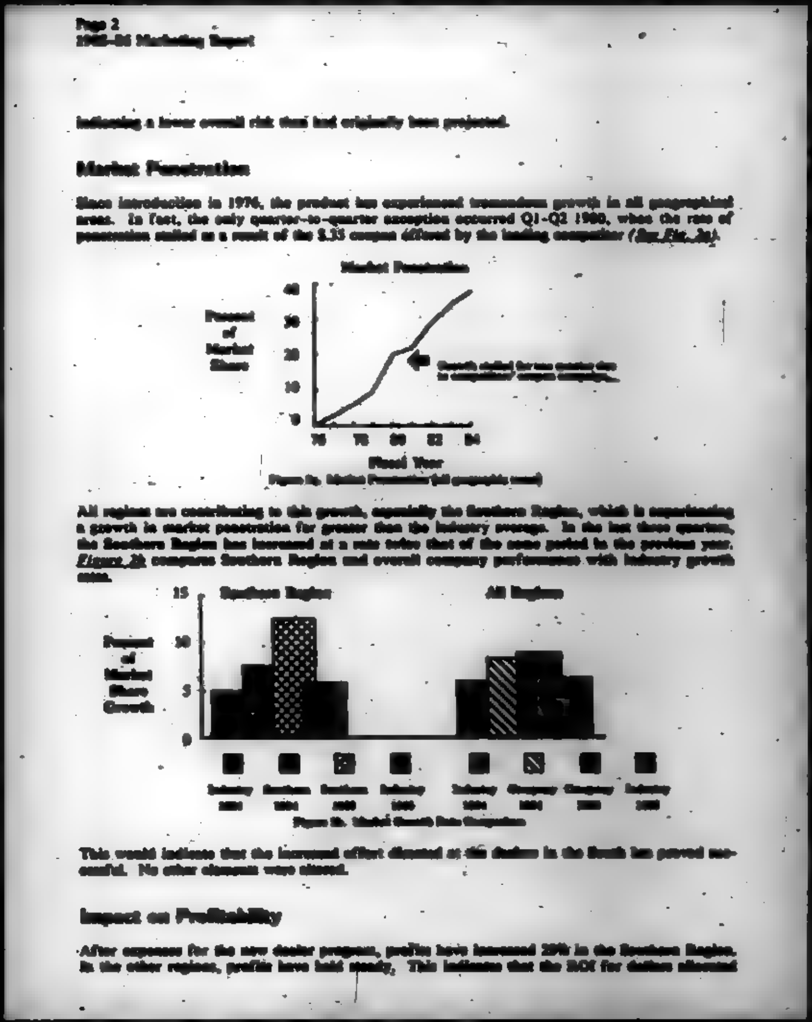
Because they are easy to understand, the charts help Italian Swiss Colony's managers make accurate business decisions. "The bar and line graphs generated by the plotter are much less confusing than columns of numbers," Hardwick explained. "The graphs decrease the possibility of misunderstanding information and, in doing so, prevent potential mistakes in decisions."

The wine maker also uses graphics in its monthly business meetings. Hardwick produces graphs that show year-to-date business figures, forecasts for the future and different brands' recent sales against previous years' sales. He has each graph made into a transparency that he uses to explain business results.

Before Italian Swiss Colony purchased its graphics plotter in October 1983, presentations at business meetings consisted of hard-copy output of raw data. "The method wasn't satisfactory," Hardwick said. "Trying to explain the numbers as they stood alone was too confusing."

The graphics presentations help managers get through business meetings and on to the business of producing wine, he said.

With the Hewlett-Packard LaserJet Printer.



LOSE FAT.

THE LEADER IN ON-LINE TRANSACTION PROCESSING INTRODUCES THE FIRST NONFAT DISC.

It's the first disc drive product specially designed for high-volume transaction processing. It's designed for fast response time, too, with eight simultaneous accesses in one cabinet. And it conserves your most expensive real estate—the computer room.

SMALL FOOTPRINT.
BIG SAVINGS.

In one of our typical database applications, five Tandem V8s provide 700 accesses per second in only 50 sq. ft. of computer room space. For the same job, the competition would have required 250 sq. ft., five times as much, plus an extra $146,000 in hardware.

The reason for the difference—disc fat.

To handle high volume, a database must be split up over several discs for simultaneous access. So with large, conventional disc drives, only a small portion of each disc gets used.

Not with the Tandem V8. We put data on small high density discs. The entire disc gets used. So, no disc fat.

EASY TO SERVICE.

With the Tandem V8, maintenance is easy too. Each disc drive can be removed and replaced in a few minutes. And the entire unit can stay on line even while it's being serviced.

THE NEW TANDEM V8.
For fast response time and high-volume transaction processing.

GROW MUSCLE.

THE LEADER IN ON-LINE TRANSACTION PROCESSING BEEFS UP YOUR BRANCH OFFICE.

Tandem extends its fault-tolerant line with a new low-cost system that's totally compatible with the more powerful NonStop TXP™ and the NonStop II.™ Its price and size let you put power where you need it—even a branch office or department copy room.

The NonStop EXT™ comes with enough muscle to support up to 100 terminals. So it takes the work load off the main host and serves as your local host. It also shares information in your corporate network.

The EXT is self-contained in one cabinet. Just wheel it in and plug it in. No additional air conditioning is needed.

It comes with enough expansion slots to double its processing power and quadruple its memory. You can also link two EXTs together if you need them. You can even team it up with the nonfat Tandem V8.

LET'S CHEW THE FAT.

Tandem systems are already at work for FORTUNE 500 companies in banking, telecommunications, manufacturing, transportation, retailing and energy, as well as several branches of the United States Government.

To find out what we can do for you, call (800) 482-6336. Or write for our annual report. Corporate Headquarters: 19191 Vallco Parkway, Dept. 762, Cupertino, California 95014.

THE NEW TANDEM NONSTOP EXT™

The low-cost extension to your network.

TANDEMCOMPUTERS

Disk drive eases computer game firm's system overload

PASADENA, Calif. — A computer game company here recently found itself in the unenviable position of having to turn away prospective business because its computer system could not handle the in-house load. The dilemma was resolved through the firm's adding a new disk drive and upgrading an old system, moves that also helped to increase productivity and cut costs.

Cheshire Engineering Corp., a small electronic engineering and computer science firm, found itself in a predicament last year when its Digital Equipment Corp. PDP-11/23 could no longer handle the company's development load, according to Larry Zwick, software design engineer and system manager.

The seven California Institute of Technology graduates who had launched the company in 1982 had chosen the PDP-11/23 because it was uniquely suited to a fledgling company's budget, Zwick said.

The computer's disk drive system combined an 8-in., 20M-byte Winchester with an access time of 60 to 70 msec and a floppy backup — a system that was inexpensive and reliable but offered neither high speed nor high performance.

Cheshire had three games on the market within a year and a half after its start-up, with two more under development. Also in the works were real-time control software products such as Vasi, a videotape recorder animation controller, and several other special applications systems including one to transmit a continuous loop program for a CATV network, according to Zwick.

Losing potential business

With 10 employees now up on its in-house system, the company found it was losing potential business because of system overload, Zwick said. In order to find the system's weak links, the staff performed a series of tests on the system that pinpointed the disk drive.

After surveying the marketplace, Cheshire settled on a 128M-byte Atlas disk drive with an access time of 18 msec, manufactured by Alpha Data, Inc., of Chatsworth, Calif., together with an Emulex Corp. converter.

At the same time, Cheshire added a Cipher Data Products, Inc. F880 streaming tape that operates at 100 in./sec. in 1,600 bit/in. mode and 50 in./sec. in 3,200 bit/in. mode and an Emulex controller.

Cheshire upgraded its PDP-11 by removing the 11/23 processor and adding an 11/73 .25M-byte processor board. A cabinet and power controller were also purchased, according to Zwick.

Overall time savings

"We estimate between 10% and 20% overall time saving per day per employee," said Will McCown, Cheshire vice-president and principal hardware engineer.

"This enables us to bid lower on new business proposals, charge clients less than our competitors and still increase our own profit margin."

Productivity is also up at Cheshire. "Before we acquired the new drive, the system would completely clog up during any payroll or financial work. What we call our real work — programming — as well as editing and word processing, would come to a halt," Zwick said.

More complete use

The staff at Cheshire is making more complete use of the computer's capacity now, Zwick said. Before upgrading, the staff went out of its way to avoid having to use the main system. They ignored mistakes or tried to remember where they were. Sometimes they resorted to writing down a catalog so they could feed in all the mistakes at once, he said.

Cheshire decided to run some tests to measure the improvement with the upgraded system, Zwick said. Using a time board, the staff measured when the computer was actually waiting for the disk, he added.

With the old system, it took 70 msec per average transfer. With the present system, it takes between 14 and 20 msec per transfer for a small number of blocks and 20 msec for a large number of blocks, according to Zwick.

Measuring daily backup time

Another test measured the time required to do the daily backup performed to save each day's work, Zwick said. This required more movement of the disk than most operations and involved bigger pieces of data. It took the same amount of time to back up the old disk as it did to back up the new one, but the new one was five times larger than the old one, according to Zwick.

He said the old disk was so slow that it could not keep the streaming tape in streaming mode, causing the backup to take a long time given the amount of data on the old disk.

"We may need more memory and a faster processor. But we will be able to keep the same disk drive, since we plan that it will serve up to 20 people easily," Zwick said.

Cheshire's system should serve for some time to come, according to Zwick. The PDP-11/73's .25M-byte main memory is now upgradable to 4M bytes of memory if they need it some time in the future, he said.

Guess who just unveiled seven

The new IBM 3161 ASCII Display Station is really seven different ASCII displays in one.

In addition to its own function-rich native mode, the new IBM 3161 can emulate:
- IBM 3101 Model 881
- ADDS Viewpoint*
- Hazeltine 1500*
- Lear Siegler ADM-3A*
- Lear Siegler ADM-5*
- TeleVideo 910*

Besides fitting nicely into existing systems, the IBM 3161 also offers impressive improvements in ergonomics.

Improved Ergonomics For Improved Productivity

Take the 102-key ASCII-style keyboard, for example. Its low profile, gentle contour and typewriter touch make for faster keying with fewer errors. The keyboard has programmable function and editing keys so it can be custom-tailored to meet your application needs.

Then, for comfortable viewing, there's the tilt and swivel of the 12" display. And the sharp, clear 8 x 16 character matrix for easy reading. Plus cursor, character and field attributes (blink, reverse video, underscore, dual intensity, etc.). And scrolling. And partitioning. And lots more.

The IBM 3163 with Plug-in Cartridge

And, as if that weren't enough, we're also announcing

The sharp 8 x 16 character matrix helps make for easier reading and fewer operator errors.

a second new ASCII display station with even higher function—the IBM 3163.

Outwardly, these two new displays look alike. But the 3163, in addition to its built-in emulation of the IBM 3101 Model 881, also offers the ability to emulate the DEC VT 52 and VT 100* by means of a unique plug-in cartridge.

And while you'll like the power and flexibility of the 3161, for your high-function applications the 3163 goes even further. For example, a 7,680-character buffer and up to three windows enable you to view and modify portions of different host data bases. The 3163 lets you redefine and even recap the keys.

On both displays the setup is menu-guided and written in plain English, so it can be done easily and quickly. The point is, both are designed to improve your user productivity.

Very Attractive Prices

The price per terminal is $695 for the 3161 and $1,095 for the 3163. Quantity discounts are available. What's more, IBM maintenance offerings start as low as $35 per year per terminal for customer carry-in repair.

Now there's a new family of ASCII displays with the quality, service and support IBM is famous for. Both displays are available through IBM Authorised Distributors and IBM marketing representatives.

FEATURES	3161	3163
Lines x Characters	25 x 80	25 x 80
Double-sized chars	No	Yes
Line drawing chars	36	36
Vertical scroll	Jump	Jump/Smooth
Definable function keys	36	36
Windowing	No	Yes
Partitioning	Horiz	Vert/Horiz

Call 1 800 IBM-2468, Ext. LE/90 for the name of an Authorised Distributor near you.

DBMS critical to firm's massive data analysis task

WINDSOR, Conn. — A firm here that helps nuclear utilities design and maintain portions of their reactors is using a relational data base management system to reduce engineers' work loads and expand report-writing capabilities.

The firm, Combustion Engineering, Inc., designs replacement cores for nuclear reactors, a task that calls on engineers to plug one piece of numerical data, or derivations of that data, into a number of different formulas. The firm also inspects its customers' steam generators for potential flaws, a job producing large data sets that require detailed engineering analyses.

Until last spring, when the firm brought up its DBMS, both of these processes suffered from inherent inefficiencies; among them were the following:

Replacement core design — data redundancy. A nuclear reactor exhausts a portion of its fuel supply every 12 to 24 months, and this must be carefully replenished. In this process, the added fuel and the fuel that remains inside the reactor must be arranged so that they produce even heat generation.

Combustion Engineering manufactures mechanical assemblies that hold about 200 of the long, thin rods in which nuclear fuel is stored. The firm also conducts sophisticated design work to determine how these fuel assemblies — a typical reactor holds 217 of them — should be positioned within the core.

Nuclear engineers at the firm study fuel depletion rates, energy production, reactor safety and other parameters to derive optimal configurations.

Before Combustion Engineering brought up the relational DBMS, engineers had to manipulate their design data to fit the various schemes, according to Steve Wagner, supervisor of physics design systems.

"The physics and engineering programs we use have been developed by different people and even different organizations, and they have used a variety of input formats," Wagner said. "Up to now, the design engineers have had to work with all of these; they've used a hand calculator or picked off the fundamental design data from a drawing and formatted it themselves for input into the programs."

One of the problems of the approach, he said, was that engineers had to manipulate the same piece of numerical data over and over for use in the different programs.

Generator inspection — inflexible reporting. As part of its maintenance services to clients, Combustion Engineering inspects tubes that carry steam through its customers' steam generators. The generators are one of a nuclear reactor's safeguards against radioactivity leaks, and the inspectors look for incipient flaws that might lead to a problem.

The Combustion Engineering inspectors send a probe that detects flaws into the thousands of tubes that each generator contains. With frequent inspections — some tubes must be inspected each time a reactor is refueled — the firm generates a large amount of data.

Data tracking crucial

The ability to keep track of this data is crucial, according to Wagner. "The key to our field-service business is our ability to manage the data we collect," he said.

Combustion Engineering had used standard Fortran programs to prepare client reports on a Control Data Corp. Cyber 180/855 with two million 60-bit words of memory. "These were inflexible" Wagner said, "and it was expensive to change the programs to suit each utility we serve."

Last spring, the firm brought Logica, Inc.'s Rapport relational DBMS up on the Cyber. Engineers and managers access data they need through Digital Equipment Corp. VT100 and CDC Viking 721 terminals and through IBM and Hewlett-Packard Co. microcomputers in terminal-emulation mode.

For design tasks, engineers use the DBMS to prepare and store data for the different fuel assembly arrangements they are considering. With a full screen input capability that Combustion Engineering designed, the engineers can call up a schematic diagram of the inside of a reactor and type in indicators of where they want to place assemblies.

The DBMS takes this and other design data and inputs it to the various engineering programs. The engineering programs, sequences of calculations, then simulate actual reactor operations and gauge the efficiency of proposed fuel assembly arrangements. The firm also uses its DBMS to organize and report on data that it gathers during probes of steam generator tubes. A Zetec Corp. DDA-4 signal processing system on a 1M-byte HP 9000 micro converts analog signals from the probes into digital information.

The investigators then pass the information on to the Cyber, and engineers working with the mainframe perform further analysis.

Managers can also call for ad hoc reports if they spot a new phenomenon and want to examine it. Wagner said they might, for example, ask for a report that lists each steam tube that has had a certain type of flaw.

different ASCII displays in one.

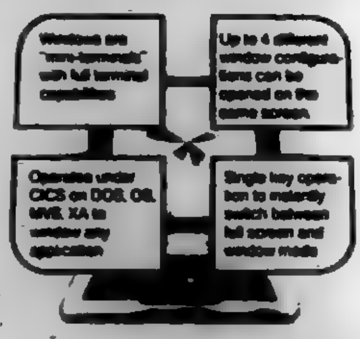
WINDOWS ON YOUR MAINFRAME TERMINAL
CICS – WINDOWS

SAVE YOUR HARDWARE $$$



Windows are "mini-terminals" with full terminal capabilities
Up to 4 different window configurations can be opened on the same screen
Operates under CICS on DOS, OS, MVS, XA to window any application
Single key operation to instantly switch between full screen and window mode

• Window facilities on every 327X terminal without any changes to your hardware or software

• Work with 2, 3, even 4 transactions simultaneously without losing valuable time switching back and forth between applications

• Increase productivity by having needed information instantly available on the same screen, including: other applications, menus, help screens, prior transactions, editors, notepads, etc.

Bank's package rates commercial loan prospects

CHICAGO — Joseph d'Ouville, senior vice-president at Exchange National Bank of Chicago, has been searching for a commercial loan package for more than 10 years.

"Most of the packages I looked at required too much paperwork, were too regimented or were too difficult to use," d'Ouville said.

Until a year ago, his search focused on mainframe packages. Then he came upon Customer Relationship Information System Program (Crisp) developed by Micro Resources, Inc. (MRI) of Novato, Calif. The package runs on an IBM Personal Computer XT with IBM's PC-DOS operating system and 320K bytes of random-access memory.

"Crisp was the only functional microcomputer package available when we were looking at microcomputer commercial loan packages," d'Ouville noted. The senior vice-president said that approximately 50 officers from the bank's eight divisions currently use Crisp. The software runs on a Novell, Inc. local-area network of six IBM Personal Computers.

Through a complete business cycle

Crisp is an integrated, multifunction reporting system that takes commercial loan officers through a complete business cycle: selecting customers and markets, setting goals, implementing plans, soliciting business, pricing loan packages, managing the business and measuring results. The package is designed to measure the profitability of commercial customers and to determine pricing for new lines of credit. It supplies three functions: planning, information retrieval and reporting.

A commercial customer's business is typically spread throughout a bank — deposits are made in branches, loans are certified at the main office and services are supplied by operations. With most software packages, determining a customer's profitability can be difficult, the senior vice-president said.

Crisp helps to integrate customer data bases into one package that enables officers to measure immediately the profitability of business alternatives, price loan packages and report the information to management and customers. Since Crisp places the information at the officers' fingertips, it enables them to make better decisions faster and communicate the results in tailored, easy-to-use report formats, according to d'Ouville.

"We were looking for a way to show each bank division how to break down profitability by its officers," d'Ouville said.

In addition, Crisp provides officers with a profit planning tool to develop goals for a portfolio of customers. The system includes a business solicitation module to help officers manage time, keep records straight and organize their calendars. A sophisticated loan pricing module allows officers to respond almost immediately to customer questions about costs while an account management module monitors customer performance once the loans have been booked. Finally, Crisp evaluates officers' performance against preset goals.

Exchange Bank uses the package in conjunction with data stored on its IBM 370 and 4341 mainframes. "Crisp automatically extracts data from various bank applications on a monthly cycle and stores customer information files on the local-area network's 40M-byte hard disk," d'Ouville noted.

"We can respond to loan requests in a much more meaningful fashion by analyzing the situation with the pricing module and evaluating the alternatives we have," d'Ouville pointed out.

We've Heard Rumors That The Guys At H-P Are Experimenting With A Way To Make Their LaserJet As Smart As Our SmartWriter.™

You can't blame them.

There's a chance their customers will think they've gotten the most intelligent, most versatile desk-top-size, non-impact printer on the market.

When, in fact, they may not have heard about ours. The remarkable QMS® SmartWriter.™

Whoops! This could lead to some very embarrassing questions, such as:

"Will your LaserJet Printer support QUME,® Diablo,® Epson,® and ANSI X3.64 escape sequences? The SmartWriter will.

"Does it have more than the two standard fonts I already know about? The SmartWriter has seven.

"Does it support a parallel interface? The SmartWriter does.

"Will it intermix fonts on a line or a page without expensive options?

"Will it reverse image or boldface fonts?

"Will your LaserJet Printer support overlays, draw lines and boxes, subscript and superscript?"

We can hear their answers now: "Uh, no." "Not really." "Not quite yet." "Sort of." "Almost. Can you wait just a few years?"

Well, you could do that.

In fact, you could wait a long, long time for the guys at H-P® to come up with something that's got as much brain power as a QMS SmartWriter.

Or you could go ahead and get a QMS SmartWriter. Right now.

Call us at (205) 633-4300. Or write us at P.O. Box 81250, Mobile, Alabama 36689. And we'll give you a lot more information. No rumors this time. Just facts.

PROVEN!

PC/FOCUS outloads, outruns, outperforms and outreports dBase III™ and R:Base™ 5000.

Don't believe us. Believe National Software Testing Laboratories of Philadelphia. They proved PC/FOCUS to be clearly superior to dBase III™ and R:Base™ 5000. Here's how:

Several real-world, business situations were created to examine each system's speed and capability.

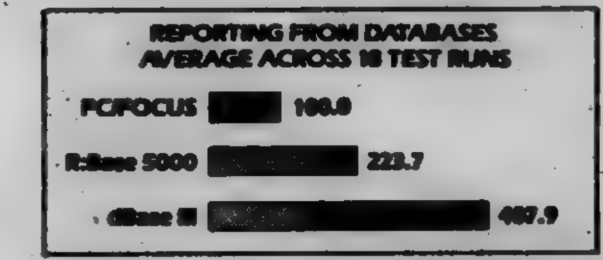
Their findings are published in an extensive report now available to you free of charge. Their results, as stated by NSTL, showed that..."PC/FOCUS was faster overall than the other programs tested." For example...

Database Loading:

In this test series, database loading time for each DBMS was measured by loading three transaction files. Eight separate test runs were conducted, with PC/FOCUS averaging 20.2% faster than dBase III™ and 37.3% faster than R:Base™ 5000.

Database Reporting:

Report requests of various levels of complexity were run against single and multiple databases. Eighteen separate test runs were conducted, with PC/FOCUS averaging 45.2% faster than dBase III™ and 40.0% faster than R:Base™ 5000.



There's more to the study than can be described in this ad. Lots more tests...and much more proof. So, we've reproduced the NSTL Performance Comparison in full. To obtain your free copy, just fill out the coupon and mail it to Donald Wszolek, Dept. C2 , Information Builders, Inc., 1250 Broadway, New York, NY 10001.

Automated bookkeeping system aids customer services

Firm's on-line system tailors client reports

NEW YORK — A 17-year-old direct-mail list management firm recently purchased a new computer system to automate its bookkeeping functions — only to discover that its new system was useful in helping to supply critical customer services as well.

Demographic Systems, Inc. (DSI), based here, manages and maintains mailing lists for clients in such retail fields as packaged goods, according to Mark Yearick, the firm's advertising and promotion manager. In addition, the firm provides client companies with computer services from duplication elimination to list enhancement and age coding, Yearick said.

DSI previously used a time-shared IBM 3081 mainframe for such jobs as processing name and address records. However, these large systems proved unsuitable for smaller functions, such as bookkeeping and related reports, according to DSI President Stanley Monsky.

Moreover, Monsky said, record keeping also had to accommodate both DSI's internal reporting needs and the requirements of its clients, who usually wanted reports to match their own accounting systems. Since a mailing list is among a company's most valued assets, list owners insist on being supplied with details regarding sales, payments and receivables information.

"We need to have all this information in an interactive data base so that we have access to it when necessary," Monsky said. Because his clients' needs are quite varied and often difficult to predict, flexibility in entering and retrieving data is essential, he said. "We also wanted a machine we could quickly integrate into our operation."

To meet its growing needs, DSI bought a Wang Laboratories, Inc. VS 80 with 512K bytes of main memory that was installed in January 1983, according to marketing manager Yearick. The system included a 90M-byte disk drive, 10 CRT display terminals, a DW0558 600 line/min printer and a B600-22 letter-quality printer, all from Wang.

Bookkeeping software consists of accounts payable, accounts receivable and general ledger systems written in Cobol and supplied by Mini-Computer Business Applications, Inc. of Montrose, Calif., reported Allen Williams, DSI's DP manager.

Although the VS was purchased for bookkeeping applications, DSI management soon realized other possible uses for the system, such as compiling count reports.

"Our business," Monsky commented, "is renting lists and defining markets. If a packaged goods [client] wants to mail 30 million samples to specific groups of people, he needs to break down the country into certain geographic and demographic segments."

Count reports help clients plan such campaigns, Monsky said.

To streamline production of the reports, DSI moved its integrated data bases, which contain all available information by county, Zip code and census tract, to the Wang VS. The data can also be merged with information on the national population and with DSI's in-house data bases to help a user focus on a specific target market, according to Monsky.

DP manager Williams developed a report generator in Cobol for the system. Now, when an account asks for specific information, Williams said, he can generate new reports on the VS in a matter of hours. Information can be retrieved and displayed in virtually any format.

In one instance, Monsky related, a DSI client required a report on newspaper circulation. DSI added circulation data to its existing data base and delivered the report the next morning, he continued.

Household data base

In addition to analyses along county or Zip code lines, DSI has also developed reports based on household-level data, Monsky said. "We believe the best possible geographic definer is the household," he noted.

DSI's data on some 65 million households is the starting point for reports that allow clients to use age as a fundamental selection factor, he said. The company's time-shared mainframe first compares a data base of about 167 million names with a client's file, he said. For every matching record, it then attaches information on family members, including exact birth dates, to the client's file. Counts from this expanded file are transferred to the VS, available for use as dictated by a client's specific needs, he said.

The age report derived from these counts shows how the client's list compares to DSI's file and to the national population in terms of age distribution, Monsky said. An index number for each age bracket tells the client in which bracket his list is likely to achieve the best response, he added. Reports are compiled on a national, state or county basis.

More than half of DSI's staff already has hands-on use of the VS, and new employees quickly take to the system, Yearick said.

The cost of transmitting data just keeps getting lower and lower. Thanks to Datagram. And our line of inexpensive, yet immensely talented modems.

All are totally soft and down-line loadable, have built-in signal quality monitoring, and run on unconditioned voice grade lines. Yes, that's right. Even our 14400 with built-in channel buffered mux which sells for under $4,500. And you can get it with trellis encoding for just a little more.

Our 9600 point to point modem is a real work horse at only $1,495. But if you want a 9600 with a four channel buffered mux, we've got that too at only $1,895.

If your application requires multi point modems, our 9600 fast poll train in 7½ ms. That's the fastest in the world. And goes for $2,195.

On top of that, all our modems are preconfigured at the factory, so all you have to do to get them going is connect them to the line.

We have modems or other data communications equipment in your hands in just 72 hours. The phone call is free. So call now, 1-800-235-5030 and order your Datagram modems today.

COMTEN CONNECTIVITY.

MORE THAN 1,000 NETWORK USERS KNOW IT'S THE WAY TO MAKE THE MOST OF WHAT YOU'VE GOT.

How can you get the most from your computer network? Link systems together that fit business objectives? Merge new and old technologies such as SNA and non-SNA? And create a network where all the pieces communicate cost-effectively?

More than 1,000 network users have answered those questions with Connectivity from NCR Comten. It allows them to make the most of what they've got. And it can work for you, too.

Connectivity is a Comten data communications processing system—3600 or 5600 communications processor with SNA, X.25 and pre-SNA software—that gives you the option to select network hardware and software that fit your business plan. Without your plan being constrained by a single vendor or architecture. And Comten Connectivity extends the life and value of your system by allowing it to coexist with newer technologies. The bottom line is *your* bottom line. Comten Connectivity allows you to mix and match hosts and terminals with full system compatibility and minimal network disruption—cost-effectively.

For over 17 years, NCR Comten has helped a growing number of network users attain their data communications goals. Discover how our Connectivity experts can help you make the most of what you've got. Write for our free brochure to: "Data Communications," NCR Comten, Inc., Dept. 8015, 2700 Snelling Ave. No., St. Paul, MN 55113. Or call 1-800-334-2227. In Canada call 1-800-543-5713.

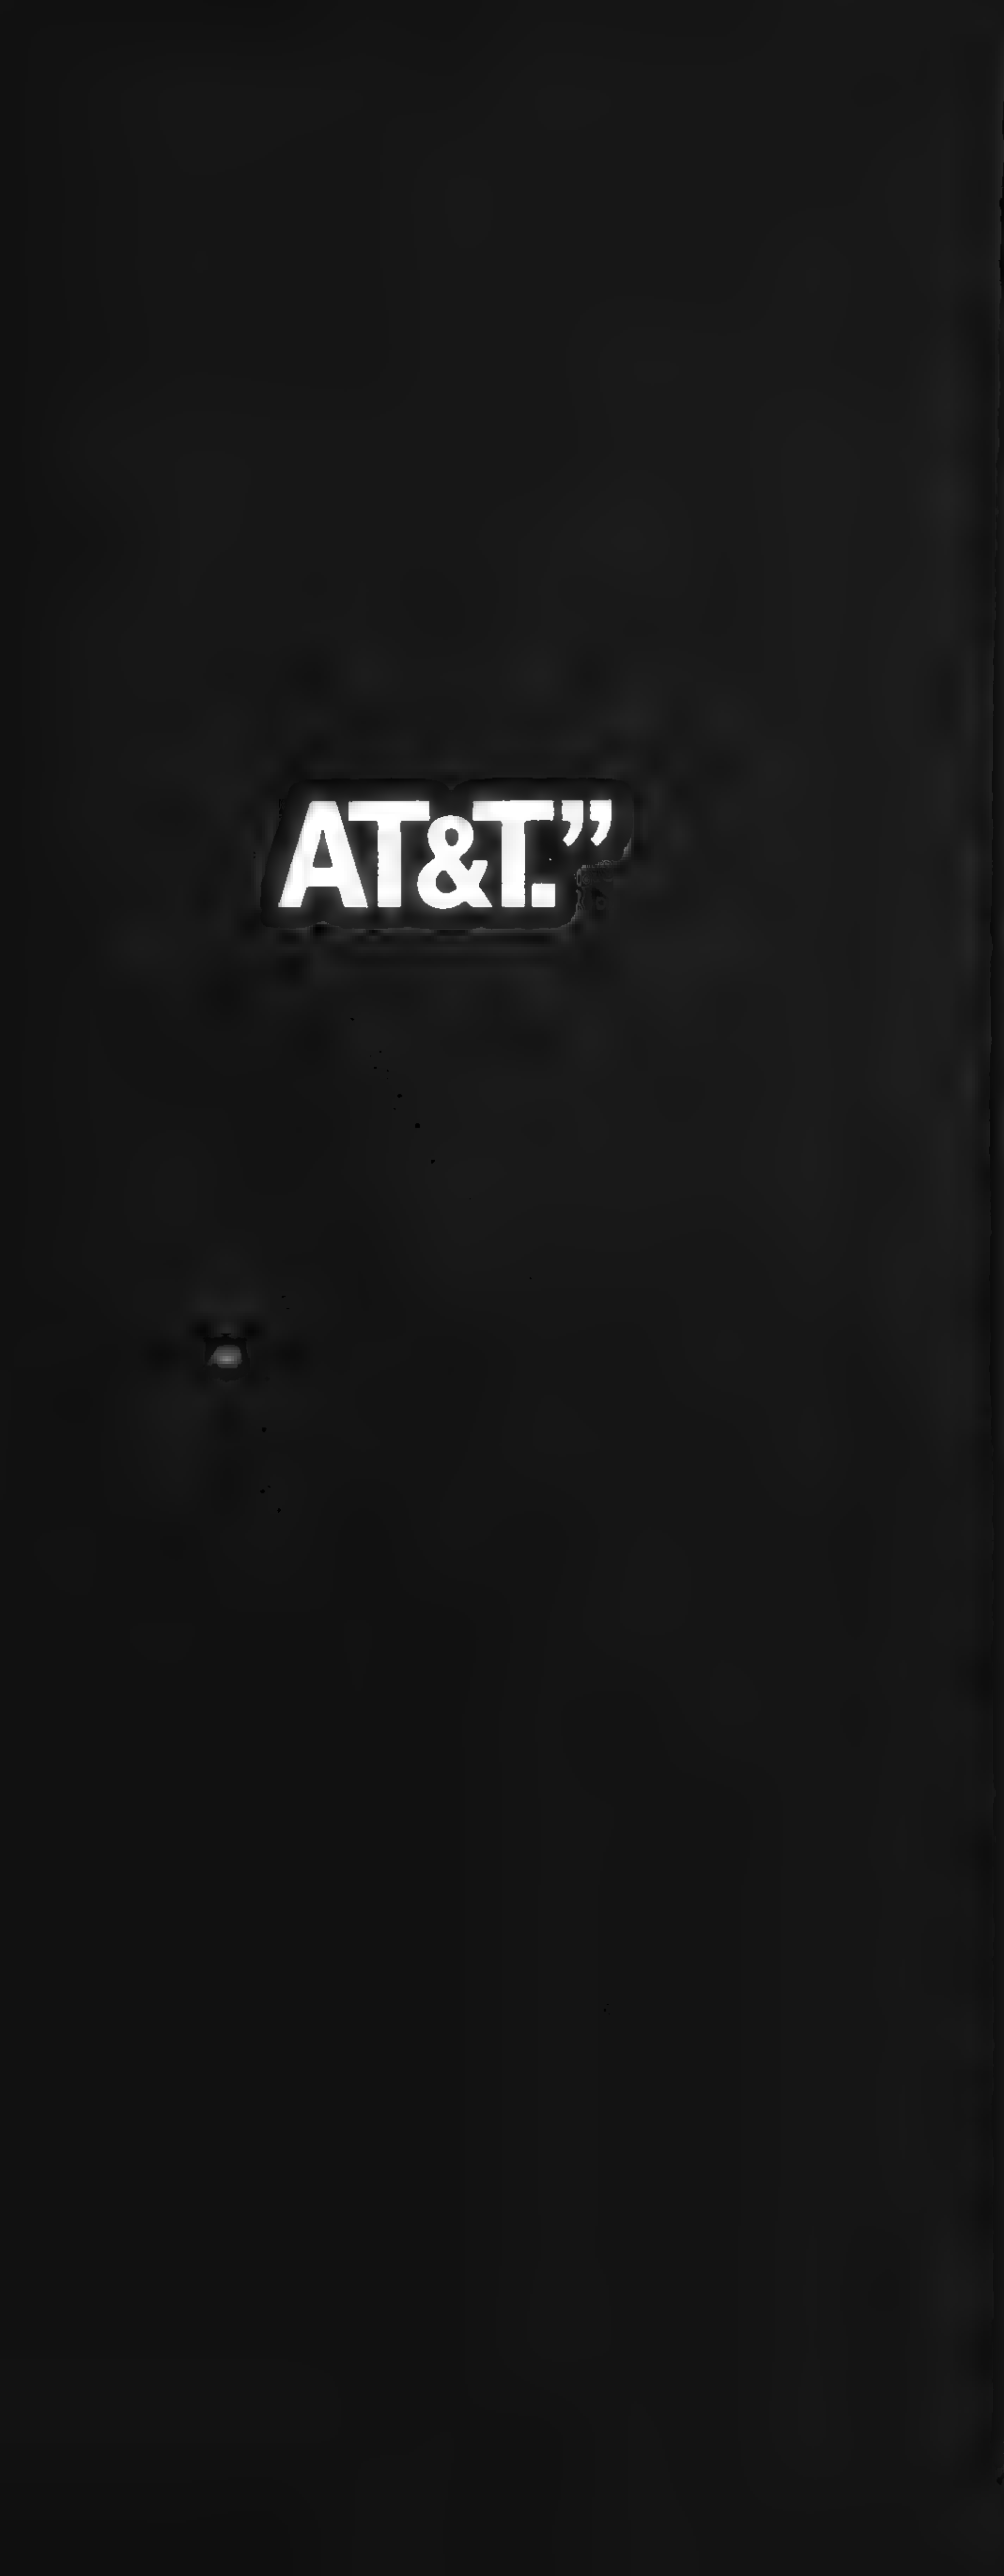
"Everybody I talk to offers
that fit their products,

solutions
instead of my needs."

"Better talk to



AT&T knows the
What you've already
as what you will buy.

Today, buying any computer product means thinking about where you've been—and where you're going.

AT&T understands this. Our computers are designed to protect your investment—with integrated products and solutions that help your system work *as* a system.

With AT&T Computers you can feel confident that your investment is and will remain a safe, sound business decision. It will pay off handsomely in increased productivity today and easy, efficient expansion tomorrow.

Three important questions:

Before making any investment in computers, invest a few minutes asking some tough questions. The answers from AT&T may surprise you.

1. Will the computer products I'm about to buy work with my existing system?

AT&T computer products conform to accepted industry standards. From minicomputers to modems, they're designed to fit in beautifully with your current IBM or compatible system.

In fact, AT&T Computers can talk to IBM* mainframes for easy access to host data using SNA/3270 or BSC/3270 protocols. Also available at a competitive price is the AT&T E4540 family of 3270-compatible controllers, keyboards and displays.

Our recently enhanced 3B Computers offer the performance advantage of UNIX™ System V in a departmental system, yet can be networked with existing MS-DOS**-based PCs.

Built on the principle of non-obsolescence, the DATAPHONE® II System is a full line of high-performance modems, multiplexers, data service units, and diagnostic control devices. These combine data transmission and sophisticated network management capabilities, thereby maximizing uptime of either simple or complex networks.

2. Will these products deliver the capabilities I need today? Am I getting my money's worth in terms of price and performance?

AT&T can answer "yes" to both questions.

reality of your computer needs. bought is just as important

Our line of high-performance computer products can be linked together to cost effectively deliver end-to-end communication and information management—from desktop to department, and from department to mainframe.

Our MS-DOS-based AT&T PC 6300 is twice as fast as the IBM PC, and has built-in color graphics capabilities and an easy-to-expand design.

Taking advantage of the UNIX System's multi-tasking, multi-user features, the AT&T UNIX PC offers a unique combination of power, ease of use and communications capabilities.

Our UNIX System V-based 3B Computers—five new or enhanced supermicro and minicomputers—provide distributed and departmental computing at a competitive cost per user.

We also offer full-featured, reliable peripherals—synchronous and asynchronous terminals, printers and plotters. Compatible with AT&T Computers and other vendors' systems, they deliver a full range of solutions to your peripheral requirements.

For ongoing investment protection, AT&T can provide comprehensive system services, including software development, system design, implementation, and training. A 24-hour technical hotline is available for hardware and software support.

THE COMPUTERS WITH THE FUTURE BUILT IN

AT&T [illegible], AT&T [illegible] and AT&T [illegible] Computers

3. What about tomorrow? Will these products keep my growth path open to accommodate future needs, especially in terms of networking capabilities?

No need to worry about the future when you start with The Computers With The Future Built In from AT&T.

As technology advances, AT&T will enhance and support its products, increase performance, and maintain compatibility with industry standards.

Our commitment to an open architecture and support of industry standards—MS-DOS, UNIX System V and SNA/3270 and BSC/3270 protocols—gives you the flexibility to satisfy your applications needs.

The power of the AT&T 3B Computer family can be networked in a variety of ways. Because they run UNIX System V, the 3B Computers offer an opportunity to build an open system with hardware independence and software portability.

What's more, our UNIX System V software base is growing by volumes.

AT&T's Information Systems Network links your equipment in a single corporate-wide network. The AT&T STARLAN NETWORK is our low-cost local-area network that uses existing phone wiring to tie your PCs together.

However your needs change, one thing won't change: Your investment is protected with AT&T Computers.

For a more detailed look at what AT&T computer products can do for you, just turn the page.

AT&T DATAPHONE II System

See what makes AT&T computer products a sound investment.

AT&T PC [illegible]

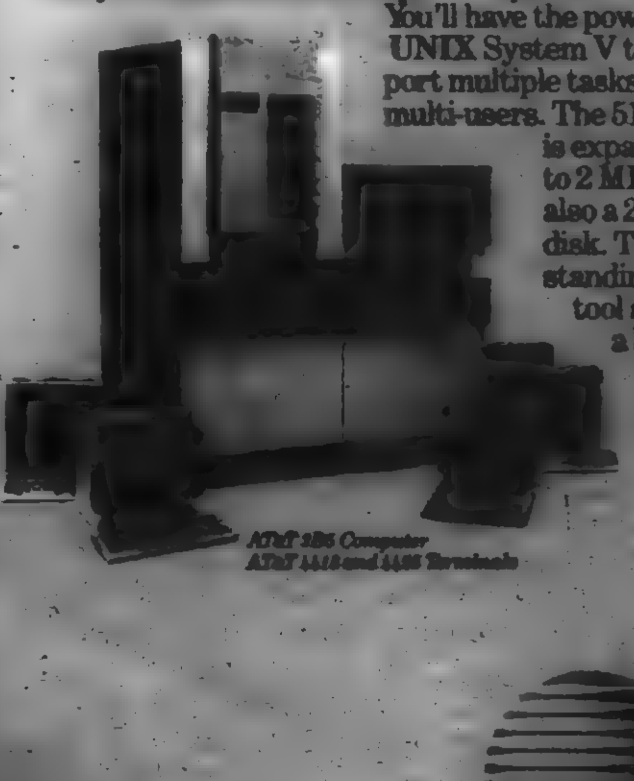
AT&T UNIX PC

Whether you start with a complete system or a single computer, these communications-based computer products are designed to protect your investments—past, present and future.

Our new AT&T 3B2/400 Computer takes full advantage of UNIX System V. This true 32-bit micro offers full hardware floating point performance, streaming tape backup and up to 4 MB main memory. Supporting up to 25 users, the 3B2/400 offers plenty of room for expansion.

For even higher storage capacity and performance, see what our 3B15 minicomputer can do. The 3B15 is equipped with a high-performance WE™ 32100 microprocessor with main memory up to 16 MB. It supports up to 60 users in a number of configurations. Other features include demand-paging memory management, file and record locking, and standard floating point performance.

For those looking for the next step forward in personal computers, the AT&T UNIX PC offers a unique combination of computer capabilities. You'll have the power of UNIX System V to support multiple tasks and multi-users. The 512 RAM is expandable to 2 MB. There's also a 20 MB hard disk. This outstanding business tool also features a built-in modem and communications features to easily access remote processors and departmental file servers.



AT&T 3B5 Computer
AT&T 4418 and 4425 Terminals

The DATAPHONE II System is a family of digital and analog modems, multiplexers, data service units, and diagnostic control devices for multilevel network management and control. We have added the DATAPHONE II 2500 and 3500 Series Digital Data Service Units to the family. An integrated DSU and channel service unit in one compact, easy-to-operate unit. It features a graphic LCD display for instant recognition of test results and is compatible with DATAPHONE II equipment.

The AT&T E4540 family offers true 3270 compatibility, and a choice of keyboards, controllers and screen colors. With Asynchronous Host Adapter option, you'll be able to switch back and forth easily between synchronous and asynchronous applications.

Our connectivity products conform to industry standards to insure that AT&T 3B departmental computers as well as desktop workstations can access your mainframe applications. For example, SNA/3270 Emulator + software provides fully configured SNA IBM 3274 controller emulation; BSC/3270 Emulator + software emulates the BSC IBM 3274 cluster controller.

AT&T E4540 Terminal
AT&T Dot Matrix Printer

AT&T Application Program Interface access routines allow C language programmers to communicate directly to host computers in 3270 mode.

There's much more to tell you about AT&T computer products, and how they can help solve your business problems.

So before you invest your computer dollars, invest a few minutes of your time with an AT&T Information Systems Account Executive, an authorized AT&T supplier, or call 1 800 247-1212.

The right choice.

Net fans air-conditioning supplier's delivery effort

FORT WORTH, Texas — A manufacturer here that once considered a three-day turnaround on deliveries an exemplary feat now consistently gets goods to customers two days after receiving an order — and often turns an order around in one day.

The time-saving was the result of a new on-line, satellite-based communications network, according to J. D. Ratliff, DP manager for Atco Rubber Co., a supplier of industrial air-conditioning duct products to some 4,000 customers.

According to Ratliff, delivery time is critical to the firm's success. "In our business," he said, "the prompt delivery of a customer's order is as important as price and product quality."

Before Atco Rubber brought in the satellite-based network, the firm had relied on dial-up Wats lines to transfer shipping and inventory data between terminals in its eight manufacturing plants and the corporate mainframe, a 196K-byte Honeywell, Inc. Level 62. An operator at Fort Worth corporate headquarters called each plant once a day to gather order and delivery information that would update the mainframe's central data bases.

The dial-up batch operation allowed only one plant to transmit data at any one time, and plant managers could only send data once each day. "Batch processing allows you to get your data from point A to point B," Ratliff said, "but it's very slow."

On-line communications capability

In the spring of 1983, Atco Rubber started looking for a system that would provide on-line communications capability. In January 1984 the firm acquired a 1M-byte Burroughs Corp. 1955 mainframe with Poll/Select protocol and linked the machine to terminals at the plants over RCA Cyclix Communications Network, Inc.'s satellite-based net.

Since then, Atco Rubber has opened four new plants. Each of its 12 locations now has an ET1100 terminal and an AP300 printer, both from Burroughs, with which to access the host computer.

Plant managers use the network to retrieve information about bills of lading, product inventory levels, production schedules and shipping transactions. Because all of Atco Rubber's data resides on the host, the satellite network plays a role in almost every phase of the company's operations.

When a customer calls in an order to the Fort Worth manufacturing facility, a clerk enters order data into an ET1100 terminal connected to the host. A proprietary software package automatically prices the order and creates a bill of lading, which is automatically transmitted over the network to the appropriate manufacturing plant.

At the plant, a manager receives the bill of lading on an AP300 and begins filling the order, either by using inventory or by initiating a manufacturing cycle to produce the necessary products. After each order is filled, the managers transmit a completed bill of lading back to the host, which produces an invoice for distribution to the customer.

Most customers receive their shipments and invoices within two days after they place their orders, and Ratliff said the turnaround helps cash flow. "The faster we can get the invoice into their hands," he explained, "the faster we'll be paid."

The on-line network also allows plant managers to update corporate data bases and make inquiries at all times, rather than once a day, and Ratliff said the capability has allowed Atco Rubber to improve its delivery and inventory trackings.

"With a dial-up Wats line, we were always behind in updating our shipments and inventory levels," he said. "With the on-line network, we can send shipments at any time during the day or night and have an instant record of what has been shipped and where," Ratliff added.

In turn, the improved tracking systems help the firm schedule its manufacturing capacity more efficiently, according to Ratliff. "The bottom line is that having fast and easy access to important operational data makes use more efficient and profitable," he said.

The satellite network itself is cost-efficient compared with the other option Atco Rubber considered for on-line communications. Ratliff said that when the firm was looking to install a network, it considered both AT&T and RCA Cyclix as vendors. Its managers figured that, in order to link the original eight plants, they would have to spend about $9,000/mo for AT&T line charges, compared with $4,000/mo for RCA Cyclix.

Included in the RCA Cyclix estimate were charges for network management services, a function Atco Rubber would have had to provide on its own under AT&T. "That's where the payoff was for me — not having to commit lots of money up front to start the network and then keep it running smoothly," Ratliff said.

Each of Atco Rubber's 12 plants currently transmits about two million char./mo over the network. Some plants have tied in Burroughs ET2000 personal computers, which employees use for word processing, spreadsheet analysis and terminal emulation.

MULTIMATE® TECHNICAL REPORT

Nine Ways To Get The Word Processing Advantage.

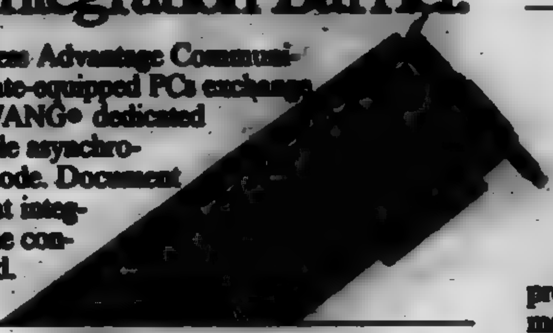
2.

Make Keying Practically Effortless.

The MultiMate Business Advantage Keyboard brings the features of a dedicated word processing keyboard to your PC. Color-coded keys labeled with MultiMate commands. 22 additional programmable function keys for key procedures or text recall. Separate cursor controls and numeric keypad. The keyboard layout preferred by touch typists.

3.

Cross The Integration Barrier.

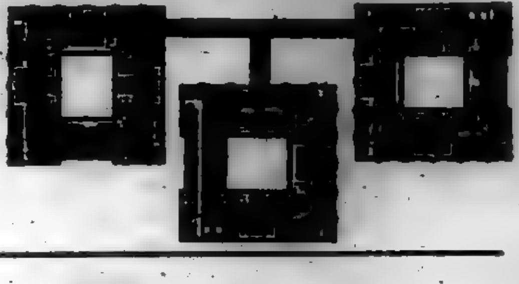


The MultiMate Business Advantage Communications Board lets MultiMate-equipped PCs exchange documents directly with WANG® dedicated word processors. Switchable asynchronous and bisynchronous mode. Document interchange with full format integrity and error checking. The conversion software is included.

4.

Take Advantage Of Local Area Networks.

LAN versions of MultiMate Advantage and MultiMate 3.3 Series bring word processing to every desk. Hardware specific versions enhance IBM PC Net, 3Com™ and Novell/Netware 86™ LANs. Universal LAN version also available.



SITE O.K. LICENSE

5.

Save With Site Licensing.

For large scale users, site licensing brings MultiMate convenience to every desk at substantially lower cost. You can even duplicate your own diskettes and documentation if you choose.

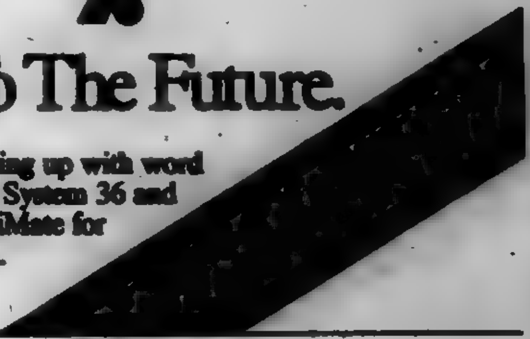
6.

Pick The Total Solution.

Multimate has products for nearly all word processing needs. Combine MultiMate Advantage with the Multimate keyboard and communications board, and you've got a word processing system that's hard to beat. Or choose MultiMate 3.3 Series for heavy duty word processing on 256K computers. MultiMate Executive for the corporate leader who wants word processing in a hurry with full MultiMate compatibility. MultiMate On-File, the versatile information manager that handles almost any filing need. And Just Write,™ the word processor for the occasional user.

7.

Look To The Future.



MultiMate is moving up with word processing for the IBM System 36 and mainframes. And MultiMate for minis—all coming soon.

8.

Look For Excellent Support.

MultiMate's technical support is the best in the industry with on-line assistance available every business day. User newsletters and training programs, too.

9.

Call 800-842-8676 ext. 902

You'll get the good word on MultiMate products and services. Or send some words of your own to: MultiMate International Corporation, 52 Oakland Ave., East Hartford, CT 06108. In Connecticut call (203) 522-2116, ext. 902

Automation helps manufacturer track production

Micros and bar codes offer added flexibility

CHICAGO — One of the most fundamental automated operations in any factory is the shop floor data collection system used to record workers' production activities, such as arrival at work or completion of a shop order operation. At ITT McDonnell & Miller, a manufacturer here, microcomputers and bar code wand readers perform this vital task.

McDonnell & Miller, a unit within ITT's Fluid Handling Division that produces boiler safety controls and other fluid-handling products, installed the micros and wand readers in January 1984. According to David Jung, senior member of the technical staff at ITT's Advanced Technology Center, McDonnell & Miller brought in the configuration to give its managers a flexible system for data collection.

> *Regardless of hardware, the feature that makes the system operable is the DCSI software.*

The technology center staff, based in Shelton, Conn., performs research and development for ITT's 290 divisions and corporations worldwide. Jung and his coworkers helped McDonnell & Miller design and implement its bar code data collection configuration.

McDonnell & Miller's previous system was a manual effort that had production workers fill out time cards and punch them through mechanical time clocks. The cards were collected at the end of each day and checked for errors. Afterward, clerks keypunched the time data and loaded it into McDonnell & Miller's mainframe, a 3M-byte IBM 4331, for payroll processing.

To replace the error-prone mechanical time clocks and make the data collection process more timely and efficient, Jung said, the organization investigated automated systems.

Microcomputers appealed to McDonnell & Miller's management because data collection systems based on micros were less costly and required less maintenance than mini-based systems, he said. Also, the organization's size made it a strong candidate for a micro-based setup.

McDonnell & Miller's 100,000-sq-ft Chicago production facility employs about 150 production workers and processes almost 300 orders each week. To support this work, the organization decided it would need 14 data entry stations — an ideal number for a single micro to support, Jung said.

After surveying products available, McDonnell & Miller chose Data Collection Systems, Inc. (DCSI) as its software vendor for the micro data collection system and purchased hardware that DCSI recommended. The organization's system configuration consisted of the following:

- Fourteen Intermec Corp. 1240 bar code wands, each attached to an Intermec 9320 electronic bar code reader. Employees pass the wands over bar code templates to enter data whenever they complete a job, and the readers decode the wands' analog signals.
- Two Intermec 9161 port concentrators that are hard wired to the wand readers and connected to a micro. Each concentrator has 64K bytes of random-access memory to buffer transactions when the micro is unavailable. One concentrator supports six wand readers; the other supports eight.
- Two IBM Personal Computer XTs, one for data collection through the port concentrators, the other for support processing. The processing microcomputer is fitted with an AST Research, Inc. 3780 bisynchronous card that allows it to upload and download data to and from McDonnell & Miller's 4331. Both the micro and the mainframe run RJE software that supports the data transfers.

When McDonnell & Miller first configured its system, DCSI recommended IBM equipment. The vendor has since approved ITT's Xtra micro as a suitable host, Jung said, and McDonnell & Miller plans to switch over to its parent company's product soon.

Regardless of hardware, the feature that makes the system operable is the DCSI software. Jung said the software maintains employee definitions, transaction contents and formats, inquiry requirements and support processing parameters. It also allows for the real-time collection of data from the wands throughout the workday and prohibits real-time entry when necessary.

At the end of each workday, for example, payroll personnel use utility routines in the software to check data that has been collected and correct any errors. When they have finished their corrections, they use another routine to close the data file and dump it to a floppy disk for transfer to the support processing

KODAK INTRODUCES THE COM

AUTOMATIC

START TO

It's the COM you asked for: A completely integrated system, automated and in-line.

Now your mainframe output can be printed by laser on film, processed, duplicated, and intelligently collated—yet nobody has to lift a finger.

No clock watching. No shuffling fiche into a duplicator. And no chemicals, because processing is by heat only.

You're looking at a real system, not parts stuck together. A design that started with a blank sheet of paper and then took shape over the years as we listened to what you needed—and translated those needs into fresh ideas that are years ahead.

For instance, there's a systems manager. A powerful new business computer that actually runs the operation, and also provides instant system access when requested. One benefit is that less experience and training are required for operators.

There's also an exclusive buffer for fiche masters, automatic exposure adjustments triggered by bar codes, and a programmable

© Eastman Kodak Company, 1985

micro. During both the inquiry and dumping operations, data from the time clocks cannot enter the machine.

The DCSI software also aided McDonnell & Miller in its transition from the manual system to the micro-based one, Jung said. The organization's employees used one of the software's utilities, for example, to customize the field and transaction definitions they needed for various shop floor transaction sequences.

During the transition McDonnell & Miller also wrote a program that would convert data that had been downloaded from the mainframe's IBM Copics data base into a format the bar code wand readers could understand.

Before the organization switched to its new system, staff members from the Advanced Technology Center helped it with preparatory tasks. They designed factory-hardened enclosures for the Intermec bar code equipment, for example, and created a training program for McDonnell & Miller's users.

The program, a slide presentation, includes an explanation of the system's purpose and the use of the bar code equipment and provides an outline of problems and how they should be solved. Jung said employees are instructed to contact their supervisors if any equipment problems arise.

To stimulate factory workers' interest, he said, McDonnell & Miller's management held a contest to name the data collection system. The name has not been chosen yet, but the contest succeeded in raising workers' enthusiasm. According to Stan Brusicki, assistant controller at McDonnell & Miller, the switch to the new system has been extremely successful. The hardware and software have been running as expected, and users have accepted the change.

•

ITT data collection: A step-by-step process

ITT's manufacturing unit, ITT McDonnell & Miller, uses its data collection system as follows:

Work orders are downloaded from an IBM Copics data base on the organization's host mainframe to the support processing micro for output to a bar code printer.

The printer takes the downloaded data and prints work order sheets, which include job numbers, part numbers and other information that identifies shop floor tasks. The work order sheets also have a numerical template, the bar code equivalent of a numerical keypad, that workers use to record the quantities they produce.

Each time a worker completes a work order, he uses a bar code wand to record data about the task.

A reader attached to the wand decodes the wand's analog signal so it can be passed to the data collection micro.

The worker follows a specific sequence:

- First, he makes a pass with the wand over his bar code employee badge.
- Next, he makes a series of passes over bar code blocks on the work order printout: He passes the wand over the task's job number, the part number of the product on which he has done work and the operation number of the task, all of which are represented by individual bar code blocks.
- After he identifies himself and his task, the worker makes passes with the wand over the numeric template to record the number of parts accepted and rejected.
- Last, he makes a pass with the wand over a bar code Send command that transfers the shop floor information to the data collection micro.

After each pass, the reader beeps once to let the worker know the information has been accepted by the reader. After the last pass, the reader emits a series of beeps to let the worker know whether or not the transaction has been completed properly.

If the transaction is complete, the reader beeps twice; if not, the reader beeps four times and the worker must repeat the entire transaction.

The reader passes data from all completed transactions to one of two port concentrators, which timestamps the transactions and passes information on to the data collection micro.

The data collection micro accepts transaction data throughout the working day. At the end of each day, payroll employees check the transaction data, then close the data collection file and dump information from it to a floppy disk.

They load this disk into the support processing micro, which uploads the data to the host computer for processing.

Qantel users get pamphlet

Datawell, located in Reseda, Calif., has begun publishing "Quser News," a monthly pamphlet for users of Qantel Corp. computer systems.

The pamphlet reportedly includes articles on the operation of Qantel systems and programming tips. "Quser News" will also include a question-and-answer section and a calendar section.

Subscribers to "Quser News" may advertise for free in the publication, according to Datawell.

The first issue, with a projected size of eight to 12 pages, was scheduled to be mailed in August, Datawell said.

A year's subscription to "Quser News" costs $48.

THAT DOES IT ALL:

Dairy condenses accounting time with ledger package

Off-the-shelf system keeps execs up to date

LIVONIA, Mich. — Accountants for a dairy products distributor here moved up their periodic financial closings by more than a week after the firm installed an off-the-shelf general ledger package.

Melody Farms Distributing Co., which delivers dairy products throughout Michigan, maintains a 13-period fiscal year and must close its books every four weeks. Until 1981, accountants armed with calculators managed to finish the work within two to three weeks after a period closed.

With the new general ledger software, from Executive Technology Data Systems, Inc., they finish the job within one week to ten days.

The quick closings allow Melody Farms executives to base their management decisions and marketing plans on more up-to-date information than they did previously, according to Philip Sattler, vice-president of information systems. Sattler said his firm originally planned to write its own general ledger software rather than purchase an off-the-shelf system, but changed its course after a frustrating 1980 experience with customized software development.

In that episode, Melody Farms had to pay a consulting company for more than four months of development work on three packages — order entry, route accounting and accounts receivable.

After the system was up and running on an IBM System/34 at Melody Farms, the consulting firm spent an additional eight months fixing bugs and making improvements on it, Sattler recalled. "If you can find software that can be modified to meet your needs, it is certainly the cheaper way to go."

But, Sattler added, "The problem was that a software package for Melody Farms had to meet several critical criteria." The firm decided that if it purchased a package, the software would have to have the following qualities:

- Be flexible enough to allow the controller and accounting department to structure general ledger account numbers in their own way.
- Allow the accounting department to work independent of the data processing department.
- Have source programs that were clean and consistent.

Melody Farms needed flexible software to enable its controller and his staff to number their accounts as they chose, rather than as a software system dictated, Sattler said. The firm runs several subsidiaries, including a production plant and a few financial companies, all with different types of accounts and financial statements.

Melody Farms' accountants had to be able to group the different accounts into cost centers as they saw fit. "With [the] parent company and subsidiaries requiring different financial statements, flexibility was a very important feature to us," he said.

Independence for the accountants was necessary, Sattler said, because he did not want them taking up MIS time with tasks that they could do on their own under a well-structured software system.

'At the vendor's mercy'

Consistent source code, with logic Melody Farms' programmers could understand, was a criterion, he said, because, "I don't want to be at the vendor's mercy." Sattler said he wanted to be able to modify the software on his own as the business' needs changed.

In 1981, Melody Farms purchased the general ledger package from Executive Technology Data Systems that met the three criteria, according to Sattler.

It proved to be flexible enough to run the parent company's and its subsidiaries' accounts and to accommodate acquisitions the firm has made since the software was purchased, he said. Last year, Melody Farms purchased a subzero warehouse and brought its accounts onto the general ledger system.

The software's source code, written in RPG-II, was easy to modify to meet Melody Farms' need for 13-period financial reporting, according to Sattler. He said that the package was set up for monthly reporting but that he changed it in one day to handle Melody Farms' reporting structure.

Sattler also added menus to the software so that the firm's accountants could set up reports they needed more easily. The accounting department now does almost all of its work without help from MIS.

"Our data processing department hasn't had to get involved in formatting financial statements or entering data," he said. "The accounting department sets up the statements and makes journal entries. All we do is make sure that everything is properly filed on disk storage and that we have backup copies on everything."

The package runs on a 256K-byte IBM System/34, one of two System/34s the firm operates. Melody Farms recently purchased an IBM System/36, but Sattler said he saw no need to transfer the general ledger to the new machine.

Guaranteed Compatibles.
Terminals So Good
We Could Have Built Them For DEC.†

But You Can Buy Them from Zentec For Less.

2400 Walsh Ave., Santa Clara, CA 95051, (408) 727-7662 (Outside California 1-800-332-3631)
†TM DIGITAL EQUIPMENT CORPORATION

ZENTEC
WE BUILD COMPATIBLES

Why the three letters you think of first for System/38 add-in memory shouldn't be IBM.™

EMC introduces its 1MB [illegible] expansion card for the System/38.

EMC has just added a feature to add-in memory for IBM's System/38 that's been sorely lacking.

Competition.

Like IBM's 1 Megabyte add-in memory, our new memory expansion card lets you boost the speed and performance of your System/38. Without increasing software or other hardware costs.

But unlike IBM, we let you do it for $2,000 less. (IBM's price is $7,500, ours is just $5,500.)

And our new 1 Megabyte memory uses newer, more reliable technology. It's *so* reliable, there *are no maintenance charges* of any kind.

IBM, on the other hand, charges you a memory maintenance fee of more than $1,000 a year. Every year.

Our memory comes with the industry's only unconditional warranty.

EMC is the first company to ever offer you an *unconditional lifetime warranty* on a System/38 memory card. And we offer the same warranty on every other memory card we make.

[illegible] special toll-free hotline and we'll send you a new card within *24 hours*—absolutely free.

And our new memory expansion card is *100% plug compatible* with the System/38. So it supports all IBM memory and memory diagnostic features. Installation takes just 10 to 15 minutes (you can even do it yourself) and does not affect your IBM maintenance coverage in any way.

We're the name DEC,™ HP, Prime™ and Wang™ users remember first.

EMC is the only independent supplier of memory expansion cards for the System/38.

As well as the world's largest manufacturer of add-in memory for minicomputers. Including Wang, DEC, HP and Prime.

Among our customers are AT&T, Merrill Lynch, Ford, Bank of America, General Mills, EXXON, 3M and many other Fortune 500 companies.

But you can't appreciate all that an EMC memory board can do for *your* System/38 by reading an ad.

You've got to use it.

To let you do that *before* you buy, we've come up with a special trial offer for qualified System/38 owners. Just call or write EMC Corporation at 12 Mercer Road, Natick, MA 01760—and we'll install a "no maintenance" [illegible] board for you without cost or obligation.

Then you can evaluate it for *two full weeks* on your own system, running your own applications.

Once you do, remembering our name will be a snap.

For your free two-week evaluation, call today:

1-800-222-EMC2

(In Massachusetts, call 617-655-6600)

MANAGERS ON THE MOVE

WALTER F. ROBINSON will head Mincron SBC Corp.'s Financial Services Industry consulting group. In this position he will oversee day-to-day technical operations and facilitate new business development.

Previously he managed Chemical Bank's World Banking systems group, provided strategic planning support to International Paper Co.'s corporate MIS organization and headed Procter & Gamble Co.'s internal consulting group for line marketing systems.

He has a B.S. in computer science and an MBA.

Mincron develops custom software systems and installs software packages for businesses using IBM System/34, 36 and 38 minicomputers.

■

HUGH K. SWITZER has been promoted to senior vice-president of MIS for Columbia Pictures Industries, Inc.

Switzer joined Columbia in January 1983 as vice-president of MIS.

Previously he was associated with American Express Co., where he was vice-president of information systems and data services for Warner Amex Cable Communications Co. from 1981-83 and vice-president of systems planning for corporate systems and telecommunications from 1977-81.

He graduated in 1960 with a B.S. degree from New York Maritime College.

■

The Internal Revenue Service announced the appointment of **BERNARD F. MILLER** as director of the new user assistance and computer capacity management office. In his position, Miller will be responsible for providing technical assistance to all functional areas on new automation technologies and helping users in developing automation plans that are consistent with the IRS' automation policies.

Miller began his career with the IRS in 1959 as a revenue officer in Hartford, Conn. In 1961 he transferred to the IRS national office in Washington, D.C. and has held a series of positions in data processing operations.

In 1981 he was named assistant director of the systems support division and in 1982 was appointed assistant director for the hardware division, a position he held until his present appointment.

He is a graduate of Bridgeport University in Bridgeport, Conn., with a bachelor's degree in accounting.

■

Jones, Carter Hawley Hale Stores

Carter Hawley Hale Stores, Inc.'s information services division has announced a number of organizational changes designed to strengthen the division's continuing support of Carter Hawley Hale's systems strategies.

WILLIAM F. JONES JR. has been promoted to executive vice-president of development and information management. Prior to his promotion, Jones was senior vice-president of development.

Carter Hawley Hale Stores' Spellman

WALTER H. SPELLMAN JR. has been promoted to senior vice-president of development and assumes responsibility for all Carter Hawley Hale's common systems development. Previously he served as divisional vice-president for store systems.

TROY T. NGUYEN was promoted to vice-president of merchandise systems. He was divisional vice-president of merchandise systems.

Carter Hawley Hale Stores' Menar

ROBERT M. MENAR has been promoted to executive vice-president of computing communications and planning. Menar had been senior vice-president of computing and communications.

NORMAN H. LEIBSON was promoted to vice-president of communications. He had served as divisional vice-president of communications.

Carter Hawley Hale operates 125 department stores and 154 specialty stores.

■

JULES SIEBURGH has been promoted to vice-president of information systems at Sonesta International Hotels Corp. Sieburgh will now manage all telecommunications activities in addition to his supervision of all DP for Sonesta.

He has been with Sonesta since 1978 when he installed a comprehensive property management computer system at the Sonesta Hotel in his native city, Amsterdam.

After successfully completing this project, he moved to Sonesta's corporate headquarters in Boston to assume the role of director of DP.

Prior to his promotion, he was responsible for the installation of property management systems at all Sonesta Hotels.

He has a B.S. in hotel administration and an MBA, both from Cornell University in Ithaca, N.Y.

Now you can link hundreds of PCs with a network that's big enough for a campus.

Most PC networks are designed to serve a department or a floor of a building – say, a few thousand square feet at most. If you need more capacity, tough luck.

LAN/PC™ from Interactive Systems/3M is different. It'll handle hundreds or even thousands of personal computers that operate under PC-DOS or MS-DOS, over an area with a diameter of up to 14 miles. It can link existing clusters (or even networks) of PCs without affecting their current cabling or operating characteristics. All needed language translations are made automatically, and the network will accommodate hundreds of software packages.

In short, LAN/PC is a convenient and cost-effective way to help your organization's users of IBM PCs, XTs, ATs, and compatibles share information and data storage.

LAN/PC is a trademark of 3M company; IBM and PC-DOS are trademarks of International Business Machines Corp.; MS-DOS is a trademark of Microsoft.

Find out more about LAN/PC from the pioneering company that offers the widest variety of broadband solutions to data communications problems.

Call 800-328-5727 ext. 178E toll-free. (In Minnesota, 800-742-5685 ext. 178E.)

TURNAROUND TIME

Larry Long

***Q** During the past six years, I have worked my way up to manager of corporate systems. Until recently, I reported to the same boss that hired me, an executive vice-president.*

I have been praised for growing with the increased responsibilities that my job required. I have never received a critical performance review or, for that matter, any constructive criticism.

I had only one computer course in college, so my computer education is mostly the result of on-the-job training. Two years ago, management discouraged me from taking graduate courses saying that I would learn no more than I could learn on the job.

Slightly more than a year ago, I hired someone with a master's degree in business administration and two years of experience as a programmer/analyst to be one of my managers.

Shortly after this person came on board, I received a memo from my boss stating that he would no longer report to me but to the president. I complained to my boss that after finally consolidating systems functions, we are fragmenting the department again.

Last month, my boss told me that a new position, called the director of MIS, had been created and would be filled by the person I had hired a year earlier.

I was also told that I would report to him and that most of the people that reported to me would now report to him and that he would report to the president.

On several occasions I have expressed my dissatisfaction with the organization to my new boss and have requested a revised job description that would demonstrate the company's desire for me to stay.

To date, I have received nothing but the assurances of the director of MIS that he wants me to stay. Could you suggest a strategy from this point?

It appears that you may be the victim of what I call the "gopher-to-vice-president phenomenon." This phenomenon occurs with surprising frequency in every variety of business endeavor.

Here's how it works. The president selects one of the top (usually, but not always, the top) young prospects to work directly with him on special projects. The gopher does a bang-up job (or the president believes this to be the case) and is made an assistant to the president. The next promotion is to something like assistant vice-president, followed shortly thereafter by a jump to, you guessed it — vice-president.

Your current boss was simply at the right place at the right time. There are definite advantages to rubbing shoulders with people in power positions. When a president or a vice-president needs someone in a hurry, the successful candidate is often within earshot.

To be sure, the change of power could have been handled more tactfully, but because of political exigencies, the situation may be irreversible. Reemphasize your concerns about your future with the company, then wait a reasonable period of time for a response.

In the interim, however, I would suggest that you update your resume, maintain good relationships with your colleagues and adopt a strategy that you are willing to leave if the right opportunity comes along.

***Q** After graduation, I took a job with a computer company and just had my six-month evaluation. Overall, my performance was rated as average, but all of the discussion centered on my attitude, dress and hairstyle, not on my job performance.*

During my sales training period, everyone gave me the impression that I was progressing at an accelerated rate, so my evaluation came as a surprise.

My evaluation was essentially a reflection of what my manager thought of my appearance. I wear a coat and tie and try to be neat. He told me that being neat was not good enough and that I should invest in some new clothes.

I would prefer to spend my money on other things. How can I convince him that clothes are not one of my priorities?

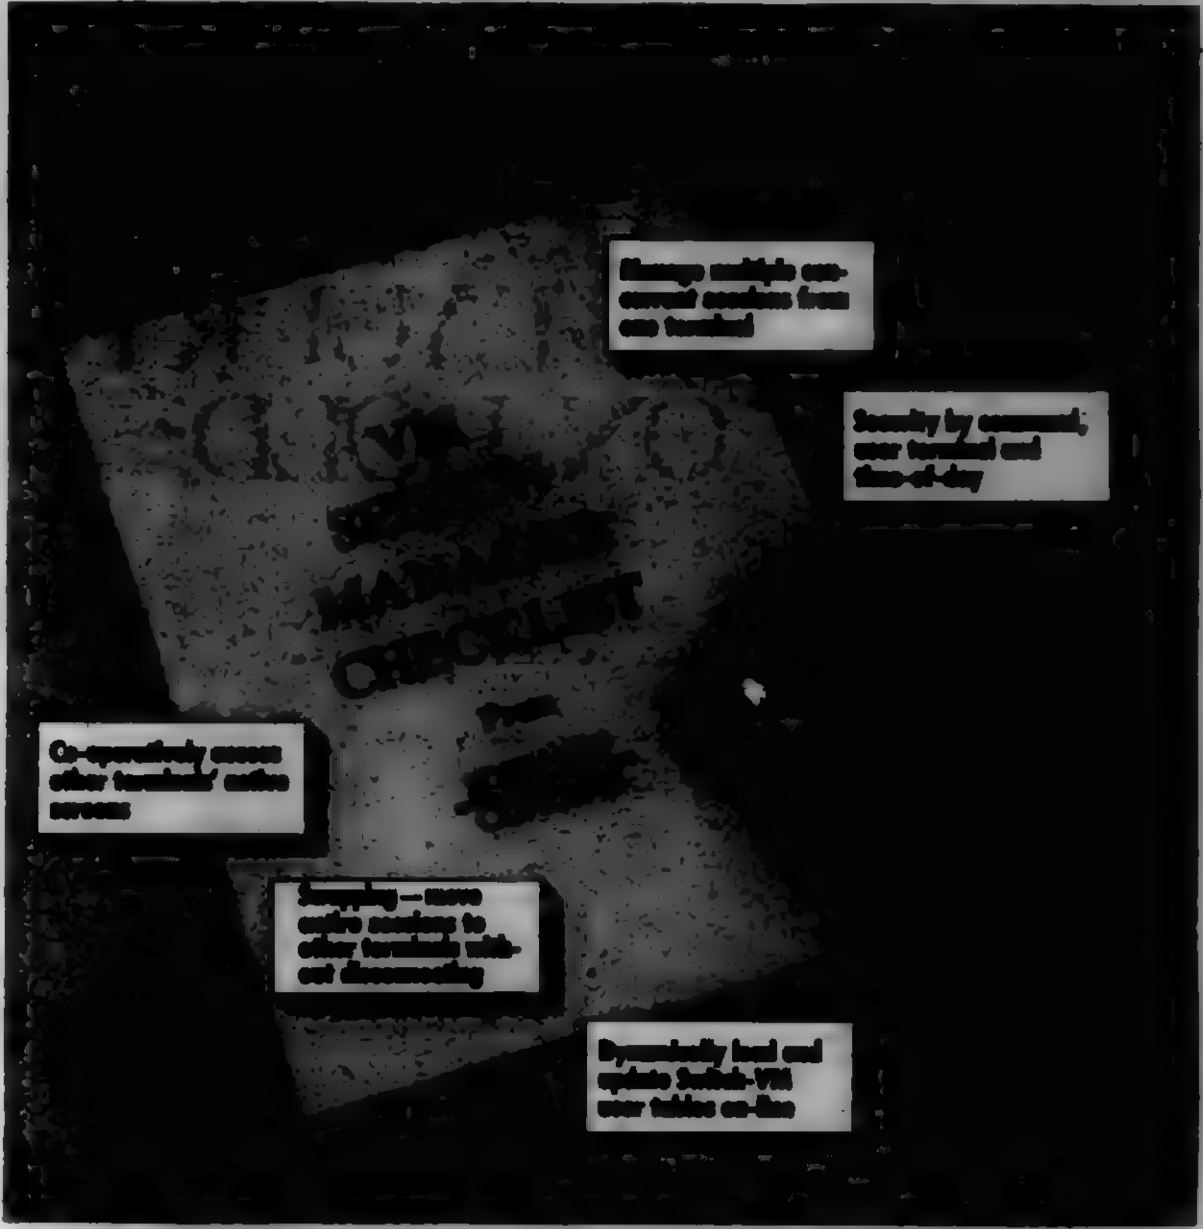
If being a successful computer salesman is one your priorities, then I would suggest that you rethink your priorities. Your manager was wrong to have downgraded your overall performance based solely on mode of dress, but he wanted to stress the importance of appearance.

Most jobs require some kind of personal concessions. Professionals that meet frequently with high-level customers and clients have found that adopting a traditional and conservative mode of dress generally yields the best results.

How you dress does not help you make a sale; it can, however, knock you out of the running.

The idea behind conservative dress is to help minimize the possibility of unnecessary objections so that the customer or client will focus on what you have to say or sell.

Long, president of Long and Associates, is a consultant, lecturer and author in the field of information services. If you have a question you'd like him to address, send it to Larry Long, Editorial Department, Computerworld, *P.O. Box 880, Framingham, Mass. 01701.*



MANAGER'S CHECKLIST
Manage multiple concurrent sessions from one terminal
Security by command, user terminal and time-of-day
Co-operatively access other terminals' active screens
Swapping — move entire sessions to other terminals without disconnecting
Dynamically load and update Switch-VM user tables on-line

The multi-session VM environment offers important advantages for both applications and development users. But switching between sessions on a single terminal causes wasteful delays—excessive dialing, time-consuming log-ons and log-offs, numerous keystrokes.

Now there's a software package that ends those delays. SWITCH-VM gives you single-keystroke switching, automatic sign-on and logging, screen copying, electronic messaging, debugging and assistance, all with complete security. The system contains 77 features in all.

To compare our capabilities with your needs—and our competitors' claims—send for the free checklist.

CALENDAR

WEEK OF OCTOBER 6

OCTOBER 6-8, SAN FRANCISCO — **Solid Modeling '85: Making CAD/CAM Pay Back.** Contact: Jacquelin Cooper, "CAD/CIM Alert," 824 Boylston St., Chestnut Hill, Mass. 02167.

OCTOBER 7-9, NEW YORK — **VM for Systems Programmers.** Contact: Sys-Ed, Computer Education Techniques, Inc., 35 W. 35th St., New York, N.Y. 10001.

OCTOBER 7-10, LOS ANGELES — **CICS Command-Level Programming.** Contact: Sys-Ed, Computer Education Techniques, Inc., 35 W. 35th St., New York, N.Y. 10001.

OCTOBER 7-11, BELLEVUE, WASH. — **C Programming Workshop.** Contact: David Cheyette, Specialized Systems Consultants, P.O. Box 7, Northgate Station, Seattle, Wash. 98125.

OCTOBER 7-11, KING OF PRUSSIA, PA. — **CICS/VS Command-Level Programming.** Contact: Ned Frey, Computer Assistance, Inc., Suite 490, 1150 First Ave., King of Prussia, Pa. 19406.

OCTOBER 7-11, LOS ANGELES — **Basic Systems Analysis.** Contact: Thomas J. Bisacquino, Association for Systems Management, 24587 Bagley Road, Cleveland, Ohio 44138. Also being held Oct. 7-11 in Calgary, Alta.

OCTOBER 7-11, LOS ANGELES — **Data Base Development Workshop.** Contact: Elise Rabalais, Learmonth & Burchett Management Systems, Inc., Suite 405, 2800 N. Loop West, Houston, Texas 77092.

OCTOBER 7-11, NEW YORK — **CICS Macro-Level Programming.** Contact: Sys-Ed, Computer Education Techniques, Inc., 35 W. 35th St., New York, N.Y. 10001.

OCTOBER 7-10, DENVER — **Using Microcomputers in Government.** Contact: Conference Manager, U.S. Professional Development Institute, 1620 Elton Road, Silver Spring, Md. 20903.

OCTOBER 8-9, MINNEAPOLIS — **Tenth Conference on Local Computer Networks.** Contact: Architecture Technology Corp., P.O. Box 24344, Minneapolis, Minn. 55424.

OCTOBER 8-10, TOPEKA, KAN. — **DSSD Users' Conference — Feedback '85.** Contact: Ken Orr & Associates, Inc., 1725 Gage Blvd., Topeka, Kan. 66604.

OCTOBER 8-12, NANJING — **Autoinfo China '85.** Contact: American Export Group International Services, Inc., Watergate 2600, 2600 Virginia Ave. N.W., Washington, D.C. 20037.

OCTOBER 9-10, CHICAGO — **The Financial Supermarket: New Fee Income Opportunities for Banks & Thrifts.** Contact: Alice Gibons, Inter-Financial Association, 21 Tamal Vista Blvd., Corte Madera, Calif. 94925.

OCTOBER 9-11, BOSTON — **Robots East.** Contact: Robotic Industries Association, P.O. Box 1366, Dearborn, Mich. 48121

OCTOBER 10, NEW YORK — **Vtam Operations Workshop.** Contact: Sys-Ed, Computer Education Techniques, Inc., 35 W. 35th St., New York, N.Y. 10001.

WEEK OF OCTOBER 13

OCTOBER 13-16, WASHINGTON, D.C. — **Information Science, Inc.'s 10th International Users Conference on Human Resource Management.** Contact: Information Science, Inc., 95 Chestnut Ridge Road, Montvale, N.J. 07645.

OCTOBER 14-16, SAN FRANCISCO — **Direct Response Marketing for Financial Institutions: Telemarketing, Direct Mail & Sales Training.** Contact: Alice Gibons, Inter-Financial Association, 21 Tamal Vista Blvd., Corte Madera, Calif. 94925. Also being held Oct. 21-22 in Los Angeles.

OCTOBER 14-16, PHILADELPHIA — **Managing Application Software Support Workshop.** Contact: Infosci, Inc., Box 7117, Menlo Park, Calif. 94026.

OCTOBER 14-17, NEW YORK — **Info '85 — Information Management Exposition & Conference.** Contact: Cahners Exposition Group, Client Services, P.O. Box 3833, 999 Summer St., Stamford, Conn. 06905.

OCTOBER 14-18, BOSTON — **Management Workshop.** Contact: Judy Trelogan, Arthur Young & Co. 1950 Roland Clarke Place, Reston, Va. 22091.

OCTOBER 14-18, NEW YORK — **Structured Systems Analysis Workshop.** Contact: Elise Rabalais, Learmonth & Burchett Management Systems, Inc., Suite 405, 2800 N. Loop West, Houston, Texas 77092.

OCTOBER 15, CHICAGO — **Transacting Business Electronically: Insights Into a Rapidly Changing Field.** Contact: Chi/Cor Information Management, Inc., 10 Riverside Plaza, Chicago, Ill. 60606.

OCTOBER 15-16, NEW YORK — **IMS Recovery Restart.** Contact: Sys-Ed, Computer Education Techniques, Inc., 35 W. 35th St., New York, N.Y. 10001.

OCTOBER 15-17, NEW YORK — **Implementing SNA.** Contact: Sys-Ed, Computer Education Techniques, Inc., 35 W. 35th St., New York, N.Y. 10001.

OCTOBER 15-17, WASHINGTON, D.C. — **Data Base: A Manager's Guide.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402.

OCTOBER 15-17, WASHINGTON, D.C. — **The Micro-Mainframe Connection.** Contact: Technology Transfer Institute, 741 10th St., Santa Monica, Calif. 90402.

HAS THE PHONE COMPANY PUT YOUR FUTURE ON HOLD?

The Centrex folks have you right where they want you: Plugged snugly into their decade-old technology.

That was fine when all your competitors had the same handicap. And when you had no choice.

Stop living in the past. Phone ROLM. Ask about the ROLM® CBX business communications system.

It'll put your future under your own roof. Not theirs. And help you control unstable phone costs. Now.

What's ROLM got going for you?

True integrated digital voice and data. (We started the whole thing.) ROLM brings 56 Kbps of data right to your desktop. So you don't poke along with Centrex analog technology. Or pay the freight whenever they get around to upgrading switches. Or hassle with their jury-rigged hardware to get the features you want.

Our superb CBX comes with all the bells and whistles you've secretly craved. From call forward-

4900 Old Ironsides Drive, M/S 626, Santa Clara, CA 95054

OCTOBER 15-18, HOUSTON — **CMC '85 and A/E Systems — Fall.** Contact: Conference Director, CMC '85 and A/E Systems — Fall, P.O. Box 11318, Newington, Conn. 06111.

OCTOBER 16-17, LOS ANGELES — **The Yates Second Annual Unix Market Forum.** Contact: Yates Ventures, Suite 301, 3350 Bayshore Road, Palo Alto, Calif. 94303.

OCTOBER 17-18, DENVER — **Federal ADP and Telecommunications Procurement.** Contact: International Data Corp., Washington Division, Suite 240, 1500 Planning Research Drive, McLean, Va. 22102. Also being held Oct. 31 to Nov. 1 in San Antonio and Nov. 14-15 in McLean, Va.

OCTOBER 17-18, NEW YORK — **VS Cobol II.** Contact: Sys-Ed, Computer Education Techniques, Inc., 35 W. 35th St., New York, N.Y. 10001.

OCTOBER 17-18, PHILADELPHIA — **Rapid Prototyping Workshop.** Contact: Infotec, Inc., Box 7117, Menlo Park, Calif. 94026.

OCTOBER 17-18, ATLANTIC CITY, N.J. — **The Third Annual NCR Users Eastern America Conference.** Contact: Jack Hibbard, A.D.R., Inc., P.O. Box 429, Willow Grove, Pa. 19090.

WEEK OF OCTOBER 20

OCTOBER 21-22, SAN FRANCISCO — **Lamond on IBM.** Contact: Reggi Veatch, National Marketing, Suite E-1A, Standard Court East, 9160 Red Branch Road, Columbia, Md. 21045. Also being held Oct. 29-31 in Dallas and Nov. 4-6 in Boston.

M&D micro-mainframe link eases insurer's reporting woes

By [illegible]

FAIRFIELD, Conn. — While microcomputer users in the financial and management reporting groups of the Orion Group were finding their micros valuable for analysis, the company's information center manager concluded that too much time was being spent keying data from the mainframe into spreadsheets.

"They spent too much time on things that analysts just don't do," according to Orion Information Center Manager Scott Stein. He decided the firm needed to implement a micro-mainframe link, but he had to sell the idea to the management of the national property and casualty insurance company.

Researching potential micro-mainframe products was Stein's first assignment. He began looking for micro-mainframe links that would allow Orion analysts to extract and transfer data subsets from the corporate financial data base to Lotus Development Corp.'s 1-2-3 running on IBM Personal Computer XTs. The company's choice was limited by its use of a data base and application systems developed in-house, Stein said.

The data base held more than 1 billion records, and users needed to pull down subsets of data — not entire files. According to Stein, of the three types of links available — terminal emulators, file transfer products and universal links — only the universal products were suitable.

Although fourth-generation languages could give users sophisticated query and transfer capabilities, "they lock you into [vendor] data bases," Stein said. "On top of that you spend $150,000 for the pack-

Users like PC Link, not price

BOSTON — Users of McCormack & Dodge Corp.'s Interactive PC Link micro-mainframe link package interviewed at the World '85 users conference held here recently raved about the product's capabilities, but they wished it cost less.

Smith, Albuquerque Federal Savings and Loan

M&D released PC Link in November 1983. The company modifies a Digital Consulting Associates, Inc. Irma board to support M&D applications and sells it with documentation for $2,200. The mainframe side of PC Link, for IBM IMS data bases in CICS environments, is priced at $25,000. For those customers who already have Irma boards installed on their IBM Personal Computers, the micro software and documentation is priced at $1,195.

PC Link was upgraded to Version 2 in January of this year, and Version 3 is in development, the company said. Some 1,500 PC Link packages have been shipped to 200 clients, according to Scott Conrad, who markets the product for M&D.

PC Link user Larry Erb, a project manager in the systems area for Forest Oil Corp. of Denver, said the product has worked very well in his company. However, he said, "they are priced higher than is realistic." Because micro-mainframe technology is changing rapidly and no standards are emerging, "it's almost like [the PC Link micro software] should be a throw-in," Erb said.

Since Forest Oil is a Software AG Adabas data base management sys-

Will IBM take AI by storm?

Artificial intelligence and the information center concept provide an interesting contrast in style — IBM's style, that is.

Both AI and information centers have been in the news recently in the wake of the International Joint Conference on Artificial Intelligence (IJCAI) and the Information Center Conference & Exposition. The gatherings, though small compared with wider market shows like the National Computer Conference or Comdex, served to highlight the intense interest in their respective topics of concentration.

AI and information centers are hot for one very simple reason. Each holds the promise of addressing problems that traditional technologies or approaches have failed to solve. For that reason, both conferences drew aware, interested attendees and fostered an atmosphere of intense, constructive discussion. There were many topics to be debated and a great deal of information and newly won experience to be shared. With good reason, professionals in each area — whose job titles are still taking shape — see themselves as pioneers.

But IBM's role in the fields of artificial intelligence and information centers is a study in opposites. When it comes to information centers, IBM has been a leader. In AI, IBM has been something else altogether.

Wearing the weathered hat of the pioneer, IBM — actually, IBM's Canadian counterpart — unveiled the concept of the information center. The information center was designed to meet two very pressing needs, needs that are no less critical today.

The information center was geared

ELECTRONIC MAIL COMMUNICATION CENTER

Lightyears Ahead . . .

The ONE electronic mail product that links all major operating environments: MVS, VSE, VM, CMS, CICS, TSO, ACF...

Emc² is easy to use. It's designed to get the mail moving *fast*.

Emc² functions as a super-efficient ACF/VTAM application. This allows literally thousands of people in your company to use mail without needing TSO, CICS, or CMS user IDs!

- Full-screen menus and help panels
- Scrollable inbaskets and outbaskets
- Uncomplicated text entry ● Mailing lists
- Bulletin boards ● Calendar features
- Timely Reminders "tickler file" (arrange for messages to be sent at some future date)
- Automatic new-mail notification
- Mail classes (partition Emc² into virtually separate mail systems)
- Efficient data base storage ● Simple installation
- Low administrative overhead
- Application programming interface

PLUS
- *Electronic mail networking* between mainframe sites
- *Integrated PC support* and integrated PC file transfer

Notes from the software industry front

The Hartford Insurance Group and **Wang Laboratories, Inc.** have agreed to develop and market integrated computer products and services aimed at enhancing DP productivity in large organizations. The Hartford has formed a subsidiary, Hartford Integrated Technologies, Inc. to develop the products.

■

Teknowledge, Inc. and **Digital Equipment Corp.** have announced an agreement that allows DEC to market, sell and distribute Teknowledge's S.1 knowledge development software for the VAX processor family. Teknowledge's recent announcement of S.1 Version 2 is said to integrate further knowledge-system technology into VAX and Microvax environments.

■

Apollo Computer, Inc. has announced five software supplier agreements for artificial intelligence-related products on its Domain workstations. Agreements were reached with the following: **Quintus Computer Systems, Inc.**, which markets Quintus Prolog; **Logicware, Inc.**, marketing Mprolog; **Production Systems Technologies, Inc.** marketing the OPS83 expert systems language; **Software Architecture and Engineering, Inc.**, marketing the Knowledge Engineering System expert system development tool; **and CCA Uniworks, Inc.**, marketing CCA Emacs, an intelligent real-time display editor.

■

Signal Technology, Inc. has announced that its Smartstar fourth-generation application development and data management system for VAX processors will be co-sold as part of DEC's Digital Classified Software program. Smartstar is said to be the only independently developed information management system that interfaces with DEC's Relational data base system.

■

Data General Corp. has announced that **Intersystems Corp.**'s "M," a systems software package combining the Ansi-standard Mumps programming language with utilities and data base software, will be available through DG's Independent Software Vendor program.

■

Intercontinental Hotels, Inc. has announced the development of a Group Sales data base system to be designed and implemented by **Multi Soft, Inc.**, the applications development and marketing subsidiary of **Multi Solutions, Inc.** of Lawrenceville, N.J.

Inference enhances ART development environment

Improves graphics, adds interfaces

Inference Corp., based in Los Angeles, has announced enhancements to its Automated Reasoning Tool (ART), a large-scale expert system development environment for end users and developers using artificial intelligence workstations from Symbolics, Inc., Lisp Machines, Inc. or Texas Instruments, Inc.

Added capabilities include improved color graphics, a graphics icon library, direct interactive and programmer interfaces to the knowledge data base, support for mixed initiative processing, a pseudo-natural-language syntax and separately compilable rule files.

The ART rule-based expert system framework is said to support integrated forward and backward chaining in order to optimize search strategies.

Knowledge language

The ART knowledge representation language allows developers to manage complexity through knowledge abstraction based on hierarchically structured facts, relationships and rules, according to a vendor spokesman.

The enhanced product's Viewpoints feature provides a way to evaluate multiple alternatives, rather than assigning artificial probabilities to decision points.

The Artist graphics environment is said to simplify the addition of images in an application by providing a set of drawing primitives controlled by rules in the knowledge base. The Artist features have been extended with color graphics and an icon library of predefined symbols.

Art Studio

The Art Studio development environment has been enhanced to provide added ways to view a knowledge base. An advanced browsing facility shows graphical views of hierarchical relationships.

A pseudo-natural-language syntax option reportedly simplifies the use of ART by allowing the developer to build a knowledge base readable in English-like syntax.

The mixed initiative processing allows an expert system developed in ART to prompt uses for information while reacting to user inquiries.

The ART system is priced at $85,000.

From page 61

Will IBM take AI by storm?

to help data processing reduce the massive applications backlog by giving users the resources and the expertise needed to build some systems on their own.

It was also intended to provide a focal point for management of the growing population of microcomputers within large companies. Information center personnel would tackle issues of personal computer hardware and software selection, installation and support and training of end users.

Thus they would allow DP pros to address more complex, technical problems.

IBM not only gave birth to the information center idea — it also has provided a variety of products that are mainstays in the information centers of today.

A prime example is the VM/CMS operating environment. Other important products include the Structured Query Language, the Professional Office Systems and DB2, IBM's relational data base management system entry which, despite initial criticism from analysts, has received good marks from users.

Horse of a different color

But AI is the proverbial horse of a different color — and, until recently, that color has not been blue.

According to AI aficionados, who, like descendants of the Pilgrims, take great pride in tracing their roots back to the beginning, artificial intelligence was a dirty word to IBM.

As they tell the story, Big Blue did not even acknowledge the field of AI until it became evident that customers were aware of AI developments and were willing to put out the cash — to vendors other than IBM — to experiment with AI and even implement some first-generation applications.

Even now that IBM has entered the commercial AI market, the criticism continues.

Sure, worried vendors say that IBM has validated or endorsed artificial intelligence with the introduction of systems like the Expert System Environment/VM and VM Programming in Logic [CW, Aug. 19].

But others in the field say that IBM's products are clearly less than state of the art and are designed only to keep users from straying to the same vendors clamoring about validation.

Dire predictions

Some in the AI field are making dire predictions about how IBM's entry will impact the pioneers, the vendors who were willing to take on the tasks deemed too insignificant by the big guys until now.

The restructuring of the AI market that is sure to happen may be painful, but it will certainly be interesting to observe. It's an unavoidable phase in AI's maturity, after all.

What's more, the negative assessment of IBM's performance in the AI field may be too harsh. It's true that IBM hasn't offered many commercial AI tools, but it has exhibited some fairly impressive AI research efforts. In all fairness, no one can expect IBM to be all things to all people.

But it is interesting to note IBM's approach to two of the most important areas of information processing today.

Only the future will tell whether IBM will take on the mantle of innovator in the field of AI or whether fears of a repeat of its shuddering impact on the personal computer market will be realized.

"Can he call you back? He's glaring at the word processor — it found 10 mistakes in his letter."

Teach your word processor to read.

Whether you have a CPT, Exxon, IBM, Lanier, NBI, Wang or Xerox, we can make it smarter. The compact Dest WorkLess Station™ lets you enter typewritten pages of different typestyles into your word processor automatically without using the keyboard.

INQUIRE®/Text:

Helps you find what's buried in your database.

You don't have to be an Einstein to realize that numbers are only part of the data your organization needs in order to be effective. As often as not, the information you need consists of a few key phrases buried inside a mountain of written documentation.

Until recently, accessing this information was a nightmarish task, largely dependent on paper filing systems and relatively fallible human memory.

But with INQUIRE/Text, it's easy. Powerful search commands zip through everything from research reports to correspondence—extracting vital information faster and more accurately than ever before.

The result is a quantum leap in the quality and diversity of online information available for decision support. For the first time, textual information can be retrieved and manipulated as easily as numeric data—with an output of up-to-date, integrated management reports.

No wonder INQUIRE/Text users include some of the world's leading scientists and researchers —not to mention lawyers, librarians, engineers, corporate records managers, and entrepreneurs.

And no wonder more and more people everywhere are seeing text management as an indispensable element of the Information Center.

INQUIRE/Text. The only system around that can turn a mass of text into a source of energy.

For more information call or write Infodata Systems Inc., 5205 Leesburg Pike, Falls Church, Virginia 22041, telephone (800) 336-4939. In Virginia call (703) 578-3430. Telex: 899125

Capacity planning modules out for Synova

Following up its June announcement of the Synova series, which is aimed at helping users integrate Uccel Corp. systems products with common logon, communications and command facilities, New York-based Uccel last week announced two capacity planning modules for the series.

The company announced Nova: Probe Resource Profiling Facility and Nova: Plan Capacity Modeling Facility.

The packages enable IBM mainframe users with MVS to model the impact of work-load changes on performance prior to allocating resources, a spokesman said.

The capacity planning model is based on data from standard data center monitors.

Model use

Capacity planners use the model to assess the effect of such measures as adding new batch or on-line work loads, expanding use of existing applications or increasing storage or CPU cycles.

Nova: Probe is priced at $12,500, and Nova: Plan is priced at $20,000. Together, the packages are priced at $26,000. Both are available immediately.

The Synova series was announced at Uccel's Systems Software Conference in Dallas.

Most Uccel software is integrated at the product level, with each package having limited predefined interfaces.

Layered architecture

The Synova series reportedly allows for full integration using a layered architecture, through which all commands and requests for data are controlled.

Other products in the series are Nova:Log, scheduled for September availability, and Nova:Save, which provides for the automatic backup of data stored on an IBM Personal Computer hard disk.

The products are said to be the result of a two-year research and development effort.

Enhanced Ramis II announced

Martin Marietta Data Systems of Princeton, N.J., has announced an enhanced Ramis II English release that reportedly improves the product's fluency and ease-of-use characteristics.

The company's Ramis II English natural language comprehension component adds artificial intelligence capabilities to the Ramis II fourth-generation language and data base management system, a spokesman said.

Release 2 of Ramis II English includes added ability to display information in graphics form using conversational English. Information can be displayed in either low-resolution graphics or high-resolution graphics on terminals from IBM, Tektronix, Inc. and Hewlett-Packard Co.

Graphics available for display include pie charts, histograms, bar charts, line graphs and point graphics.

Date and time references

The enhanced release is also said to improve date and time references. Information can be displayed and printed using conversational requests that include references to relative time and a variety of date patterns.

Users do not need to match dates in their request with the way dates are formatted in a data base.

The product's vocabulary has been extended with an additional 1,000 root words, bringing the total vocabulary to more than 5,000 root words.

The price for Release 2 of Ramis II English ranges from $13,500 to $27,000, depending on CPU.

Martin Marietta also announced that its Maxicalc II on-line electronic spreadsheet for IBM mainframes in the CICS environment now supports IBM's newly announced 3179 Model G color graphics terminal.

Maxicalc II is priced at $9,000 for DOS and $12,000 for OS operating systems.

Henco Software tool gets DG port

Henco Software, Inc., which is based in Waltham, Mass., has announced that its Info data management system and applications development tool has been ported to the Data General Corp. Eclipse/MV, Dasher/One and Data General/One series processors.

Info operates in conjunction with DG's Comprehensive Electronic Office system.

Henco was selected as the first member of DG's Authorized Software Vendor progam in February.

Info on the DG systems ranges in price from $14,300 to $30,000 for the Eclipse/MV family. The system costs $1,200 for the DG/One and Dasher/One systems.

AT™ Pfantasies for your PC or XT.™

Want better speed and memory on your PC or XT without buying an AT?

You've got it!

Phoenix's new Pfaster™286 co-processor board turns your PC or XT into a high-speed engine 60 percent faster than an AT. Three times faster than an XT. It even supports PCs with third-party hard disks. But that's only the beginning.

You can handle spreadsheets and programs you never thought possible. Set up RAM disks in both 8088 and 80286 memory for linkage editor overlays or super-high-speed disk caching. All with Pfaster286's 1mb of standard RAM, expandable to 2mb, and dual-mode design.

You can develop 8086/186/286 software on your XT faster. Execute 95 percent of the application packages that run on the AT, excluding those that require fancy I/O capabilities your PC or XT hardware just isn't designed to handle. Queue multi-copy, multi-format print jobs for spooling. Or, switch to native 8088 mode to handle hardware-dependent programs and back again without rebooting. All with Pfaster286's compatible ROM software. And, Pfaster286 does the job unintrusively! No motherboard to exchange. No wires to solder. No chips to pull. Just plug it into a standard card slot, and type the magic word, "PFAST."

If you really didn't want an AT in the first place, just what it could do for you, call or write: Phoenix Computer Products Corp., 320 Norwood Park South, Norwood, MA 02062; (800) 344-7200. In Massachusetts, 617-762-5030.

For the Ferrari aficionado: yes, we know this is a rear engine car. We are showing the addition of a second engine to symbolize how Pfaster can be added to your PC or XT to increase performance.

The customer said:
"I need one
computer system
powerful enough to
deliver business,
scientific/engineering, and
end-user processing
with great performance."

And we said…

"It's here."

The DPS 90 is Honeywell's most powerful information processing system.

It was developed specifically to help even the largest organizations meet all their information processing and management needs.

THREE WAYS TO HELP

As a commercial system, the DPS 90 is capable of integrating a broad spectrum of business data processing and data management tasks—with high volume transaction and batch processing capabilities to help keep management information up-to-the-minute.

As a scientific and engineering number cruncher with an integrated array processor, the DPS 90 has all the computational power to meet the performance demands of large, sophisticated applications.

And, as an end-user system, the DPS 90 delivers all the data necessary to knowledge workers throughout a company—from the executive offices to the factory floor to the accounting department. With user-friendly software, the DPS 90 now brings mainframe computing power directly to computer novices to improve productivity in all parts of the company.

MAXIMUM UPTIME

Because Honeywell understands that maximum uptime is essential to our customers, the DPS 90 has extensive diagnostic capabilities built right into its hardware, firmware, and GCOS 8 software. In fact, it can be configured as a completely redundant system—making it one of the first mainframes ever to offer so much performance and availability.

And like all our large systems, the DPS 90 is backed by TotalCare™—Honeywell's worldwide service network that is ready to provide a full range of service and support.

Find out how the new DPS 90 can set the stage for expanding your total information management capabilities *and* help maximize your company's return on its information investment. Call 1-800-328-5111 extension 2758. Or write Honeywell Inquiry Center, MS 440, 200 Smith Street, Waltham, MA 02154.

Honeywell 100 Years

Together, we can find the answers.

Windows. Our easy-to-use windowing interface allows you to display a concurrent 3270 host and PC DOS session in addition to one or two user notepads. Windows can be used for copying screen display contents from either the host or DOS session to one of the notepads. And, up to ten different display profiles can be defined and stored to meet most application requirements or user preferences. You save time and enhance productivity.

The windowing interface is standard with AST-3270/COAX.

Start Your Own Family. Relax, beginning a 3270 communications family of your own is easy with the help of an experienced neighbor, like AST. With our 3270 products you'll be communicating with your corporate mainframe in no time at all.

Select the package that suits your current needs. AST-3270/COAX gives you full-featured 3278/3279 terminal emulation, and AST-PCOX is the economical choice that lets you add file transfer or easily upgrade to AST 3270/COAX.

There's remote cousins, also. Standalone, clustered and LAN gateway PC communications, in either BSC or SNA/SDLC protocol environments, are a snap with these easy to use products.

First In Quality. AST's worldwide reputation is built on quality products, quality support and quality service. Our complete documentation means every 3270 product is exceptionally easy to install and use, and if there's a problem, we're always here to help.

So, get to know the family—AST's 3270 Family. Call our Customer Service Information Center (714)863-1333 for more information.

APPLICATION PACKAGES

■ Applied Computer Services, Inc. has announced that its software for the credit union industry now runs on the IBM System/36.

Previously available on the IBM System/34, Credit Union Solution software is an accounting system that provides functions for stock shares, drafts, certificates of deposit, loans and Individual Retirement Accounts. The software permits process accounting for branch operations and can be used to account for automated teller machine networks.

The Credit Union Solution is priced from $12,000 to $40,000.

Applied Computer Services, Suite 909, 2343 E. Broadway, Tucson, Ariz.

DATA BASE MANAGEMENT SYSTEMS

■ SAS Institute, Inc. has introduced an interface for its SAS System software and its System 2000 data base management system (DBMS).

The interface incorporates a prewritten procedure that selectively converts data base items and records into a permanent or temporary SAS data set. The interface, which is included in base SAS software under IBM's OS and CMS, allows users to select data from the data base using a full screen menu within an SAS session. The data can then be used for graphics, reporting and analysis.

First-year license for SAS software is $8,000. System 2000 DBMS is priced at $12,000.

SAS Institute, Box 8000, SAS Circle, Cary, N.C., 27511.

Informatics offers IDMS storage tool

Informatics General Corp. of Canoga Park, Calif., has announced mainframe software that is reported to compress and encrypt the data stored in Cullinet Software, Inc.'s IDMS data base management system by up to 80%.

Shrink/IDMS is intended to reduce the amount of disk space required to stored IDMS data bases, a spokesman said.

The product is an addition to the company's line of file compression products that includes Shrink/IMS for compression of IBM IMS data bases.

Shrink/IDMS has an error redundancy checking feature. The package is available under IBM's MVS and MVS/XA operating systems and will execute in batch and on-line modes under IBM's CICS/VS, TSO and IDMS/DC.

The product requires no changes to existing IDMS application programs, according to an Informatics spokesman.

The price for Shrink/IDMS is $65,000.

LANGUAGES

■ Touch Technologies, Inc. has announced an enhanced version of its fourth-generation language for Digital Equipment Corp.'s VAX series.

The new version of the Intouch language is said to include screen management facilities and extensions for applications development. The product is also said to extract and manipulate data, regardless of the way the data is stored.

The cost of enhanced Intouch is $7,500 for the VAX-11/730 and Microvax II, $15,000 for the VAX-11/750, $25,000 for the VAX-11/780 and 11/785, and $40,000 for the VAX 8600.

Touch Technologies, Suite 101, 609 S. Escondido Blvd., Escondido, Calif. 92025.

■ Sun Microsystems, Inc. has announced a version of Lucid, Inc.'s Portable Common Lisp AI programming language for the Sun family of workstations.

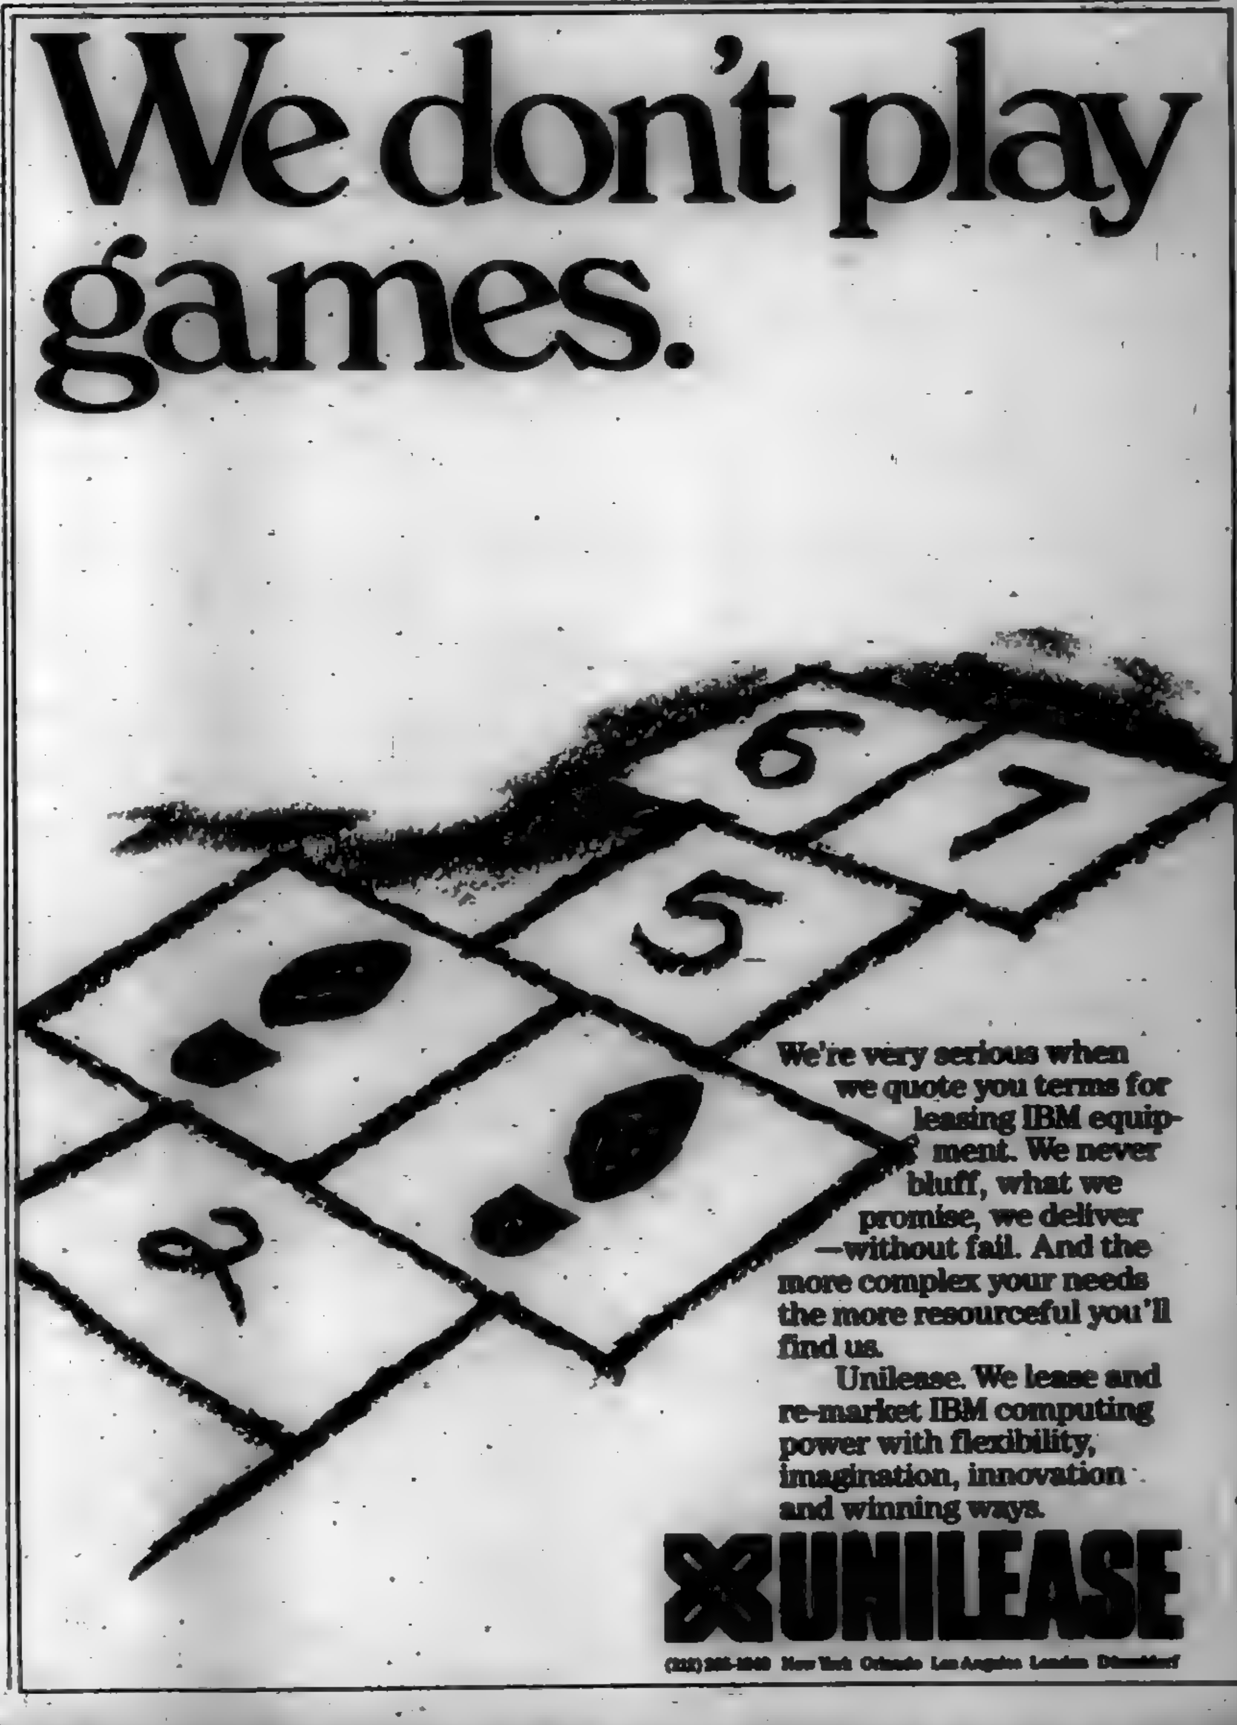
Sun Common Lisp is enhanced with tools to optimize its performance on Sun workstations and to integrate Lisp capabilities into Sun's AT&T Unix programming environment, a spokesman said.

The Sun Workstation computer systems with Sun Common Lisp range in price from $8,900 to $50,000. Sun Common Lisp is said to be a full implementation of Common Lisp. All programs written in Sun Common Lisp can use the interactive windowing and graphics capabilities of Sun workstations. Mechanisms are included for interfacing Sun Common Lisp to C, Pascal and Fortran programs.

Sun Common Lisp can be licensed as a development environment or as a runtime applications environment. The development environment features a library of functions, special forms and macros to speed programming. It also offers an optimizing compiler and an interpreter. A set of tracing and debugging facilities is said to enhance productivity. The development environment reportedly enables construction of hybrid applications that use symbolic and numeric computation.

Sun Common Lisp costs $3,500 for license, tape and documentation. The applications environment will be available separately for $875. The product is scheduled for fourth-quarter availability.

Sun Microsystems is located at 2550 Garcia Ave., Mountain View, Calif. 94043.



We don't play games.

We're very serious when we quote you terms for leasing IBM equipment. We never bluff, what we promise, we deliver—without fail. And the more complex your needs the more resourceful you'll find us.

Unilease. We lease and re-market IBM computing power with flexibility, imagination, innovation and winning ways.

UNILEASE

[illegible] New York Orlando Los Angeles London Düsseldorf

TRAINING

■ GMD Systems International, Inc. has announced an end-user training program for users of IBM's Mapics I or Mapics II business control system.

The program, dubbed Mapics Unsupervised System Education Resource (User), is a series of multimedia instructional packages intended to improve user skills necessary for using the display stations for data entry. The program trains users to obtain various reports and inquiries produced by the Mapics system.

The first User modules covering product data management, inventory management, costing and production control and costing are available now. Each Mapics User module is priced at $1,295.

GMD Systems International, Suite 420, 8601 Dunwoody Place, Atlanta, Ga. 30338.

■ Control Data Corp. has announced the Ada Programming Series, a 90-hour Plato computer-based training curriculum for training programmers in the higher order Ada language. The Ada Programming Series runs on CDC's Plato Personal Training Station and on other IBM Personal Computer-compatible systems.

The series includes three courses: Ada Programming: Fundamentals, Ada Programming: Advanced Features and Ada Programming: Soft-

From page 61

Users like PC Link, not price

tem (DBMS) shop, the firm evaluated Software AG's Natural Connection micro-mainframe link late last year, Erb said. He added the feeling was the Software AG link was not ready, so his firm went to M&D's PC Link.

Forest Oil now has five PC Link packages installed for budgeting applications. The micros link IBM Personal Computers to an IBM 4341 Group 2 mainframe running MVS. Instead of downloading production data into spreadsheets, the company downloads data to an Ashton-Tate Dbase III DBMS on the Personal Computer, Erb said. Users in several division centers with Personal Computers with PC Link prepare budgets and send them to corporate headquarters, where they are merged into a single budget, Erb said.

M&D's Conrad indicated that PC Link's price may be cut. "If anything, it will go down. I don't see the price on the micro side going up," he said. He said price was not an issue on the mainframe side.

User Bruce Pergament, vice-president of administration for Pergament Home Centers, a retail chain of 40 stores based in Melville, N.Y., said the PC Link price may be justified by the product's development costs. "It's not easy to say the product is too expensive," he said.

Pergament said his firm, which is privately held with revenue of more than $100 million annually, decided to buy PC Link when it bought M&D's general ledger accounting package nine months ago.

"We felt it was a necessary adjunct to the [general ledger]. We felt any [general ledger] we bought today needed a link. We feel we can do all our budgeting with two or three people," on IBM Personal Computers with PC Link connected to the company's IBM 4381 mainframe, he said.

Downloading to 1-2-3 attractive

PC Link's ability to download data to a Lotus Development Corp. 1-2-3 spreadsheet also attracted Pergament to the package. "Instead of forcing you to go into some type of micro package you don't want, M&D made a commitment to go to Lotus, which has become the industry standard. Many 1-2-3 users don't want to take the time to learn another package. They don't need anything else," he said.

Pergament has three PC Links installed now and has plans for more. The budgeting application is being worked out. The most time-consuming task is defining mainframe production data into fields, files and lengths appropriate for use on the Personal Computers. "If you try to download too much data, you send your [Personal Computer] into a coma," Pergament commented.

Training users on PC Link, especially users unfamiliar with M&D's Millennium on-line applications development system, also takes time. "Users have to make an effort to learn the intricacies of this package," Pergament said.

An Albuquerque, N.M., bank plans to use PC Link to connect executives on a local-area network to production data, said Jerry Smith, senior systems analyst at the Albuquerque Federal Savings and Loan. Like the other users, the bank is currently using the link to help prepare budgets. Four link packages have been installed, the first in early 1984.

A total of 25 subsidiary companies submit their budgets to Smith's group, which is linked to an IBM 4381 mainframe running MVS. The analysts work on the budgets in 1-2-3 then send them back up to the mainframe, Smith said.

The bank's latest PC Link project is to link the executives in a 10-node network, five in one building on a local-area network and five in another building on dial-in lines. "The thrust is to get information off the mainframe and into management's hands, 'to be available at any time with very little impact on data processing," Smith said.

The managers, including the company president, will access a version of the data base to be updated weekly, he said. For the executives' purposes of planning and evaluating how efficiently the company is operating, a once-a-week update is sufficient, Smith said.

For updated versions of PC Link, Smith said he hopes M&D will offer users a way to share templates they have prepared for use with 1-2-3. An M&D spokesman said the PC Link development effort is aimed at linking the IBM Personal Computer to minicomputers, and then linking the minicomputers to a mainframe.

CICS Users:
To increase uptime and control your file availability . . .
Challenge DADS.

CICS Initialization

- Allocates all user and transient data files
- Eliminates CICS downtime if files can't be allocated
- Supports all CICS startup options
- Requires no modifications to CICS

CICS Real Time

- Allocates/deallocates user and transient data files
- Allocates/deallocates files by groups
- Automatically opens and closes files
- Automatically enables/disables transactions and programs
- Provides security exit and audit trail

Advanced Features

- Automatic time-initiated allocation/deallocation
- Batch interface
- O/S core manager

WHEN YOU WARE THESE HOT NUMBERS BY UCCEL, SUCCESS IS AUTOMATIC.

AUTOMATE YOUR PRODUCTION WORKFLOW WITH UCC-7 AND UCC-11, AND YOUR DATA CENTER ALMOST RUNS ITSELF.

IT'S THE NEW 10,000 BPS DIAL-UP MODEM THAT'S BREAKING ALL RECORDS FOR SPEED AND ACCURACY.

You didn't read that number wrong. IRMA's Fastlink, the new high-speed asynchronous modem for IBM and most compatible PCs, can send data at 10,000 bps, more than eight times faster than ordinary 1200 bps modems.

Available both as a plug-in card and as a standalone unit, Fastlink is both 212A and 103 compatible. That means it will slow down automatically to accommodate Hayes modems.

But Fastlink isn't just fast. It's also accurate. Its unique technology gives you error-free transmission over all types of lines, even those lines with high noise levels.

In fact, if inferior line quality does necessitate a lower transmission rate, Fastlink does something other high-speed modems can't do. It adjusts its speed incrementally, a few bps at a time. So you can continue to transmit at the highest speed possible. Other modems now on the market drop their speeds dramatically, or even worse, stop transmitting altogether.

What's more, Fastlink works with the new Crosstalk-Fast,™ an enhanced version of the popular Crosstalk-XVI® software that has established itself as a leader in communications.

So you don't have to experiment with new communications software.

Finally, Fastlink comes to you from the people who gave you IRMA,™ the most successful PC-to-mainframe communications link in the world.

In short, Fastlink is fast, accurate and easy to use. And it's compatible with your way of working.

The bottom line is this: Fastlink lets you reduce transmission costs while you increase your productivity.

Call 1-800-241-IRMA to find out more about the new modem from DCA that's leaving the competition in the dust.

M&D link eases reporting

age. We didn't have that kind of money." The micro-mainframe selection was budgeted at less than $30,000.

The two-month search for a solution to Orion's problem began in October, and soon the list of potential products was reduced to six. Price comparisons and vendor visits helped Stein narrow his selection.

He also considered the company's ultimate objective to allow remote users in four divisions to access mainframe data for their own spreadsheet analysis.

Recommendation made

In January, Stein presented management with a 14-page report comparing micro-mainframe products and recommending McCormack & Dodge Corp.'s Interactive PC Link.

The product allows microcomputer users to transfer portions of foreign files into a variety of spreadsheets, including 1-2-3.

But his job was not complete. Now Stein had to convince both users and management that the product could be supported.

Emphasis on training

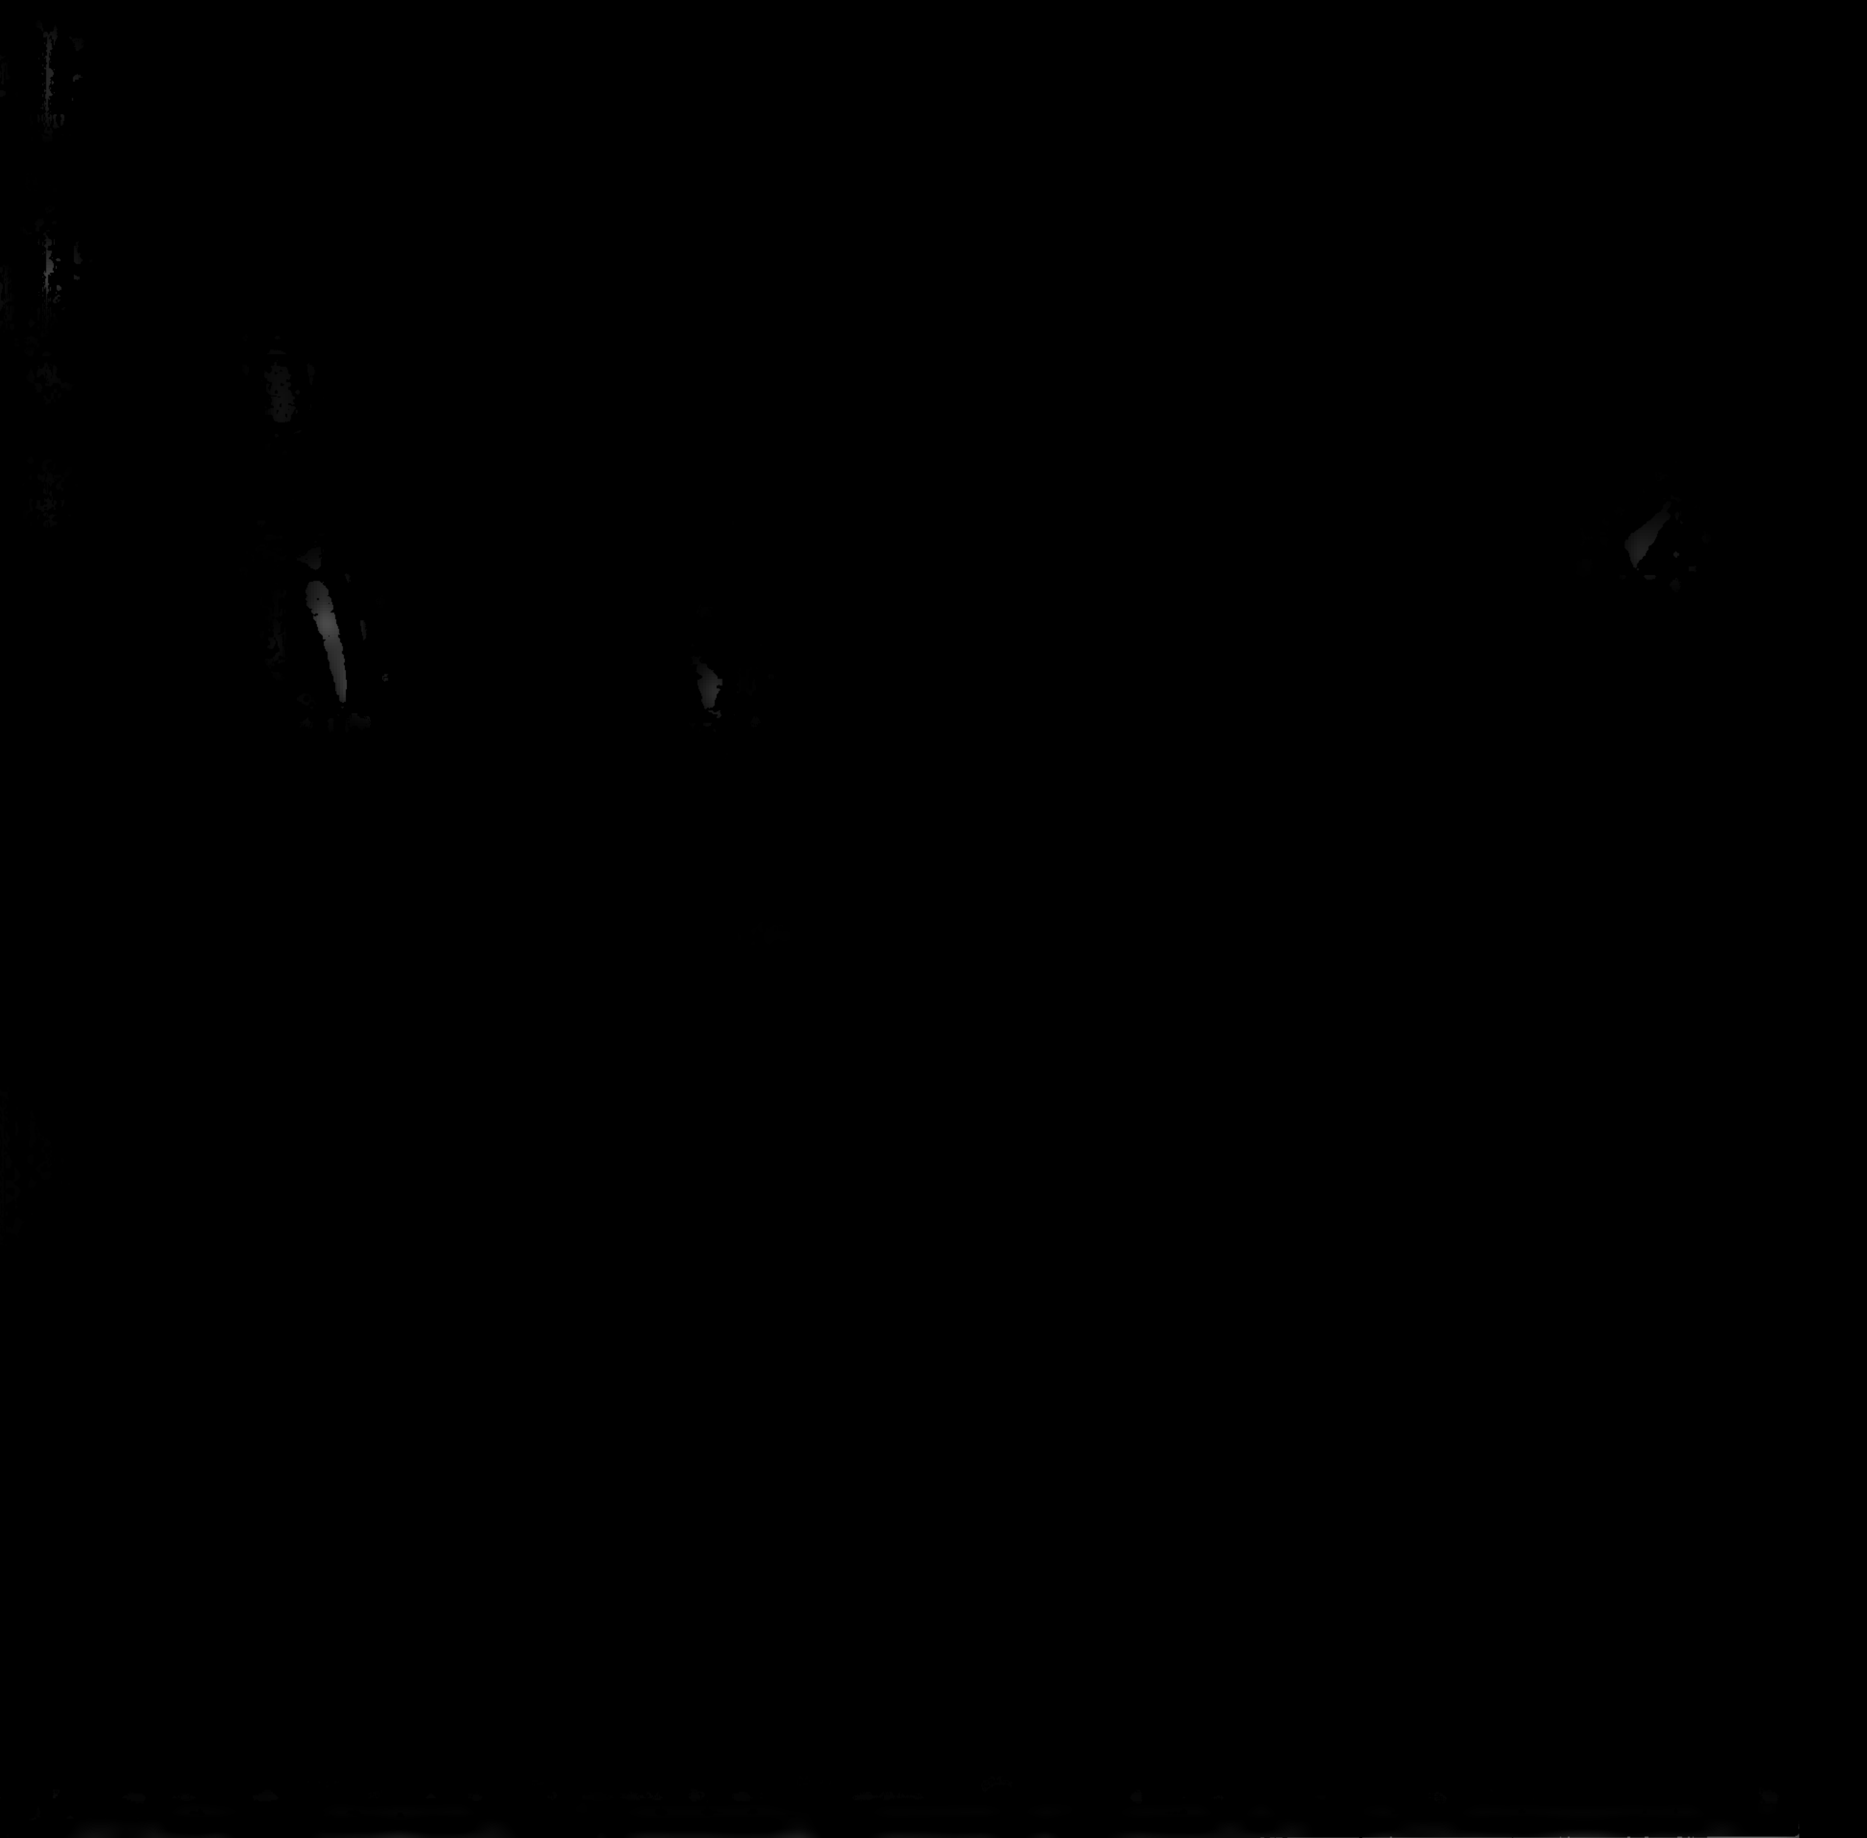
"One of the main reasons we got the product was not because it was clearly better," he said. "But it was the fact that we had a lot of assurance from the company that they were going to support us in everything we wanted to do." According to Stein, "I didn't want one product that we thought was outstanding because training wasn't a big issue to the vendor. In a start-up information center environment, training is a big thing in my book."

PC Link was more expensive than some of its competitors, Stein admitted. "I had a little explaining to do with management, but I pushed the training issue." Orion's workers needed a structured classroom environment. "I feel the best training anybody can give is in a classroom, where people can ask questions. You don't get that out of a demo disk." And, he added, "Management doesn't want something that costs $20,000 that no one will use."

The micro-mainframe link was not always a welcomed solution at Orion, according to Stein. "There was a lot of negativism," both from management and users, he said. Orion overcame some installation problems, with the help of M&D service technicians, he said.

"Everybody thought they could install it themselves," Stein noted. "The financial group thought they could do it, and the technical support people thought they could do it. We needed the help of the vendor."

For the analysts in Orion's financial group, PC Link has meant that less time is spent generating financial reports. Before installing the product, two workers spent two weeks each month generating financial reports, according to Richard Tardif, vice-president of financial information. "A lot of people were keypunch operators," Tardif said. "I look at this as a great tool to get us out of the manual sweat work."



Unfortunately, information managers don't have such job security.

Even though they make decisions just as tough. Decisions where millions of dollars and thousands of man hours are at stake.

These days, the most difficult decisions involve personal computer installations and configurations. Hardware and software products appear on the market daily. Others disappear at a similar frequency. Making it imperative to purchase systems that while state of the art, can put you in a state of security.

That's why it makes sense to go with DunsPlus. DunsPlus offers a customized standard. A personal computer system that gives you the stability of IBM with the innovation of Lotus and other leading software companies. All in a consistent, menu-driven operating environment that received Software Digest Ratings Newsletter's top rating for integrated programs that run on IBM PCs.

DunsPlus offers you the choice of any IBM PC already configured with proven software programs such as 1-2-3 and MultiMate or DisplayWrite word processing. Plus additional software tools for data integration, file management, micro/mainframe communications, and systems development. Assuring that your PC investments never lose their value.

DunsPlus. Like NOMAD2, the premier 4GL/DBMS, it's one in a continual evolution of computer software services from Dun & Bradstreet.

To assure that your PC judgements are supreme, write DunsPlus, 187 Danbury Road, Wilton, CT 06897, or call 800-DNB-PLUS.

DunsPlus

We make PC products work the way they should. Together.

SPECIAL REPORT

Minis and Small Business Systems

September 30

The September 30th Special Report will take a close look at the minicomputer and small business systems market. We'll discuss the latest trends in minicomputer architectures and examine the evolving supermini market. And we'll cover what's happening in the supermicro market and how it's affecting the mini market. We'll include reports from users on the problems that they encounter in selecting and implementing minicomputer systems and the solutions they discovered.

Computerworld's user subscribers are heavily involved in the purchase of computer systems —82% make purchase decisions for minicomputers and 84% are involved with the purchasing of small business systems for their organizations.

If you want to reach Computerworld's audience of 687,000 computer-involved professionals with information about your superminis, minis, supermicros or small business systems and any related products or services, this is the place to be. Computerworld's Special Report on Minis and Small Business Systems.

Reserve your space for the September 30th issue today. Simply fill out the coupon below and drop it in the mail. Or call Ed Marecki, Vice President/Sales, at (617)879-0700 or your local sales office. But hurry, the closing is September 13th.

Advertising close: September 13

☐ Yes, I want to reach buyers of minicomputers, small business systems and related products or services. Reserve space for my ad in the September 30th Special Report issue.

A breakthrough idea
from the past that's changing
the future of the
computer software industry:

NATU
SELEC

Nothing survives or flourishes unless it can adapt to a changing environment. And no environment is changing faster than that of the computer software industry. That's why Martin Marietta is calling on a breakthrough idea from the past to guide us as we develop our services and products for the future. That idea is Natural Selection.

The computer software industry is in a state of chaos. Hundreds of companies are providing hundreds of solutions. To hundreds of individual problems. With no coherence. No cohesion. And no coordination. But business problems don't exist in isolation. So isolated solutions have limited value. As life forms change and develop and grow in conjunction with one another, so must your information management solutions.

Your information management system must work regardless of what machines or operating environments you use. Regardless of the applications you develop. Regardless of the relative sophistication or inexperience of all your users. Your system must evolve and develop naturally, with all its parts relating to a common whole. At a pace appropriate to the unique demands of your own company.

URAL
CTION©

So to provide our customers with this kind of information management system, our company is changing too. We've brought together three leaders in software: Oxford, Mathematica and Martin Marietta Data Systems. A merging of companies and of minds from different disciplines, sharing resources and skills of a technology intensive Fortune 100 corporation. To provide the kinds of solutions today's complex business problems demand.

Some of our competitors offer a "total solution" approach. Which would be fine if your company's needs didn't change. Some offer a "grab bag" of individual solutions. Which would be fine if your company's problems existed in isolation.

But we, at Martin Marietta Data Systems, have chosen another way. Natural Selection. A natural selection of products and services which develop and grow and change and interact with one another. None a revolutionary break from ancestors, but a natural outgrowth and evolution. Each appropriate to its own use, but interrelated with all others.

Natural Selection. The path we've chosen to ensure our company's continued innovation and success and growth. And that of our customers.

Thank you, Mr. Darwin.

NATURAL
SELECTION®

Products for the future, here today:

Martin Marietta offers an impressive and growing family of Natural Selection™ products. Each uniquely suited to its specific purpose, but immensely flexible and adaptable to a variety of machines, operating environments, applications needs and degree of user sophistication. Products designed to work in easy conjunction with one another, both now and in the future.

For the information center:

RAMIS® II. An integrated information center system that lets end users develop everything from simple reports to complete personal applications.

MAXICALC™ II. An online electronic spreadsheet giving 3270 terminals the capabilities and friendliness formerly found only with PC spreadsheets.

For applications development:

CONSENSUS.™ The first online development tool to resolve the competition between machine resources, programmer time, and end user demand.

RAMIS® II. The most comprehensive and widely-used batch and interactive applications development product ever created.

COBOL/XE.™ A CICS applications development tool to develop programs in everyday COBOL.

For business applications:

MAS-MANUFACTURING.™ A total closed-loop MRP system integrating all critical elements of the manufacturing operation: planning, scheduling, production and evaluation.

MAS-FINANCIALS.™ A complete online, real-time financial system of eight integrated modules.

MAS-HUMAN RESOURCES.™ Comprehensive integrated systems designed to eliminate the drudgery of manually creating personnel records while automating virtually every aspect of payroll accounting.

MAS-DECISION SUPPORT.™ Gives end users extensive reporting and analytic capabilities for the MAS family of applications products.

For the microcomputer:

ITSoftware.™ A professional series of data management, word processing, spreadsheet/analysis and communications programs.

RAMIS® II/UNIX. The effective way to bring the full power of RAMIS II to the portable UNIX* environment.

pcMAINFRAME.™ The intelligent file transfer system that allows PC users to download and upload data without programmer assistance.

PC/REPORTER.™ An advanced reporting system that easily builds ad hoc and production reports with either commands or menus using both downloaded mainframe and PC data.

UNISON.™ The first workstation tool to combine a PC's ease-of-use with the mainframe power of RAMIS II.

For data center services:

ORLANDO 4000,™ The Computer Condominium. A complete data center providing the most up-to-date computing services on a unique fixed-price basis. Thereby providing companies with the classic make vs. buy decision.

For additional information on any Natural Selection product, call 1-800-257-5171 or write Martin Marietta Data Systems Product Information, P.O. Box 2392, Princeton, NJ 08540.

IN DEPTH

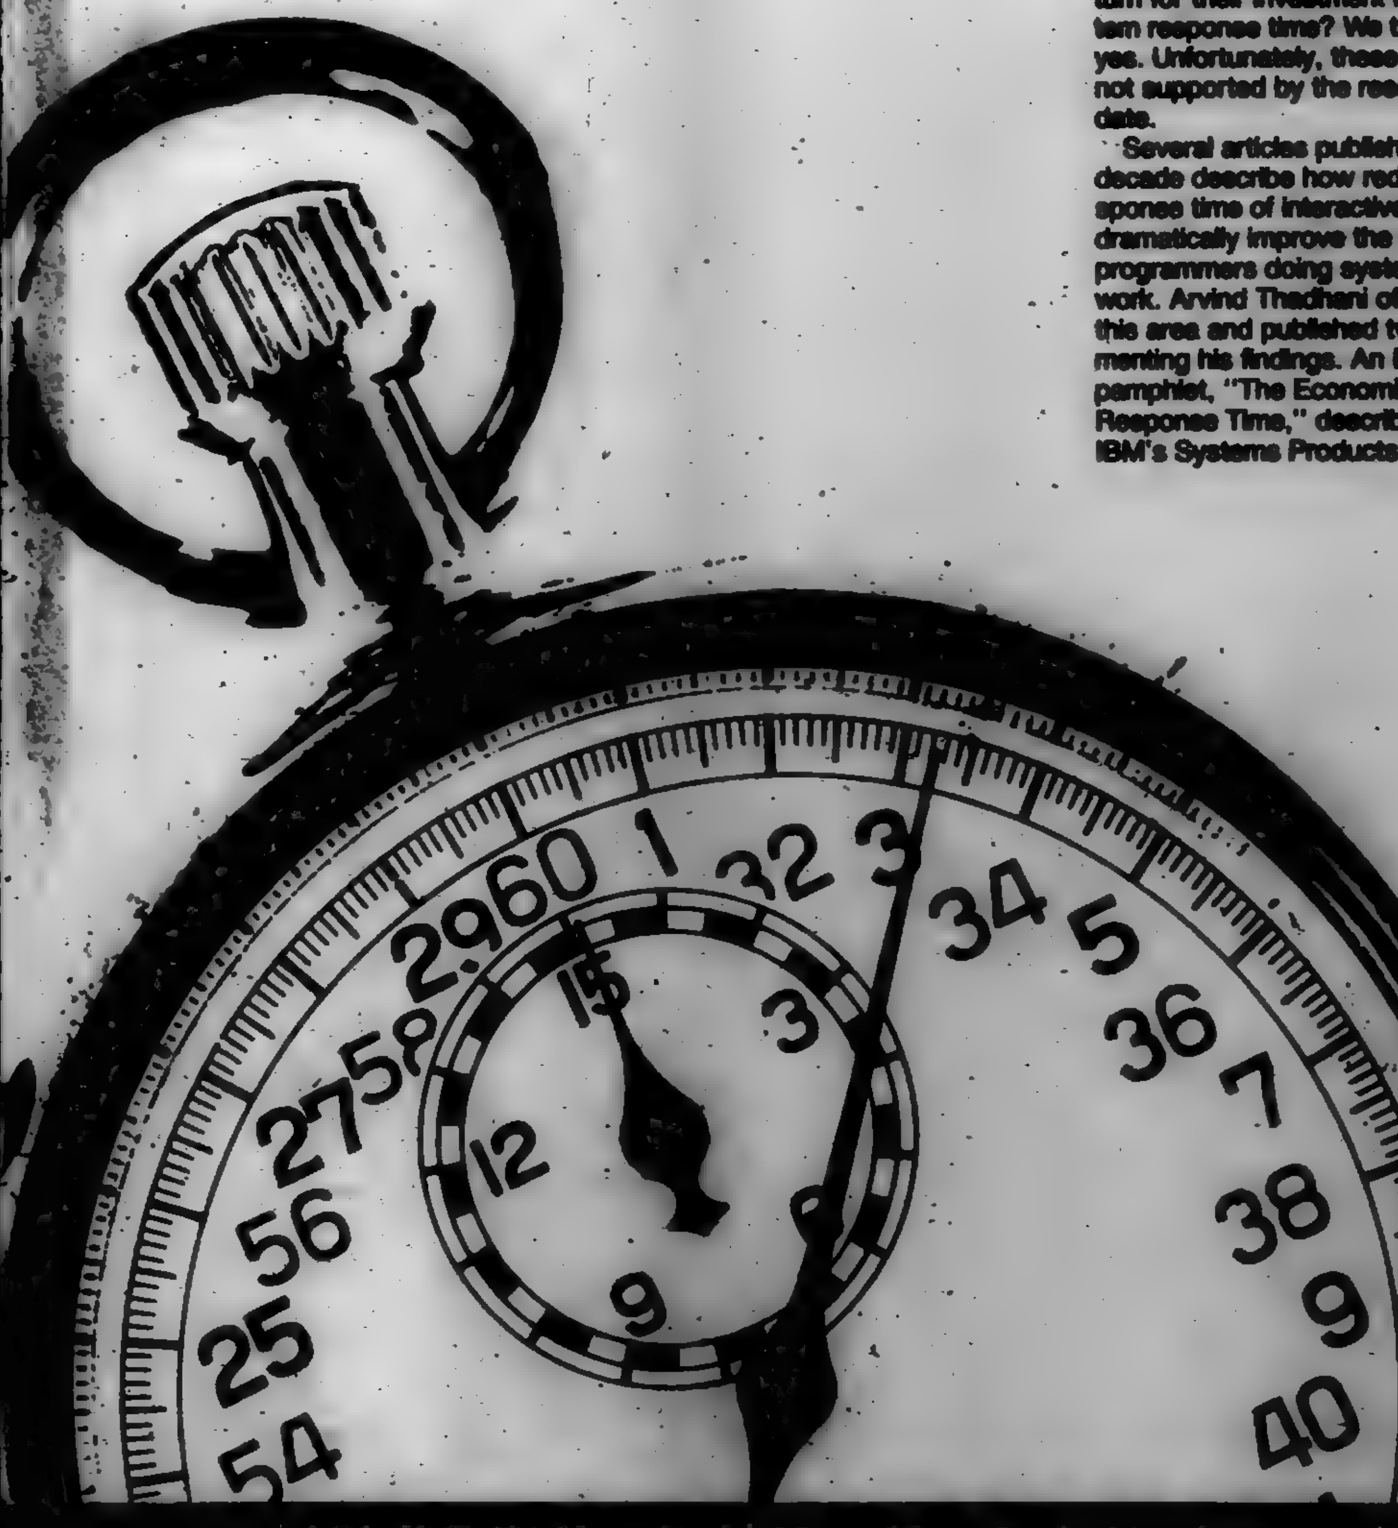
Are you rushing too fast to subsecond response time?

Can subsecond response time increase programmer productivity in your systems department? Is it worth the investment? Corporate managers must understand the research upon which claims are based before answering these questions.

By H. Thaine Lyman,
James Anderson
and Jeffrey Plewa

Are MIS managers expecting a magical increase in programmer productivity in return for their investment in subsecond system response time? We think the answer is yes. Unfortunately, these expectations are not supported by the research done to date.

Several articles published in the past decade describe how reducing the response time of interactive systems can dramatically improve the productivity of programmers doing systems development work. Arvind Thadhani of IBM pioneered this area and published two articles documenting his findings. An IBM marketing pamphlet, "The Economic Value of Rapid Response Time," describes experiments at IBM's Systems Products Division and the



company's program development facility at Portsmouth, England. The experiments purport to show significant productivity increases from improving response time. The pamphlet projects savings of up to $300,000 per month for a hypothetical 100-programmer group that reduces response time from 3 seconds to 0.3 seconds.

In systems departments, emphasis has shifted from evaluating and trying to confirm the claims made for subsecond response time toward implementing it to achieve the benefits — as though the question of benefits is settled. Many MIS managers have either adopted subsecond response time or are justifying it to top management.

One company has published an internal subsecond response time standard as an inducement for new programmer recruits to join up. Another has proposed a hardware expenditure in excess of $150,000 per month to secure the productivity increases expected from subsecond response time. These activities are taking place even though published research cautions against a simplistic application of findings and underscores the need for further applied study.

> ”
>
> ***Many organizations would have to double the resources available to development in order to achieve the subsecond response goal.***

The stakes are high. As reported in the 1984 *Statistical Abstract of the United States*, there are nearly one million computer professionals now employed in the U.S. If as many as one-third of that number regularly engage in on-line programming, the impact of subsecond response time could mean billions of dollars annually in improved productivity. The costs of subsecond response time are similarly high: Many organizations would have to double the resources available to program development in order to achieve the subsecond response goal.

The impact of any systems productivity improvement will be visible. Firms in all industries increasingly depend upon computers for survival in markets where information and instantaneous service are crucial. Organizations' demand for computing is growing at an estimated 40% to 60% compound annual rate.

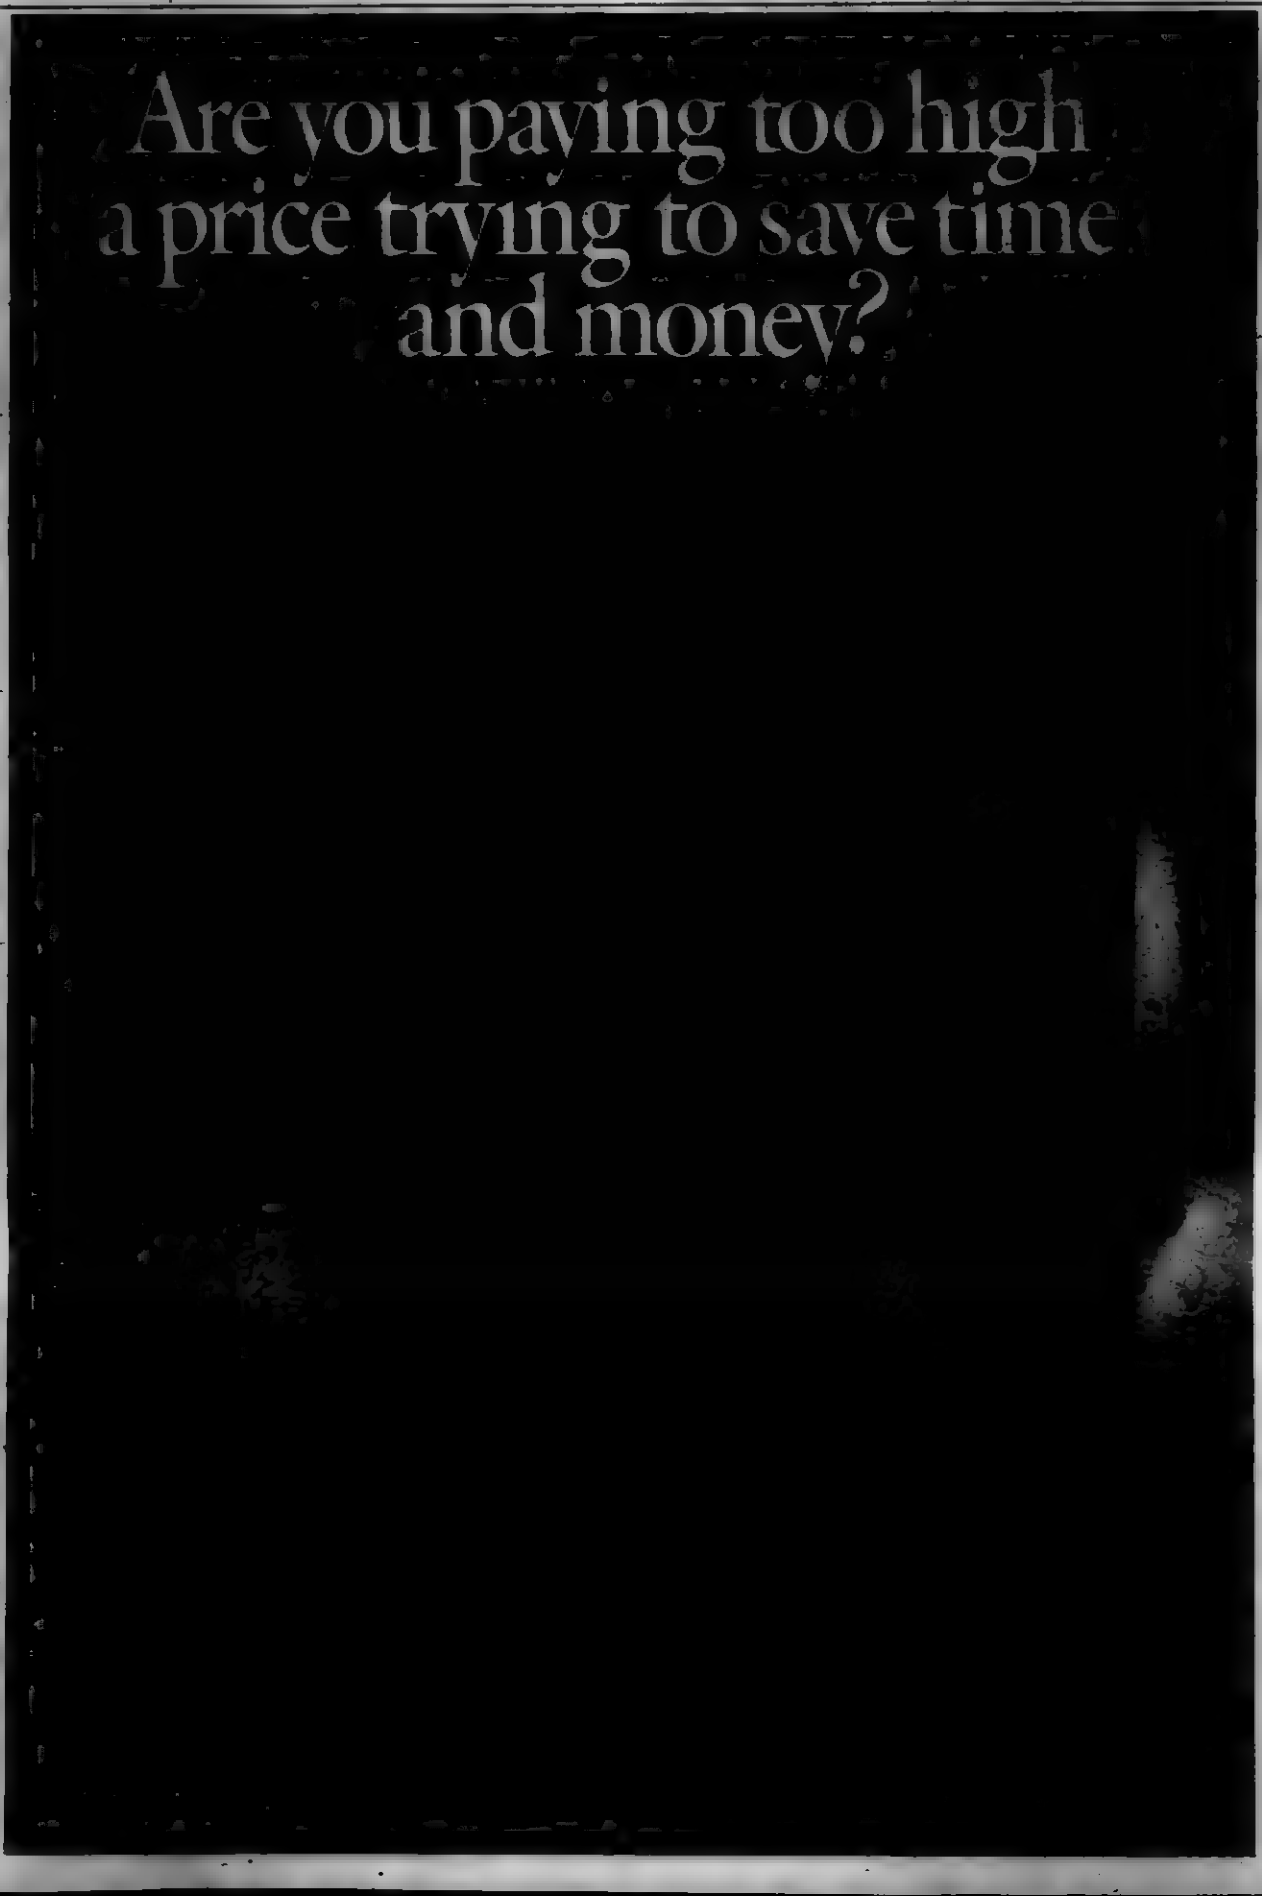
But the backlog for systems development projects is growing faster. One recent study found that the average waiting time for a project to be delivered has grown to more than two years from only 1.5 years in 1981.

Systems development managers are in the vanguard of those proclaiming the benefits of subsecond response time as a way to leverage their staff resources to greater throughput, shorter project times and smaller budgets.

Can subsecond response time increase programmer productivity in a systems department? Is it worth the investment? Corporate managers must understand the research upon which claims are based before the answers to these questions can be known.

The research

Thadhani's first experiment began as an unstructured exploration into the effects of system response time on computer user behavior. No experiment design or objective was stated in the article discussing his results. He studied two MVS/TSO environments passively. (No changes were introduced



Are you paying too high a price trying to save time and money?

IBM/38-36 BACKLOG REDUCTION

The world's most successful companies have made Fusion Products Intl. the leading supplier of query/report-processor and spreadsheet software for the IBM/38-36. Call 415 461-4760 or write.

into either environment by the experiment).

Thadhani finds that the number of transactions initiated by users increased by more than could be accounted for solely by the additional time available from quicker transactions. He concludes that this finding was caused by a decrease in user "think time" per transaction.

He reasons that if users complete the think time necessary before the next transaction in fewer seconds, they must be thinking more efficiently. This phenomenon was attributed to the slower decay of the "short-term mental memory buffer" mentioned in an earlier article. Productivity was assumed to increase based upon these results.

Thadhani, in a later article, also describes another effort to show the salutary effects of "good computer services." A project team was given subsecond response time, their own terminals, a private room (necessarily close to the machine room because subsecond response time was achieved through local connection of terminals), 15-minute test job turnaround time and high availability on the computer dedicated to program development and testing.

No attempt was made to isolate these variables. The author assumes that it was not possible to conduct a controlled experiment in which subsecond response time was the only variable.

Thadhani draws no quantitative conclusions regarding the effect of subsecond response time on programmer productivity. A summary finding of improved project productivity was reached: "These achieved productivity rates are significantly higher than those achieved on similar projects within IBM."

Productivity improvement

G.N. Lambert, writing in the *IBM Systems Journal* in 1984, reports on an experiment conducted in 1983. A group of systems developers was given an isolated project room, their own terminals and subsecond response time.

Based upon a measure of function points estimated to be involved in a project and "highly reliable" estimates of what the project would have required had it been undertaken with normal systems service, users with subsecond response time demonstrated substantially greater productivity than their counterparts with normal service.

Function points measure the complexity of a programmer's task. Point values are assigned to the program based upon the number of generic tasks the program performs, such as number of I/O files and number of computations. This method allows the work necessary to produce different kinds of programs (such as on-line vs. batch) to be compared on an equal basis.

Lambert documents a 58% improvement in productivity as well as a probable improvement in project quality (measured in number of trouble reports). The improvement in quality is attributed to what could be called a "synergistic effect" of subsecond response time and environmental factors. Programmers in the experimental group also provided highly positive feedback in subjective interviews after the study. Lambert states that the IBM unit where the project was conducted has since decided to install subsecond response time combined with private team project rooms in other program development centers.

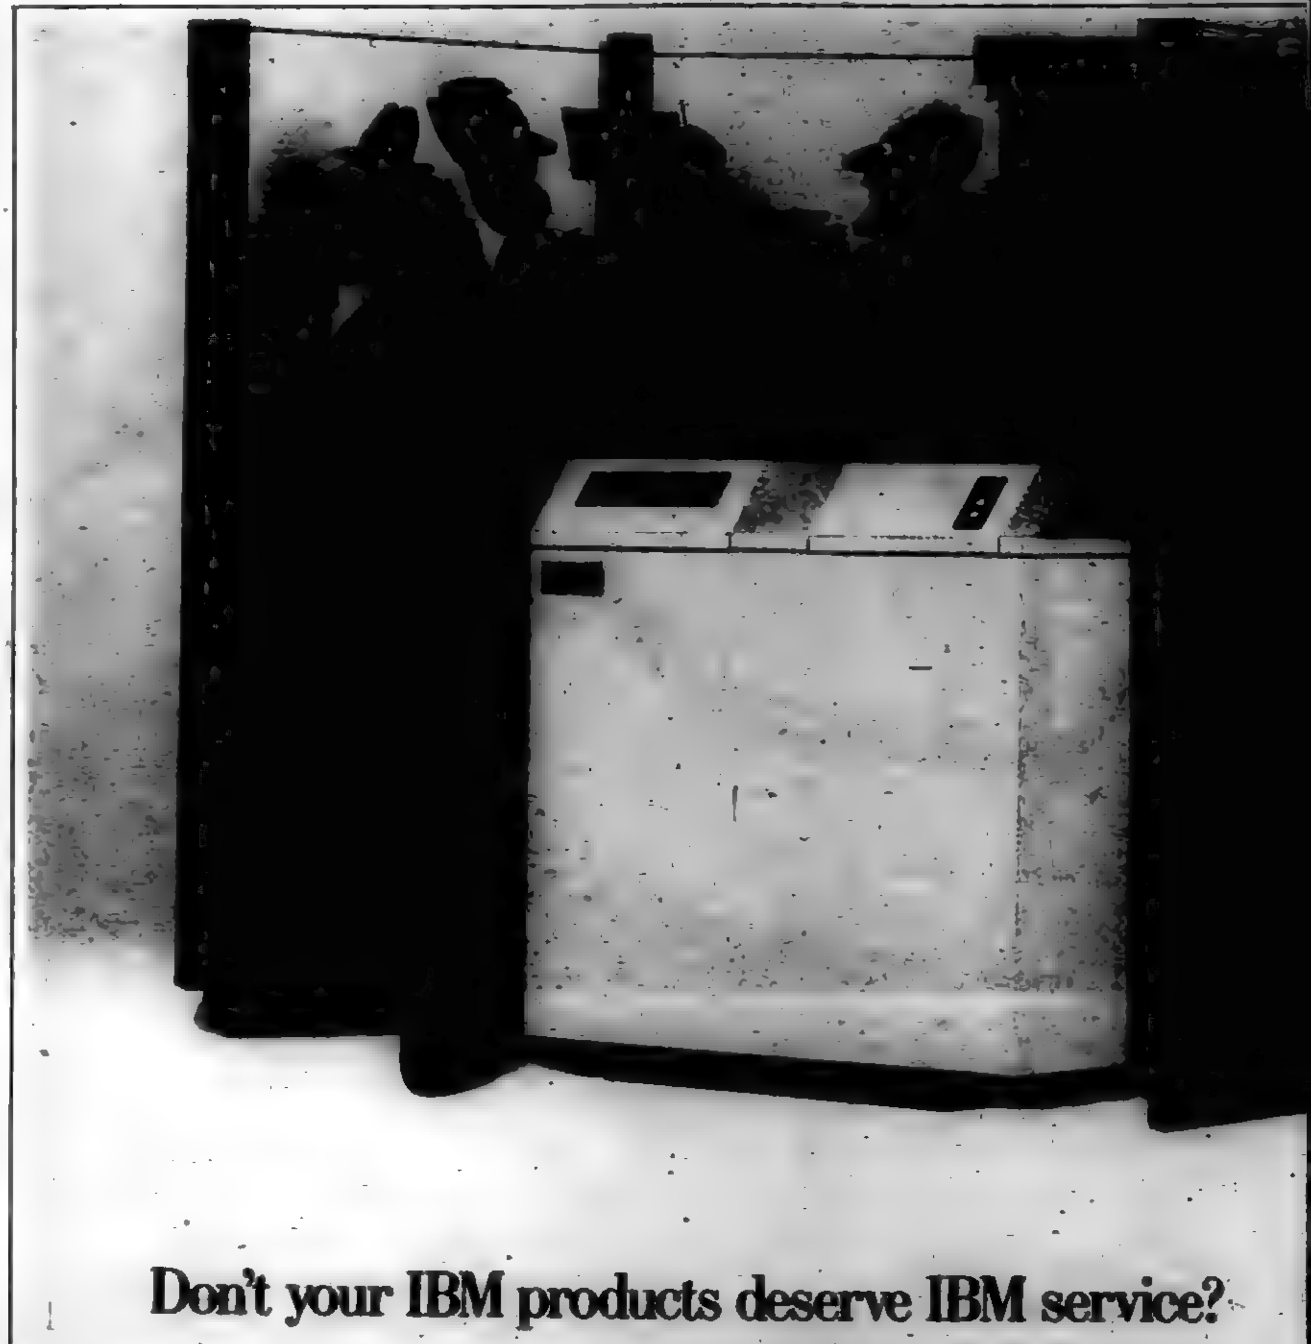
> ❞
>
> *In systems departments, emphasis has shifted from evaluating and trying to confirm the claims made for subsecond response time toward implementing it to achieve the benefits — as though the question of benefits is settled.*

The IBM marketing pamphlet mentioned earlier summarizes a study of engineers performing card-wiring tasks using graphics display terminals. The work of 15 engineers of varying levels of expertise from four laboratories was measured. Although no comparisons were made between card wiring and systems development, productivity of the engineers, measured by number of transactions per hour and total time required to complete a wiring task, went up dramatically.

Lawrence Kosmatka, in a 1984 *Computerworld* article, describes efforts to duplicate Thadhani's results. His company installed subsecond response time attempting to achieve the published benefits. At various stages of enhancements, Thadhani's results were duplicated. At the end of the project, however, the systems development manager saw no substantive improvements in project completion times or budgets.

Kosmatka delved further into his data and discovered evidence of a "statistical illusion," which he suspected might be present in the previously published research.

Kosmatka finds that users modified their behavior or usage patterns of transactions as response time improved. While causality between the observed behaviors and subsecond response time is not proven, a substantial correlation is evident. Given subsecond response time, users significantly increased the percentage



Don't your IBM products deserve IBM service?

You chose IBM products for lots of good reasons. And now that you depend on them to help keep your office running smoothly, doesn't it make sense to help protect your investment with blue chip service from IBM?

Whether you have an IBM Personal Computer or one of our larger computers, blue chip service is more than just expert repair.

Blue chip service means a lot of things you don't see. Quality. Speed. Commitment. And IBM experience. Every year IBM invests many hours of training to keep its service representatives current on technologies that never stand still.

Then there are our extensive data bases used to help identify common problems

> *Conclusions about productivity enhancers in the DP professional's environment need to be correlated with the tools, work patterns and activities of the future rather than the editing-oriented coding of the past.*

of one-character transactions they executed.

He also finds that as system response time improved, reaction time sped up. Although Kosmatka does not generalize about the observations, one could conclude from his results that subsecond response time causes users to think less and press the Enter key more — a quite different conclusion from that drawn from the other articles.

Kosmatka concludes that Thadhani's "think time" improvement is an illusion; in fact, user think time appeared statistically unrelated to subsecond response time in Kosmatka's data.

Furthermore, Kosmatka finds that reaction time actually improves as system response time improves, resulting in real productivity saving (although much smaller saving than is attributed to "think time" improvement in earlier research) of "several tenths of a second." This particular finding is most pertinent to users of systems in which reaction time is a key component.

The IBM engineer card-wiring environment might be such a system with its higher routine content; a comparison of its results with Kosmatka's supports a conclusion that subsecond response time is most beneficial in a routine, production-oriented environment.

A study of the impact of response time on data entry performance by T.W. Butler further supports the conclusion that improvement in system response time has a more direct benefit in routine systems applications than in more general or "cognitive" situations such as applications development.

In an experiment conducted at Bell Laboratories, Butler found that there is a relationship between average system response time and user performance rather than between the most recent system response time and performance, contradicting the premise of short-term memory decay proposed by Doherty and Kelisk.

The authors of the published research all caution against a naive application of their results, citing the need for improvements in experiment design and measurement of the impact of subsecond response time. Managers should heed these cautions and understand the weak points in the research before applying subsecond response time in their own installations.

Problems with the research

Existing published research on the benefits of subsecond response time has several weaknesses. These weaknesses are especially important in light of the magnitude of the investments in productivity enhancement that data processing executives are being asked to make. Six major weaknesses exist in many of the studies and in documentation published to date:

- Mixed experimental factors
- Overemphasis on coding as the critical activity
- Ambiguity concerning the measurement of productivity
- Questionable methods of data aggregation
- Oversummarization of statistical results
- Omission of relevant variables.

Perhaps the most serious problem with many of the experimental results is the obvious mixing of variable factors controllable in the environment. In several studies, subjects were given not only subsecond response time but also a new, quieter work area, a team workroom and private desk terminals. Productivity improvements were measured, but were they caused by subsecond response time, the quiet workroom, private terminals or some other variable?

In this situation, perhaps nothing more exotic than the "Hawthorne effect" may have led to many of the observed improvements. This effect describes an artificial change in employee productivity or attitudes because the employees sense the company is paying more attention to them or is trying something novel.

Coding activity has been a central focus of much of the published research, yet coding seems to be a shrinking part of the DP professional's workload, while use of efficiency tools such as application generators and "programmer tool-kits" is on the rise. Such tools permit significant work to be accomplished with only a few commands or terminal transactions at a cost of higher per-transaction resource requirements.

The published research does not give insight into whether productivity benefits vary depending upon the use of such "advanced application development" tools. Conclusions about productivity enhancers in the DP professional's environment need to be correlated with the tools, work patterns and activities of the future rather than the editing-oriented coding activities of the past.

Methods of measuring productivity vary among the different research efforts. We favor the function point approach. Measurements that focus

and their solutions, and a computer-based parts distribution system. They all go to make IBM service blue chip.

Blue chip service offers the choice of service that's best for you at the price that's best for you. For the IBM PC, for example, we offer service at your place or through any of our Service/Exchange locations.

As an IBM customer, you deserve blue chip service. It's the best thing you can do for your IBM products.

To find out more about the specific service available for your IBM equipment, call 1 800 IBM-2468, Ext. 90.

Blue chip service from

on keystrokes, transactions or other work-oriented variables have less credibility as productivity measures than as results-oriented function point measures.

Methods standardization

Different statistical methods are used in each study to boil down the large volume of data collected; that is, to eliminate inappropriate or suspect data and aggregate the remaining data into summary observations. These methods should be standardized for purposes of comparison.

Many adjustments to correct for bias in the raw data are not well supported. Looking at the "before and after" picture of a whole group of users for major periods of the day is only one possible approach to data aggregation. Use of a different technique — such as looking at individual users' productivity changes — might be more relevant.

We favor a measurement approach that focuses on each programmer's productivity before and after subsecond response time. Two groups of programmers — one control and one experimental — would be compared using an approach measuring before and after results for each programmer rather than the sum of all programmer productivity.

It is also important to measure all the relevant variables that describe the type of work being performed on any given terminal session. Kosmatka's data, showing the number of one-key transactions and how it changes with the implementation of subsecond response time, vividly demonstrates how measuring related variables can add a new perspective to experimental data.

People are quite different in their use of the terminal as a productivity aid. These differences are in "style," degree of preparation, use of sophisticated features or labor-saving techniques and so forth. Experiments must take such differences into account to be relevant to management's decision to invest or not invest in subsecond response time resources.

The published research has unquestionably pioneered our knowledge and understanding of the environment of the interactive terminal and its impact on productivity. Future inquiries should build on, not discard, what has been done. However, experimental results must be recognized to have been generalized prematurely to support computer purchase decisions.

Alternative enhancers

The discussion above is meant to refocus research activity on obtaining the most relevant insights possible into the complex world of systems development. It also should serve as a warning to managers that great care must be taken in applying published results to their own departments. We believe that systems managers should evaluate a variety of cost-effective strategies discussed below to increase systems development productivity.

Though per-unit hardware costs are declining, the implementation of subsecond response time is still very expensive. Personal costs are consuming an ever-growing share of the DP budget. Effective utilization of personnel is fundamental to planning and management in a well-run MIS department. Before spending huge amounts on hardware improvement, it is advisable to investigate alternative ways of improving productivity.

Programmers view the computer as a tool. Their satisfaction with this tool may affect programming productivity. The major factors that determine satisfaction with computer service are subjective and include the following:

- Reliability — The system must not go down in the middle of a complicated on-line debugging session.
- Availability — The system must be available according to a posted schedule (not necessarily around the clock).
- Timeliness — The system response must be, at minimum, as fast as the programmer expects it to be.
- Quality — The system must possess the power and sophistication demanded in today's complex systems development setting.

Satisfaction with computer service is an aggregate of subjective factors. Any deviations from expectations about reliability, availability, timeliness and quality are noticeable and may be considered unacceptable.

The rush to Revelation® has just begun.

When ordinary database management software isn't enough, enlightened users are switching by leaps and bounds to Revelation, the complete database and applications environment.

That's because Revelation includes powerful tools to create applications in no time. Plus advanced features that help users get the most from their system day in and day out.

For software developers, there's a powerful applications generator that builds files, fields, menus and reports.

For corporate users, Network Revelation is already off and running on both IBM's® PC Network and any hardware running Novell NetWare.™

For hard-core programmers, Revelation's R/BASIC procedural language combines the best of BASIC with the structure and logic of C.

And for everyone, there's an advanced query language and report writer that's fluent in everyday English and eager to learn new expressions.

The secret is incomparable technology: variable-length fields to conserve precious disk space; unlimited files, fields and records; data dictionaries that make it easy to change your database when you change your mind; plus a high-speed compiler to accelerate program execution. And, of course, conversion utilities for dBase II® and Lotus 1-2-3™ are included at no extra cost.

Revelation isn't for everyone. But if you're ready for a database management system you'll never outgrow, [illegible] to your nearby dealer.

Ask for an unforgettable demonstration of Revelation's superior capabilities.

[illegible]

COSMOS™

Cosmos, Inc., [illegible] Pacific Highway S. Seattle, WA [illegible] [illegible]

We believe that the key is to manage the expectations of the programming staff and to meet those expectations. Where system response time is concerned, is it not possible that the critical component in the measurement of programmer satisfaction is reliability of system response time rather than its sheer speed?

The programmer who consistently receives 1.5 second response time will, with all else equal, be more satisfied than the programmer whose system response time varies between 0.25 and 1.5 seconds. This view is based upon our observation that perceptions about response time may have more impact on programmer satisfaction than does numerical data. We have seen departments where programmer perceptions about system response time (in other words, it's "getting worse") are opposite of measured reality.

Environmental effects

There are numerous books, articles and papers devoted to productivity in the work environment. Researchers studying various settings have identified environmental factors that can affect productivity, such as lighting, room temperature, size of work space and proximity to other workers. Other studies have shown a link between productivity and the color of walls, carpeting and cubicle partitions.

These findings should lead the MIS manager to investigate the physical work environment of the MIS staff. Noisy printers or hallway traffic make concentrating on complex programming problems difficult. Partitioned cubicles and team meeting rooms can enhance the problem-solving process.

Another option is a project team programming room. Here, the interaction among programmers can increase productivity because team members "share knowledge."

Every study reviewed in this article provided a terminal for every user. Many companies are concerned that hundreds of thousands of dollars per year are wasted by programmers wandering around their MIS departments looking for an available terminal.

A terminal on every desk

Putting a terminal on every desk may be a relatively low-cost way of increasing programmer productivity. A programmer with a test job waiting for execution in a queue is more likely to monitor it closely if he can glance up occasionally and see its progress.

A terminal gives the programmer the luxury of immediate access to all tools, manuals, program listings and specifications required in the normal programming cycle. Programmers can work on documentation or research another problem while waiting for a job to finish execution. They know at once when the job is complete; they can review results, recompile the program if necessary and then resubmit the program for execution. Not having to walk back and forth between terminal and desk reduces the amount of time required to complete the programming task.

The basic disciplines of project management may be even more fundamental to productivity than the physical environment. Failure to employ certain basic management practices can often severely hinder the productivity of systems development staff.

> *We have seen many cases where simple before-and-after analyses are not done, where 'planned vs. actual' is not calculated and where 'this year compared to last year' is not understood. Such organizations know nothing of performance variance, much less the causes of the variance.*

Some common pitfalls include poor communication, poor personnel development, vague project goals, poorly defined responsibilities, little or no project task level planning, poor follow-up on critical tasks and lack of professionalism. Good project management methods can be difficult to implement and measure; nonetheless, MIS managers cannot afford to ignore them as a means of enhancing productivity.

Establishing programming standards and verifying compliance can also contribute to more effective use of programming resources. The use of structured design and programming, walkthroughs and standardized documentation, for example, can produce dramatic benefits in programming productivity and quality.

An effective training program is crucial to implementing these ideas. An MIS department that is successful over the long term usually knows how to transfer management expertise and technical knowledge to less experienced staff. Such organizations recognize that systems professionals require formal training well beyond the entry level to lock in professional growth and transfer skills effectively.

Beyond the obvious personal benefit of acquiring skills, many programmers perceive their employer more favorably for having made the investment in their growth. A more dramatic short-term impact on productivity can be obtained by hiring

CALL FOR DETAILS ON: ON-SITE SEMINARS • VIDEO-BASED TRAINING • INTERACTIVE VIDEODISC TRAINING
To reserve your seminar space now or for additional information, call: (800) 323-UNIX or (312) 987-4084

Three factors make the Computer Technology Group the experts in UNIX and 'C' language training:

- Experience, through training thousands of students worldwide in live seminars, with thousands more using our video training at their locations.
- Extensive Curricula Supporting All UNIX Versions, creating a client base of manufacturers, software developers and end users.
- Quality of instruction, with instructors and course developers who are experts in teaching UNIX and 'C', as well as in designing and implementing a variety of UNIX-based systems.

The Leading Independent UNIX System
Training Company

OUR NEWEST SOFTWARE TOOK $20 MILLION TO DEVELOP, 5 YEARS TO WRITE AND WE'RE GIVING IT AWAY.

No, we're not crazy. And no, we're not joking.

We're Management Science America, Inc. The world's largest independent applications software company. And by Jan. 27th 1986, we plan to give 20 million dollars worth of our newest software to over two thousand of our customers. Instantly making it the industry standard for fourth generation technology.

Now, if you're particular about what you get for free, here are the particulars.

We call this technology Information Expert.™ Because it allows all your software systems to carry on intelligent conversations. With one another. In English. And thanks to our data dictionary, nothing will ever sound like Greek.

For end users, our system makes it easy to design reports. For your data processing staff, its fourth generation language makes it perfect for applications development.

It even allows borderless retrieval of information. So you get only the information you need.

Why are we giving all of this away? It's part of our customer support policy.

And if that doesn't sound familiar to you, you should become familiar with us. MSA.

MSA SOFTWARE

more experienced people.

Massive amounts of time, effort and capital have been expended on the development and use of fourth-generation, user-friendly programming languages. It is not clear that these languages are fine-tuned to the point where most programming requirements can be accomplished by end users without needing the assistance of trained systems professionals.

These languages, however, when used by non-MIS staff to develop low-volume or one-time programs, can increase development staff effectiveness by freeing them to work on more critical applications.

Motivation

Motivation is another factor affecting productivity. Herzberg developed the Motivation-Hygiene theory to explain employee satisfaction. Hygiene factors, which contribute to job dissatisfaction, involve company policy, supervision, work conditions and relationships with supervisors, peers and subordinates. Motivators, which contribute to job satisfaction, include achievement, recognition, the work itself, responsibility and growth.

Quite possibly, however, technical staff may be very different from other corporate personnel in the way they view their work.

A Columbia University study sponsored by *Business Week* magazine reports that "the innovative specialists who help companies develop and use their computer systems effectively often bring to their jobs different work standards, definition of status and criteria for success than those of most managers."

Technical people rated learning new skills, security, location and better hours as higher priorities than other corporate managers did. Technical people also rated such factors as responsibility, salary, autonomy and job title as less important than did other corporate managers.

A highly quantitative approach to assessing performance in all phases of systems development is a common denominator among successful development organizations.

In contrast, we have seen many cases where simple before-and-after analyses are not done, where "planned vs. actual" is not calculated and where "this year compared to last year" is not understood. Such organizations know nothing of performance variance, much less the causes of the variance.

It would be difficult at best to justify the installation of subsecond response time in an organization where systems development productivity was not measured precisely. Without measurement and the resultant detailed understanding of the performance, management cannot know the impact of its decisions.

In the absence of generally applicable data concerning the possible effects of implementing a subsecond response time program, a recommended course of action for an organization interested in increasing productivity is to conduct its own experiment.

Results, based on the organization's own personnel and environment, are far more credible and meaningful than external research results as that organization considers extending such facilities to all systems professionals.

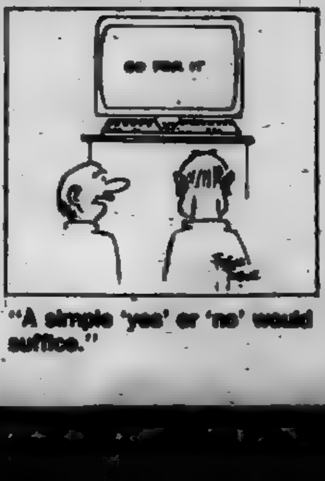
The ideal experiment should use function point measurement as well as "control" and experimental groups and measure individual programmer productivity rather than group totals.

About the authors

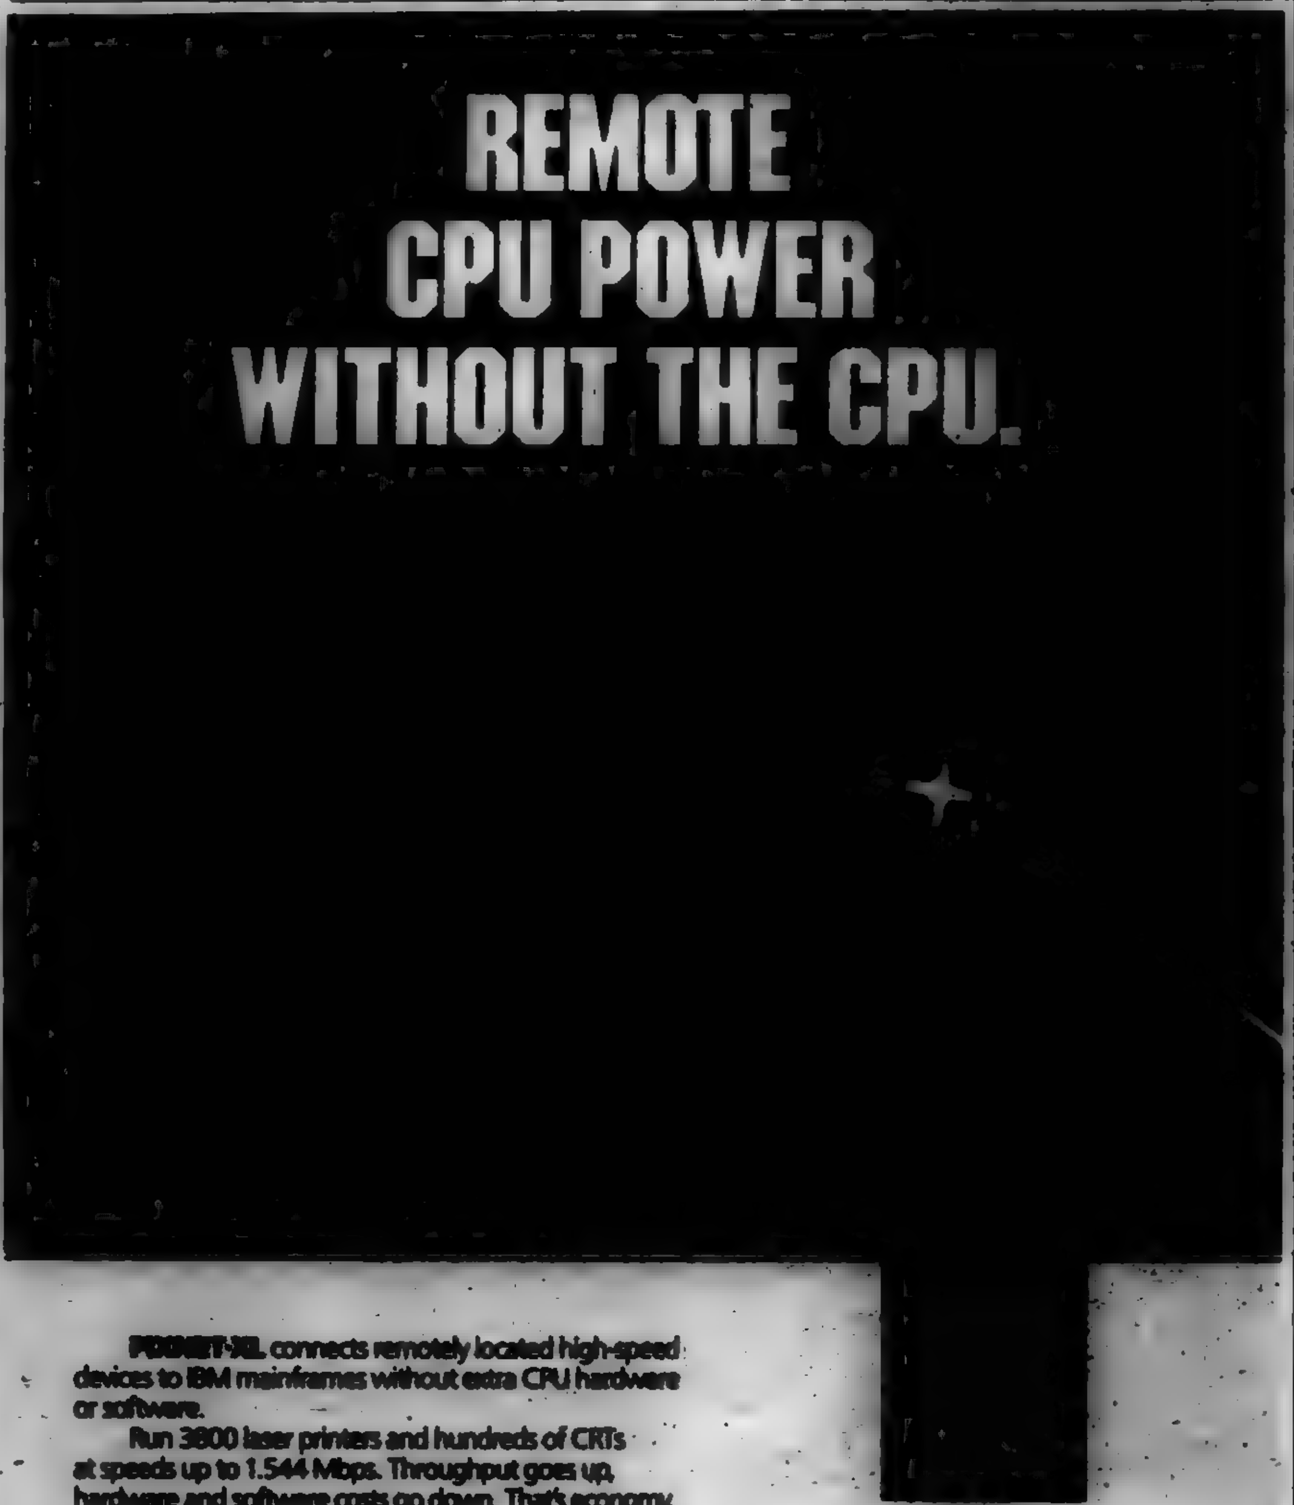
H. Thaine Lyman Jr. is a principal in the management consulting division of Touche Ross & Co. in Chicago and is the chairman of the company's large-scale systems task force.

James Anderson is a senior consultant in the management consulting division of Touche Ross.

Jeffrey Flowe is an associate consultant in Touche Ross' management consulting division.



"A simple 'yes' or 'no' would suffice."



PIXNET-XL connects remotely located high-speed devices to IBM mainframes without extra CPU hardware or software.

Run 3800 laser printers and hundreds of CRTs at speeds up to 1.544 Mbps. Throughput goes up, hardware and software costs go down. That's economy.

And to ensure ongoing network performance we cover everything from customer education to worldwide field service.

Cut the costs of remote processing with CPU speed and performance by PIXNET-XL. For information, write
PARADYNE CORPORATION,

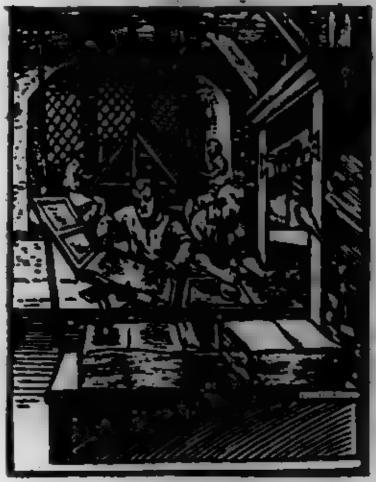
THE NEXT WAVE OF USER DOCUMENTATION



The next era of documentation will begin not because someone invents a better way to show a book on a screen, but because someone will decide it is time for the technology to adapt to the user instead of the reverse.

By Edmond Weiss

The traditional user manual is already obsolete.

When I make this statement to technical writers, I quickly reassure them that in data processing, many people work at obsolete tasks for years. (Consider all those folks still writing payroll programs in Cobol.) Some technical writers will keep laboring in their vintage 1960 reference-manual style for quite a while yet.

At the leading edge of documentation, however, profound changes are afoot. Like any futurist, I search for the future among the brightest practitioners of the present. What I see today is a second wave of interest in user documentation.

The first wave began in the late 1970s, with the proliferation of microcomputers into unaccustomed settings. The question then was, "How can we write manuals that users can understand?"

The second wave began more recently, probably impelled by the drop in the cost of memory. The question now is, "Why must productive use of technology depend on cumbersome documents or on any documents at all?"

In the early 1970s, when DP professionals were more worried about applications backlogs than the proliferation of user-written applications, documentation was little more than an administrative convenience. Before the advent of micros, the user or operator of a computer was likely to be a well-trained engineer, programmer or technician.

> ”
>
> *The typical manual users are not the willing victims that their ancestors were. In part, the typical users are no longer technically educated and many not educated at all; although they are literate, they hardly ever read.*

The users of yore expected their technical publications to be murky and difficult. Indeed, an inpenetrable manual was the cachet of the programmer's job, the emblem of technical challenge. Similarly, if the manuals failed because they were inaccurate, incomplete or obsolete, these resourceful users could be expected to immerse themselves in their undocumented problems and persist until the machine yielded its mysteries.

All that has changed with the personal computer. When the typical operator/user of a system is a business professional who won't waste time on inaccurate and indecipherable junk or an office worker who is proficient in administrative skills but a novice on a micro, the documentation must change.

Gradually, the developers of systems and products have become aware of a trade-off. They saw that good documentation saves money: Having good manuals costs less than not having them. Every incompleteness, every error, every unclear or obsolete instruction has its price. And that price almost always involves personal services: training, consulting, telephone hot lines, field visits or late-night trips to the operations center.

So, as the 1970s ended, there was a flourish of manual writing, including run books, which told operators what procedures to follow and look-up books full of definitions, policies and arguments. Written by people who learned their trade in the military and used a style that evolved during World War II, these user manuals were classics. They were definitive, comprehensive and yet compact. One or two large books would fit every user's needs. Anyone resourceful enough to explore the text would surely be rewarded.

Of course, some organizations still have not reached even this elementary level. There are still complicated systems without much user documentation. Sometimes this situation occurs because the user and operators are of that older ilk — uncomplaining and resourceful, able to get by with slim or incomplete manuals or with no manuals at all. More likely, though, this situation comes about because the costs of the personal services are not accounted for.

Some companies (and apparently many government agencies) are still unable to assess the cost of work performed by salaried employees. They act as though work done by the staff is free — as if the cost of the hot line is the cost of the telephone bill, not the people who staff it.

Almost as bad is the notion that the only costs that matter are those incurred in one's department. One manager told me that he saw no reason to lower the training expense by increasing his documentation expense because the training budget was someone else's department. In a perversely similar vein, another manager told me not to make the manuals too clear because the company sells its training to the customers to make an additional profit.

For most organizations, though, the 1970s brought the realization that systems without user manuals are wasteful. In response, the classic, one-size-fits-all technical tomes have been made available by most of the large vendors and better developers.

Resisting tradition

However, by the 1980s this classical orientation was proving unpopular and unworkable. Traditional manuals seem slow and cumbersome to people working on-line. Indeed, many workstations have no room for an open book much less two, as some vendors suggest.

In the '70s, users wanted manuals. In the early '80s, manual writers complain that users don't read the manuals they have. In part, this situation occurs because the typical 1980 manual is unsuitable for and inaccessible to any readers who value their time. Typical manual users are not the willing victims that their ancestors were. In part, the typical users are no longer technically educated, and many not educated at all;

The Picture Perfect Information Center
SYSTEM 2000® DBMS AND THE SAS® SYSTEM

The Picture Of Practicality.

SYSTEM 2000 DBMS is the only full-function DBMS for your Information Center. It's powerful enough for production work, has fully integrated features and offers built-in flexibility. It's simple enough for end-user needs, powerful enough for applications programmers, and sophisticated enough to offer the integrity and security data base administrators need. And it's so flexible every department can use it...every day.

Perfectly Powerful.

Now, you can enjoy Information Management that's truly powerful. SYSTEM 2000 DBMS and the SAS System...combined. Thanks to a new interface built directly into SAS software. Select SYSTEM 2000 DBMS data from within a SAS session...and use a full-screen menu to do it. Or, retrieve SYSTEM 2000 DBMS data from within a SAS session just by entering query commands. With SYSTEM 2000 DBMS and the SAS System working together, you'll increase productivity, reduce your applications backlog, and put a full range of data analysis, reporting, graphics, and programming tools to work for you.

SYSTEM 2000 DBMS and the SAS System. The perfect picture of success. To discover how it can work for you, call (919)467-8000, ext. 7004.

Please send more information about the SYSTEM 2000 DBMS and the SAS System to:

although they are literate, they hardly ever read.

Considered another way, though, the modern users' resistance to traditional manuals is understandable. Reading a set of instructions from a book makes little sense when the instructions could just as well be read on the screen of the system being used. With the possible exception of the installation procedure, all the information for users can be communicated through the system.

In the '80s, then, the issue is less information products (manuals) vs. personal services. Rather, the question becomes what mix of information products best serves a user community with its diverse needs and abilities. So we see the a small library of manuals, geared to these needs: comprehensive reference works; "friendly" orientation manuals; and quick reference brochures.

If there is a conflict, it is between books and "nonbooks." Today, many who market systems or manage data processing believe that manuals should be on-line or on audio tape or videodisk. In some cases, this preference is merely stylistic. In many cases, however, it reflects the understanding that printed manuals are often the least effective way to support systems and software.

> ”
>
> *The enlightened view is that user manuals are part of a library of documents that are part of a library of book and nonbook information that is part of a set of goods and services that support the user.*

Putting manuals into a data base (as opposed to merely shipping them on diskettes, another common practice) is more than a gimmick. Reducing the need for operators or users to leave their work in search of a printed table is simply good procedure. Jumping from screen to book to reference card to screen to book again irritates and inconveniences the user. More importantly, it causes errors and lowers productivity.

The people who benefit most from on-line user documentation are those with limited book skills; not limited reading skills — book skills. A large number of the people who are presumed to be poor readers are really only poor finders. Their problem is less with sentences and paragraphs than with indexes. If they could find what they need, they could read and understand it.

For these readers, the alternatives are either carefully written books that remove all extraneous and distracting material or on-line documents that find the material without much work by the reader.

In this second category, the two most prominent examples are the interactive tutorial and the context-sensitive Help screen. The former is an on-line realization of that most powerful of teaching tools, the branching programmed text, in which you must give the right answer before you may see the next increment of instruction.

Interactive tutorials give all the benefits of programmed texts without their central problem: the need to skip, branch, loop and detour. In a well-made tutorial (built with computer-based training (CBT), or "authoring," tools), the reader cannot misunderstand and, more importantly, cannot get lost.

Context-sensitive help is a utility in which the user asks for help (typically with one key), and the system finds the page in the manual that the user needs to see. Interestingly, the text files that underlie the Help facility are probably the classic user manual, indexed and partitioned so that each section corresponds to a particular task. And the next stage, no doubt, will give us "anticipatory" help, in which the system observes that the operator is having trouble (delays, errors and so on) and offers help before it is requested.

Moreover, getting documenters to write for the screen imposes a useful discipline on them. On-line documents must be organized into small, compact chunks; as hard as it is to use two pages at once in a manual, it is that much harder to see two pages at once on a screen. (Windows do little to solve this problem, but there are some emerging display devices that promise to show us several full-sized screens at once.) And the limited number of characters on the screen exacts an economy of expression that demands more editing than usual. That's why the most common flaw in on-line messages is that they are too compressed to be understood. The second most common flaw is the lack of procedural diagrams.

Support

What matters most now is support — the merging of documentation, quality control, training, implementation and customer service into one enterprise. The enlightened view is that user manuals are part of a library of documents that are part of a library of book and nonbook information products that are part of a set of goods and services that support the user.

Personal services involve little start-up cost. But they persist forever and usually increase as the number of users grows. Further, contrary to what many people expect, the better users get with their systems, the more support they want.

These expensive personal services

FUTURE-CALC
THE WORLD'S MOST POWERFUL SPREADSHEET

SOFTWARE	• Runs on IBM Mainframes under CICS and TSO
SPEED	• Runs up to 100 Times Faster Than Other Mainframe Spreadsheets
FILE ACCESS	• Interactively accesses and updates existing files and data bases — Performs automatic data conversions • Can access data from your existing accounting files
3-DIMENSIONAL MODELING	• Provides fully modular, 3-dimensional modeling • Spreadsheet models can contain up to 256 sheets • Any sheet can have up to 5500 rows or 256 columns • Simultaneous system-wide sharing of spreadsheets, models and formulas • Any sheet can be used simultaneously in many models • Any set of formulas can be used with any sheet
CONSOLIDATION	• Consolidate up to 256 sheets into a summary with one command • Consolidate unlike sheets
USER DEFINED FORMULAS	• Users can define their own functions and procedures which are available system wide
POWERFUL FEATURES	• Many spreadsheets can be "PAINTED" without entering formulas • Cells, rows and columns can be addressed using meaningful names such as SALES, COSTS, TOTALS • Many different table lookups including 3-dimensional lookup • Sort simultaneously on any number of keys • Perform arithmetic using calendar dates • Exclude or hold any row or column • Dynamically assign formats and attributes under procedural control • Provides data entry and ad-hoc query capabilities
SECURITY	• Control Security at the spreadsheet, user or file level • Security is easily implemented even for classes of users
ONLINE HELP	• Comprehensive explanation of commands and error messages • Text Editor provided to allow user-defined documentation
MARKETING	• FUTURE-CALC is being purchased by many companies who previously acquired other mainframe spreadsheet software because FUTURE-CALC: • Runs much faster and uses 80% less file space • Is easier to use and has much more power • Provides a much better method for file access
FREE TRIAL	• For a free 30-day trial or a brochure, contact Future Software

> **"** *The latest issue in user documentation is a skepticism about the notion of support itself. The first step was to provide information; the second was to give support; the third is to ask why all this support is necessary.*

that are often the unintended consequence of inadequate documentation may also be viewed as a deliberate support strategy. Enlightened documenters may choose between goods and services, between books and nonbooks.

One firm can aspire to "customer independence" through an ambitious set of books, disks and tapes, while another brags about its personal service and unlimited consulting. One organization can seek to create manuals that will clearly solve any problems an operator might have; another might skip the manuals and add more supervisors.

Trade-offs between goods and services and between books and nonbooks often reduce themselves to the issue of short-term vs. long-term support costs. Good manuals, adapted for their users, are expensive to write, but they justify themselves later in productivity, good will and the reduced need for personal services.

The latest issue in user documentation — a harbinger of things to come — is a skepticism about the notion of support itself. The first step was to provide information; the second was to give support; the third is to ask why all this support is necessary.

Support, it turns out, is a euphemism for helping users adapt to the difficult aspects of their systems. Although terms such as "user interface" suggest that users merely plug themselves into the system, in fact, such ease is hardly the case.

Support is the name for all the activities that bridge the gap between the wishes and abilities of the user on the one hand and the capabilities and dispositions of the system on the other. Support compensates, underpins, retrofits, translates, spackles, patches and reinforces.

In a way, support gives prostheses that help the users overcome their handicaps. And the better we get at support technology, the more useful and ingenious the appliances we invent.

The next wave

Support is what helps the users adapt to the system, not vice versa. In effect, technical writers explain the ways of machine to man, not the other way around. Training programs teach users to act the way the machines want them to act, not the reverse. It is this principle that inspires the next wave of documentation.

If the user is viewed as one of the components in a system, then the very need for support may be viewed as evidence of a bad interface among the components. There is a bad fit between users and hardware — as, for example, when there is no way to tell whether a toggle switch is on or off. Or there is a bad fit between users and software — as when the same program uses different Enter keys at different times or when a commonly used word processing command requires what pianists call an "octave spread" between one's fingers.

What nearly every manual writer discovers early on is that clean, clear procedures need less written explanation than complicated, clumsy ones. Similarly, a procedure or concept that resists explanation probably resists proper use.

What the latest teams of documenters also realize is that this clumsiness that seems to cry out for heroic manual writing is much more than the inevitable consequence of advancing technology: It is evidence of poor engineering. Specifically, it means that the system or product is unreliable.

Reliability will be in the late 1980s what maintainability became in the late

Seminar Agenda

8:30 – 9:00 am Registration
9:00 – Noon "An Introduction to Logic Programming and Knowledge Based Expert Systems"
Using simple case studies, we'll demonstrate some of the many lucrative applications of Logic Programming. Learn about MPROLOG, a portable, user-friendly version of the language endorsed by Japan's 5th Generation Computer Project and many multi-national corporations to bring Expert Systems on-line. You will also discover how MPROLOG can be utilized to implement Explanation Systems, Natural Language applications and Rapid Prototyping through Logic Programming. The seminar will conclude with suggested strategies for getting on the road to dramatic increases in performance and productivity.

YES, I want the edge in Software Development!

☐ Please register my name for this no-obligation seminar.
☐ I cannot attend, but please forward more information about MPROLOG.

This is no way to manage a network.

It takes more than wishful thinking to keep a network up and running. Particularly if you're working with more than one vendor and coordinating resources in many locations. Just by adding users, small problems can turn into big ones and, before you know it, your network's down from here to Hong Kong.

Not to worry. Now, there's the new Codex 4800 Series Network Management System. It monitors your network and detects and helps correct potential problems before they foul up your operation.

There's more. The Codex 4800 Series can generate reports for tracking, analysis, and forecasting...all of which you need for making the right decisions at every organizational level.

The Codex 4800 Series Network Management System is so fast and so smart, you can spot potential problems and react much more quickly to changes in the environment. And, since it's totally independent of your mainframe, you get status information without affecting ongoing operations.

The system works with the industry's most-preferred networking modems from Codex, and includes a raft of other features to make your network more effective. You have greater operational control, improve your cost efficiency, and ensure optimum network uptime.

Whether your network is large or small, Codex has the network management system that will meet your needs and grow right along with your business.

So uncross your fingers and reach for the phone. Call **1-800-426-1212, Ext. 281**, for more information on the new Codex 4800 Series Network Management System. Or write Codex Corporation,
Dept. 707-281,
20 Cabot Boulevard,
Mansfield, MA
02048.

for Your Information Center

[illegible]

1970s — the main criterion of system quality and cost-effectiveness. And the last frontier of computer system reliability will be the user, the least well understood or controlled element in the process.

Shift in support

Instead of developing ever more friendly manuals, the goal will be to shift the nature of support from external goods and services to internal design features. (Perhaps "internal support" is a contradiction in terms.) The reliability of the system in use will derive less from slick manuals than from the following factors:

- Intelligibility — the ease with which prompts and messages can be read, understood and, where appropriate, obeyed.
- Invisibility — the degree to which users are unaware of the system's tasks and peculiarities (what programmers misleadingly call "transparency," a word that means obviousness) and are free instead to think and communicate in their own terms.
- Insight — the ability of the system to anitcipate what the user wants and interpret the user's "errors."

To an extent, putting reference material and procedures on-line is a rudimentary form of internal support. But a more dramatic move in this direction would be eliminating even the need for on-line pages.

From this perspective, preparing a readable booklet of error messages is the first step; putting this directory of error messages on-line is the next; making the error messages themselves intelligible is the next; eliminating the situation that caused error is the last.

In the fourth and fifth generation, then, documentation converges on design. Users stop asking how well-documented the system is and start questioning why the system needs so much documentation. Similarly, users may stop purchasing the products with the best support and service and instead choose the ones that do not require much support or service.

Writers as designers

When documenters are included on the design team, they tend to become designers. In the most advanced development groups, it is difficult to tell the writers from the programmers. Indeed, since today's technical writers work with computers using a variety of software tools, they can be considered programmers.

Those organizations that still want one-size-fits-all, comprehensive reference manuals should be looking for traditional technical writers, primarily those with backgrounds in aerospace or electronics. In those organizations with a variety of users and customers, especially places where the term "user-friendly" is uttered often, the best documenter might be thought of as a support engineer. This person is not only a skilled writer but also a skillful teacher and consultant.

> *Reliability will be, in the late 1980s, the main criterion of system quality. And the last frontier of computer system reliability will be the user, the least well understood or controlled element in the process.*

More importantly, the support engineer is someone who believes that the burden of effective communication and implementation is on the developer, not the user.

Support engineers

Support engineers can come from any background. Like the programmers of the early 1960s, support engineers didn't learn their trade in school. They are drawn by aptitude, opportunity, even passion. And their challenge is the most interesting assignment in all of data processing: to bridge the gap between developers and users, between engineering and sales.

Support engineers must possess superior writing and communications skills, no matter what they studied in school. Beyond that, they must be able to understand

is the "Old Fashioned" way.

"So you think Infinet's remote dial back-up capability is great. Well, guess whose idea it was."

LA Nelson

Lynn Nelson
Network Operations Manager
Contel Network, Inc.

The data communications people at Contel feel they deserve some credit for our new EMS-II Network Control System.

And, quite frankly, they do.

At Infinet, it's our policy to work closely with our customers to develop the kind of network capabilities that best meet their needs. We think it's a good policy. And our new EMS-II is a good example of how well it works.

We spoke with Contel while we were developing the EMS-II. We wanted to know what they needed most in a network control system.

Contel operates one of the largest multipurpose X.25 networks in the world, a network that is vital to Contel's $4 billion business.

Because they can't afford to wait until a line problem is fixed, Contel asked for one thing more than any other: an automatic dial back-up capability to maintain communications between hub and remote sites—no matter what happens to a line.

At Infinet, we know a good idea when we hear it, so we developed this feature for our EMS-II Network Control System.

It works so well, Contel's users are often not even aware when they're on dial back-up.

And network restoral isn't all the EMS-II can do.

It lets you monitor, test and reconfigure your entire network. Digital or analog. From one central site. Plus it can be integrated with network management and performance measurement into a single data base.

So, if you want to thank someone for the EMS-II's extensive network control capabilities, thank Contel, too.

For more information on our EMS-II or on any of our other network management products, call Infinet toll-free at 800-343-[illegible]. (In Massachusetts call toll-free 800-322-1238.) Ask for extension 5200.

what users and systems do and to referee heated arguments between business professionals and software wunderkind.

The best ones also have the knack of suddenly becoming blissfully naive about computers when it comes time to explain a procedure to a neophyte user.

Separate but united

Inevitably, there is some specialization among support engineers. Those who support managers and executives are often trained in management science and technology (financial analysis, operations research and so on), while those who work with clerks and neophytes tend to be from instructional technology or CBT.

Whatever their specialties and job titles, though, support engineers are united by their loyalty to the best interest of the users and customers and by a sense that, given the right mix of information products and services, a system can be operated effectively.

The next few years will be a time in which support technology improves dramatically. New storage and video hardware will make on-line manuals even more attractive and readable. There will be new ways to look things up, several of them involving lasers.

The skills of the manual writer will evolve into the skills of the information support specialist. Already, public seminars on user documentation include sections on how to write Help screens and interactive tutorials.

Internal support

The next issue in documentation is internal support. A procedure that needs external support is less reliable than one that does not. Thus, whenever there is a choice between supporting a procedure with a clever document or changing the procedure so that it does not need support, the wise technical writer will recommend the latter.

The best news about the future is that everything the support engineers are learning about user needs and proclivities — what they incorporate into usable manuals and Help screens — will be directly useful in the future.

In the fifth generation, systems will be expected to deal with the users, a skill that many systems analysts haven't learned yet. Today's technical writers will be teaching systems how to adapt to their users, a subject on which the writers are the undisputed experts.

Eventually, though, the next era will begin — not because someone invents a more spectacular way to show a book on a screen, but because someone will decide it is time for the technology to adapt to the user instead of the reverse.

About the author

SCIENCE/SCOPE

A new generation of powerful, ultrafast semiconductor microchips can soon be produced at rates required for commercial manufacturing, using the world's most sophisticated electron beam lithography system. The system is capable of writing circuit patterns with features as small as 0.5 micrometers — about 1/200th the diameter of a human hair. It was accepted recently by the U.S. Department of Defense for its VHSIC (very high speed integrated circuit) program. The acceptance culminates four years of development by Hughes Research Laboratories and Perkin Elmer Corporation leading to the direct-write system.

Controller-thrust aircraft engines will be tested at NASA's Lewis Research Center with three heat monitors. Three Probeye™ thermal video systems will monitor, measure, and analyze heat from the engines while they are operated within the environmental test chamber at the research center. Each Probeye system consists of an infrared imager, image processor, and TV display, all of which interface with a computer. Hughes designed and produces the Probeye system.

A prototype Amraam missile passed within lethal distance of a target aircraft in the first guided launch of its full-scale development program. The unarmed weapon was launched from a U.S. Air Force F-16 flying at Mach 0.85 at an altitude of 21,000 feet. It was fired from behind a QF-100 drone flying at Mach 0.7 at 21,800 feet over White Sands Missile Range in New Mexico. Telemetry data indicate the 12-foot-long, 335-pound missile met all test objectives. The flight also verified Amraam's interface with the F-16's avionics system and the performance of its active radar guidance capabilities. Hughes is developing the AIM-120A advanced medium-range air-to-air missile and its companion rail launcher for the U.S. Air Force and Navy.

A new 6x9-inch minicomputer executes one million instructions per second for a U.S. Navy communications terminal. The small rugged computer, developed by Hughes and designated the HMP-3220, is part of the Joint Tactical Information Distribution System (JTIDS) terminal. It executes standard Navy software written in the CMS-2 high order language. The computer uses a combination of advanced CMOS configurable gate array and advanced Schottky integrated circuitry packaged in digital hybrid technology. This advanced design and packaging concept enables two central processors (each with a 96K word ultraviolet erasable memory, 32K words of CMOS static random access memory, and a common data bus input/output interface) to be contained on a single, pluggable circuit card assembly. Total power consumption is less than 120 watts. JTIDS is a secure communications network used to link U.S. armed forces. JTIDS uses several computer-assisted techniques to transmit data while preventing enemy jamming and interception.

Hughes needs engineers, scientists, and programmers to forge new frontiers in aerospace radars, weapon control systems and avionics, airborne displays, aerovehicle data links, and airborne countermeasures. Current openings are for people experienced in design, development, test and manufacture for systems engineering, project/program management, design of circuits and mechanisms, and bringing these to reality through the application of advanced manufacturing techniques. Send your resume to Hughes Radar Systems Group, Engineering Employment, Dept. S3, P.O. Box 92426, Los Angeles, CA 90009. Equal opportunity employer. U.S. citizenship required.

IN DEPTH

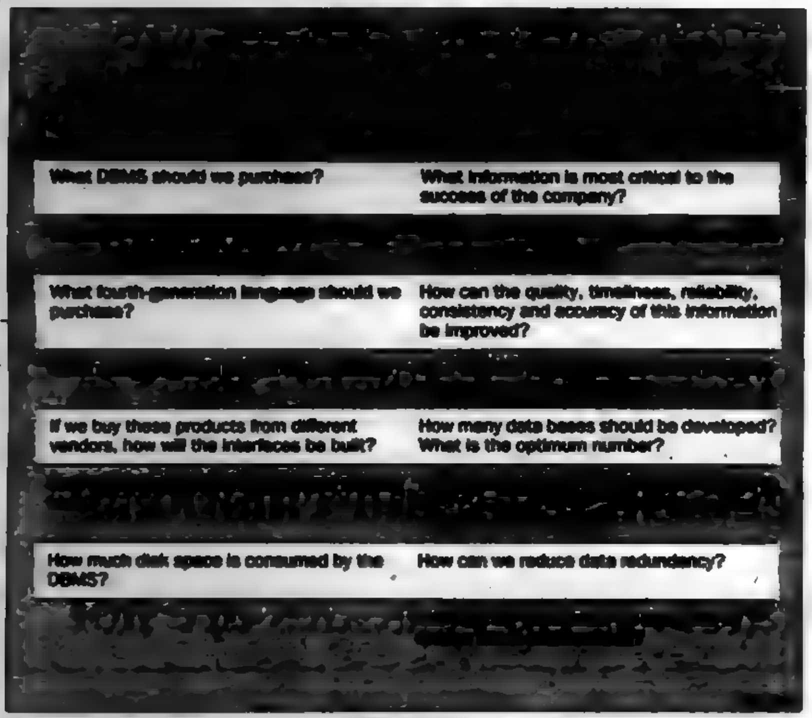
Although the technical challenges of implementing data administration are formidable, they are relatively small in comparison to the political, organizational and emotional issues facing the data administrator. If these issues are not understood or are ignored by an organization prior to instituting a data administrator function, the long-term success of data administration could be jeopardized.

The Politics of Data

By William Durell

The first challenge that data administration faces is a general lack of understanding of its purpose and nature. Many organizations perceive data administration in a purely technical light. If you ask the average data processing professional for a definition, the answer would probably express the technical aspects of a data dictionary or data base management system. Although these are two tools used by the data administrator, they are merely a means to an end and are certainly not the objective of data administration.

The objective is not to install and implement data base management systems and data dictionaries, but to use these as tools to achieve the management and control of information within the entire enterprise. Data administration is as much a managerial function as a technical one. Therefore, the data administrator must advertise and



What DBMS should we purchase?	What information is most critical to the success of the company?
What fourth-generation language should we purchase?	How can the quality, timeliness, reliability, consistency and accuracy of this information be improved?
If we buy these products from different vendors, how will the interfaces be built?	How many data bases should be developed? What is the optimum number?
How much disk space is consumed by the DBMS?	How can we reduce data redundancy?

Figure 1

emphasize the global data management aspects of his job to overcome the preconceived notion that it is technical in nature.

An organization tends to spend large amounts of time and money analyzing the advantages and disadvantages of various commercially available data administration software and hardware products, yet it ignores those data management problems that are nontechnical in nature.

For example, it is not unusual for a large organization to spend 12 to 24 person-months evaluating and selecting a DBMS. An equivalent amount of time is often devoted to the evaluation and procurement of a data dictionary system.

Yet most organizations are reluctant to spend even a fraction of these resources to analyze the nontechnical problems of information management. This analysis must include business systems planning and entity analysis activities.

Figure 1 illustrates the typical overemphasis on technical solutions and underemphasis on nontechnical problem solving.

Planning and control

The benefit of automated tools such as DBMS and data dictionaries can only be realized through proper planning, control and use of the tools. For example, many new users of data dictionaries haphazardly populate their tools with information from existing applications. Little thought is given to the benefits or costs of this approach or to how this information will be maintained once it is put into the dictionary.

Likewise, many new DBMS users load the DBMS with data stored in existing files. The only thing that has changed is the data access methods involved. Often nothing is done to improve the quality of the data or to reduce data redundancy.

Most problems of data redundancy and inconsistency cannot be blamed on the lack of quality data tools. Many cannot be solved with technical approaches because they are organizational, political and managerial in origin. To expect hardware or software tools to solve these problems is to use the tools as a scapegoat for the more basic, nontechnical problems.

While it is important that a company answer the technical questions related to information management problems, an enterprise must also address the following nontechnical issues:

- Does the existing organizational structure of the DP staff encourage the proliferation of redundant data to support different application systems? For example, do the payroll system and the personnel system each have their own data bases of redundant employee information? Do the purchase order system and the merchandising system use separate data bases that contain redundant customer information?
- What changes could be made to the DP organization to reduce data redundancy over the long term?
- What changes can be made to improve the communications and coordination necessary so common data can be shared among different application development groups?
- Do the existing end-user departments dictate the creation of overlapping DP systems and thus foster data redundancy? How can the lines of communication among end-user departments be improved to help reduce this problem?
- What can be done to pursuade end-user organizations to share funding for the development of common data, increasing the amount of common data used?
- How can the DP and end-user organizations better understand the commonality or similarity of information resources?

Data administration is at a disadvantage politically within the company because neither its goals nor its accomplishments can be measured by the traditional means used to evaluate other members of data processing. Data processing personnel traditionally have been measured by quantitative means, such as project budgets, elapsed time to develop a system, number of programs written, number of lines of code completed, number of terminals installed, number of manual processes automated and reduction in clerical work force.

The success of DP is often gauged according to its utilization and optimization of hardware and software

"At last! An SPF-Like editor under CICS!"

SYSD® offers full functionality

"My idea was to find a 10MB disk small enough to fit in my pocket."

Our IDEAdisk 10+10 gives him that and a growth path up to 120MB.

Are you paying a premium for a hard disk that's based on the technology of a floppy? You don't have to. You get speed, reliability, proven Winchester technology, and a smaller footprint with IDEAdisk 10+10. Our cartridge is about one quarter the size of the Bernoulli cartridge. So it easily fits into your briefcase—or your pocket—and leaves room to spare.

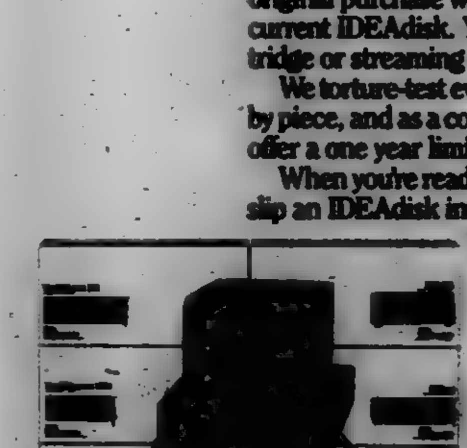
But size isn't the only thing our IDEAdisk has going for it. You get the convenience and security of a 10MB removable database with the speed and accuracy of rigid, plated media.

Best of all, the IDEAdisk 10+10 is your gateway to unlimited growth with the IDEAdisk family. Our footprint may be smaller but our storage ideas are bigger—all the way to 120MB.

IDEA's unique upgrade policy gives you credit for your original purchase when your storage needs outgrow your current IDEAdisk. You can even choose between disk cartridge or streaming tape cartridge backup.

We torture-test every IDEAdisk before it's shipped—piece by piece, and as a complete subsystem. That means we can offer a one year limited warranty, rather than just 90 days.

When you're ready for a smaller idea in hard disk storage slip an IDEAdisk into your pocket.



Contact your local dealer to start on the growth path with IDEAdisk 10+10. Or call IDEA at 800-257-5027.

> ***The success of an applications development group can be measured in terms of elapsed time and cost . . . The success of data administration, on the other hand, should be measured in terms of long-term reduction of overall data redundancy and improved quality of information.***

resources. Efficiency of operations may be measured simply in terms of CPU cycles and disk space consumed, response time and throughput from data entry to output.

Data administrators, to their chagrin, are sometimes judged by these same standards. Data administration must not be judged in terms of volume of metadata. How does one measure the reduction in redundancy or the improvement of the consistency of data that has been achieved by data administration? It would be ludicrous to measure a data administrator by the number of data elements loaded into a data dictionary or the number of data bases that have been implemented.

On the contrary, an inverse relationship exists between the quality of information and the quantity of data. For example, the data administrator employs information modeling techniques to reduce the number of data bases developed and at the same time increase data sharing.

A significant problem for data administration is the lack of tools or techniques to measure the quality of information. Quantity is much easier to measure than quality.

Another difference between the evaluation of DP and data administration staff members is the length of the evaluation period required. The goals and objectives of DP tend to be short-term and local in nature, data administration long-term and global.

The success of an applications development group can be measured in terms of elapsed time and cost to implement a single application system. The success of data administration, on the other hand, should be measured in terms of long-term reduction of overall data redundancy and improved quality of information throughout a company.

Thus, the evaluation period required to assess accurately the success of the data administrator is longer than that of a member of the applications development staff.

A trendy issue

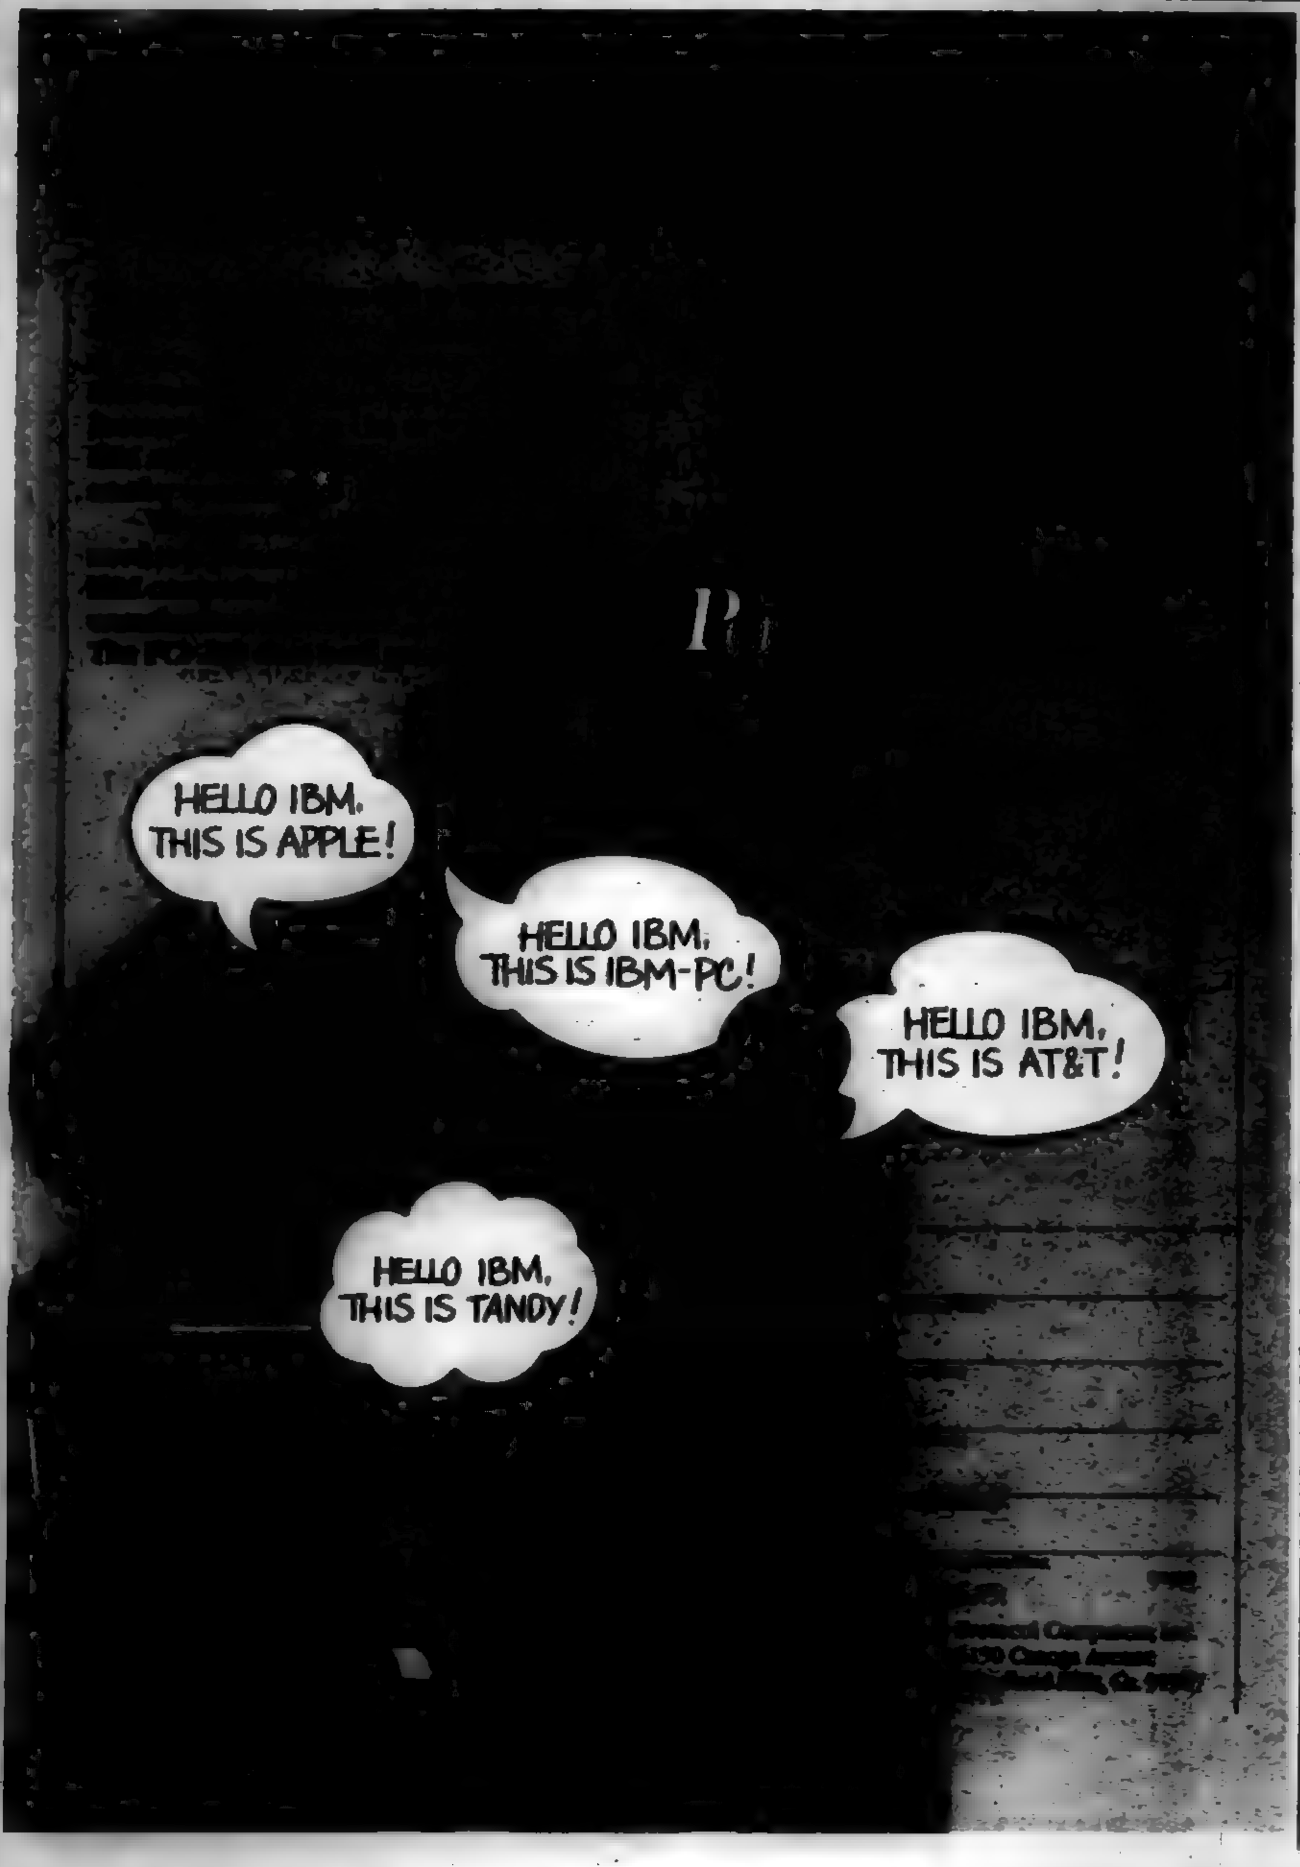
Many organizations implement data administration without sound motives for doing so. This reflects a lack of understanding of the nature, purpose and benefit of information management.

Some organizations are motivated to create a data administration function out of fear of falling behind the competition if they fail to do so. Others feel compelled to establish data administration because they perceive that it is the trend of the DP industry. Their curiosity about data administration is aroused by seeing articles on data administration in DP trade publications or hearing about it by word of mouth.

Still others are introduced to the concept of data administration by data dictionary or DBMS salespersons. Only after a data dictionary is purchased does someone ask, "What are we going to do with this?"

Thinking that they have purchased the tool and must now rapidly populate it so they can demonstrate some return on investment, these managers next ask, "What person or organization will be responsible for its maintenance?" This leads to the creation of data administration for the wrong reasons.

The proper approach would be to analyze and understand the cost of data administration, how it can improve the quality and value of a business' information and how this improved information can make the business more competitive. Unless an organization understands the real value of data administration, this



HELLO IBM.
THIS IS APPLE!
HELLO IBM,
THIS IS IBM-PC!
HELLO IBM,
THIS IS AT&T!
HELLO IBM,
THIS IS TANDY!

resource management function will merely exist, and never become a viable and beneficial part of the enterprise.

Methodology and creativity

The objective of data administration is to make the collection and use of information more uniform and consistent. The human being is a creative and imaginative creature and does not always enjoy performing the same tasks in the same manner, but consistency and standardization in data are crucial. Somehow the data administrator must combine intuitive or creative instincts in data design with a scientific, rigorous, methodical approach to data management.

The techniques used in entity-relationship-attribute modeling and logical data base design, for example are based on sound and precise mathematical principles. The successful implementation of data administration requires a significant change in the approach to data design and an overall shift in its emphasis from artistic to scientific.

We live in a prescription-oriented society. When we have a headache, we take an aspirin. When we have a stomach ache, we take an antacid. We search for "fast, fast, fast relief." Management also often looks to technical solutions as quick fixes for its data management problems.

However, as discussed earlier, many of these problems are not technical in nature. Many problems of inadequate information are related to problems of organization, lack of planning, lack of proper management, coordination and communication. And unlike technical problems, they cannot be solved quickly.

Many solutions of data management problems require changes in methodology, not technology. However, changes in technology can often be achieved faster than changes in methodology.

Changes in software or hardware can often be achieved faster than changes in the way people perform their jobs. Changing the manner in which a human being works requires selling and marketing efforts, creating a perceived need, communication, friendship and persuasion. These efforts often require several iterations and years to effect.

Challenging precepts

Traditional process-oriented design does not take into consideration the need for overall coordination and planning of data across application boundaries; rather, it concentrates on integration of local data within single application systems. The data administration professional understands that global planning of information must precede local data base development.

Data administration concepts advocate changing the sequence of events in traditional system development to shift the emphasis from process orientation to data orientation. The focal point of DP should be an integrated information model, and application systems should be developed on the periphery of this model. However, traditional process-oriented design dictates that peripheral interface data is necessary to integrate centralized hubs of applications. Thus, data administration challenges the basic process-oriented approach that has been employed during the last 20 years. This can be disconcerting and sometimes insulting to many long-time DP professionals.

The solutions to data administration problems advocated by the data administrator first require the identification of the data management problem itself. The worst problem is the one that goes unrecognized. Most DP organizations do not perceive the existence of data integrity problems. Many organizations have lived in a situation of data incompatibility and inconsistency for so long that, to many, this is a normal situation.

Some of these professionals may ask why there is a need for data management solutions when no problem currently exists. Because data administration discovers and advertises the existence of data integrity problems, it is accused of creating blemishes on the record of DP, when in fact it is only illuminating them.

Figure 2

Effective data administration requires several changes in the traditional responsibilities of data design and management. First, data administration employs a logical data analysis and a design specialist (the data analyst), which necessitates that the systems analyst and/or data base analyst relinquish this responsibility. Second, data administration advocates a shift in certain data design responsibilities — data element definitions, logical data base design and entity modeling — from DP to end user.

Traditionally, some data analysis and logical design tasks were performed within the data base administration or system development departments. Unfortunately, these data-related tasks were often performed on a part-time basis and were not given the necessary priority. The data administration seeks to concentrate these efforts into one organization.

Data administration advocates a vertical monopoly of personnel (*Figure 2*) that specialize in the entire

informatics general corporation.

application development report: MARK V

HARRISBURG MARATHON PROVIDES TRIAL RUN FOR MARK IV® AND MARK V® SOFTWARE

Within two hours after the last runner had crossed the finish line at the Harrisburg Marathon, Pennsylvania Blue Shield, chief sponsor of the annual event, had completed a computer-generated report on the run times and standings of the Marathon's 900 entrants and delivered it to the news media.

This was in sharp contrast to the previous year when it took approximately three days to get the Marathon results to the media. The greater responsiveness this year was largely the result of moving the Marathon application from an in-house Prime computer to Blue Shield's IBM 3081 system running in an IMS environment. The reprogramming of the Harrisburg Marathon application, completed in record time, was Blue Shield's initial test project for MARK V and MARK IV, Application Development Systems from Informatics General Corporation for generating online and batch applications respectively.

"We wanted to get acquainted with MARK V on a relatively simple and straightforward application like the Marathon before we began our full-scale pilot project, a new online claims processing system," Thomas M. Cline, Systems Development Supervisor, explained.

Programming the Marathon application consisted basically of creating and maintaining an online Entrant File including four screens to (1) maintain basic entrant information (name, address, phone number, and a "TAC" number to be used for Olympic identification in case the runner qualifies for the U.S. Olympics); (2) maintain control information (payment of fees, lunch and dinner reservations, etc.); (3) record the run time of each of the approximately 900 entrants; and (4) provide a menu for accessing the other three screens.

To produce reports in addition to the online portion of the Harrisburg Marathon application, Blue Shield used another Informatics Implementation System, MARK IV, to produce the required batch reports. A productivity tool designed for generation of batch applications, MARK IV also had its "trial run" for Blue Shield with the Marathon application.

Approximately 12 different reports were produced for the Marathon, including check-in sheets for use on the day of the race (cross-referencing the runners alphabetically and by runner number), three sets of mailing labels, and several types of reports listing the finishers by time, sex, and class of the runner. The reports on finishers were prepared for the news media, for internal use, and for the Athletic Congress listing any runners who qualified for the U.S. Olympics.

1983 was the eleventh year that the Harrisburg Marathon has been run. Unlike the famous Boston Marathon, which requires that entrants meet qualification standards, anyone can enter the Harrisburg event. The grueling course — 26 miles and 385 yards in length — begins near the Pennsylvania State Capitol building and winds through the streets of Harrisburg and the surrounding countryside.

Each year, large numbers of Pennsylvania Blue Shield employees volunteer their time to help with the race. "Probably 30 percent of our DP staff were involved in some kind of volunteer work for the Marathon," said Hugh Gallagher, also a Systems Development Supervisor, who coordinated the record-keeping for the Marathon. "This included registering entrants, manning water stations, keeping track of times, all sorts of things. For example, our Director of Systems Development, Karl Mundis, was in charge of one of the water stations, and I was in charge of the finish line."

Everything about the Marathon was done on a volunteer basis — including the programming for the new online Entrant File application, which was done primarily in evenings, lunch hours, and weekends, with Tom Cline doing most of the programming himself in MARK V and MARK IV.

"Our time for preparing this was so short that some of the software had never been tested prior to the day of the race," Gallagher recalled. "Fortunately, it worked like a charm".

"One of the things I found in implementing the Harrisburg Marathon application was that you don't need a lot of in-depth knowledge of IMS to use MARK V in a straightforward application like this, where you're just going in against a data base to update and add segments," Cline noted.

"I found that MARK IV and MARK V complemented each other very well," Cline added. "I found that with MARK IV, once I had established a set of reports, it was very easy to go back in and change a report, or set one up with a different set of selection criteria. I found I could make a change to a report in minutes. If I'd been working with COBOL, as I have in the past, this would not have been a matter of minutes."

"So far, we've only just gotton our feet wet with MARK IV and MARK V," Cline concluded. "But it looks quite promising in terms of potential productivity increases. I'm particularly impressed by the flexibility I've seen in setting up our initial application — the ability to make changes in a very short period of time."

I would like to see how the MARK Series can help me with my CICS, IMS/DC and batch programming.

spectrum of information management, from initial planning to final design. These specialists administer and manage information from the global, information modeling level to the local, application design level. Thus, the data administrator seeks to create a "data organization" parallel to the traditional system or application development organization.

Administration vs. processing

In many ways, the methods and objectives of data administration are in direct contrast to those of DP. These contrasts include methodology, organization, responsibility and philosophy.

First of all, the data-driven data administration approach is quite distinct from the traditional process-oriented DP approach to systems development. Data administration advocates a centralized hub of information (the information model) surrounded by a periphery of application systems. (Figure 3). The traditional DP approach directs the creation of single-purpose data bases built in support of single-application data processing systems. (Figure 4, ID/31).

Significant differences in the timing, sequence and importance of tasks exist between the process-oriented and the data-oriented system development scenarios. The traditional DP approach dictates that data be subordinate or subservient to application-oriented systems.

The data administrator handles application programs and systems as the input and output procedures for a centralized data base. The administrator recommends the analysis of the information requirements in parallel with or prior to the analysis of the process (function or service) requirements.

Structure

Many DP organizations are established and structured to support application-oriented programming staffs that in turn support single end-user departments. Different project leaders are often designated to support individual human-resource applications such as payroll, personnel and benefits systems. These systems are built to service single end-user organizations such as the payroll, personnel and benefits departments, respectively.

However, the data administration organization is structured around the management and control of each subject-oriented subset of the global information model, such as all employee-related data. This leads to the concept of several subject data-administrators within a large company.

In the early days of DP, one technician (such as the programmer/analyst) assumed responsibility for the majority of DP-related tasks. As DP became more specialized, the traditional roles of DP personnel were divided between software and hardware responsibilities.

This boundary lay between the personnel in and around the computer room and those external to computerized hardware and facilities. These personnel were typically labeled operations and applications.

The recent impetus to management information as a corporate asset has affected the way DP professionals are organized and created new specialists within DP. These new specialists are data-oriented, whereas the traditional DP roles are process-oriented (Figure 5, ID/31).

This segregation of responsibilities is advantageous for two reasons. First, specialization should permit personnel to narrow their range of responsibilities and thereby produce a higher quality product. Second, it can relieve conflict between the data administration and data base administration specialists.

This is particularly true if the data analyst (responsible for logical data base design) reports to data administration, yet the data base analyst (responsible for physical data base design) reports to systems development or a separate data base administration organization. Third, it improves the coordination and communication among data-oriented specialists.

However, the situation pictured in Figure 5 requires that the systems

SEARCH® and you will FIND...
...Even faster than Spot!

Spot's friendly and so is SEARCH...
Spot's smart and so is SEARCH...
Spot finds things that are lost and so does SEARCH...
Spot can be your best friend...
...and SEARCH will be your business' best friend

If the system you use makes it difficult to find information, you need **SEARCH**.

SEARCH is the information retrieval software that provides fast, comprehensive searching and display of all types of textual documents — letters, memos, reports, contracts, proposals — from one page to hundreds of pages.

SEARCH is the only program that lets you store and retrieve information in its natural state — **original text**. It's easy to use because it stores and retrieves the way you write and think. Your word processing output can be the input to **SEARCH**, eliminating the need to index or tag specific parts of your text for retrieval. Every word is stored for searching, even the full text of long, multipage documents.

SEARCH was developed by BRS, one of the largest online systems in the world. Its design reflects the experience of thousands of information professionals performing millions of online searches.

Power...
Flexibility...
Ease of Use.

SEARCH is the ultimate retriever for all your information management needs!

See us at Booth #1260

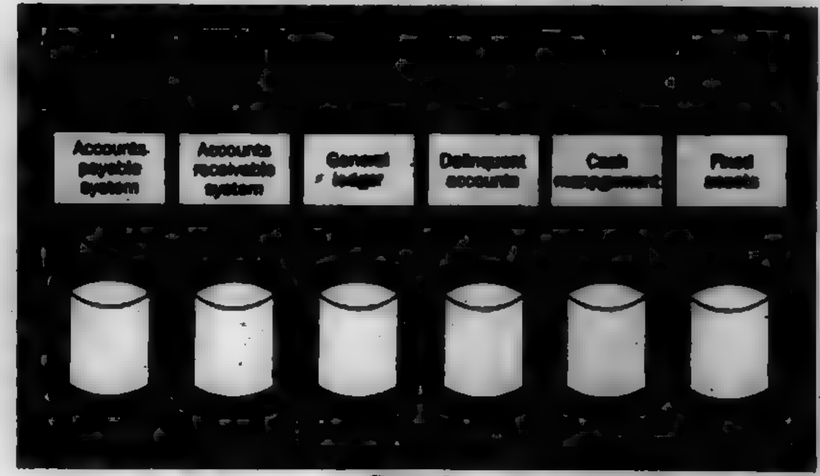

Figure 4

development staff relinquish responsibility for the design and maintenance of data structures. Systems analysts or programmer/analysts have traditionally designed and developed their own tables, files, records and data bases. The data monopoly illustrated shifts this responsibility to data administration.

The pride of ownership issue involved in this transition is a very real one. The data administration is committed to tearing down the data ownership walls that stand between application systems and to socializing the ownership of information among all applications.

The sharing or use of external data by an application-oriented staff is not easily achieved. Typically, various application development groups operate autonomously and develop their own data structures to support privately developed systems. The "not invented here" attitude toward foreign data bases is as real as the resistance to buy "not built here" proprietary software packages.

End-user tasks

In pursuit of its goals, data administration often displaces the data analysis and design responsibilities traditionally assumed by systems analysts and programmers and encourages assumption of these responsibilities by the end-user organization whenever possible.

In some organizations, responsibilities such as data element definition and naming, information modeling, user-view synthesis and logical data base design have been successfully completed by end-user staff. Often, these activities are performed by end users with only the supervision and guidance of data administration.

This shift in the responsibility of data analysis and design is yet another example of the gradual but steady transfer of tasks from DP-oriented systems development to user-oriented development. Thus, data administration is a catalyst in the transfer of traditional DP responsibility to the end user.

The data administrator feels that, whenever feasible, DP should get out of the "process" (applications or programming) business and concentrate on the business of managing and inventorying information for use by the end user. Data administration emphasizes not only the rigorous analysis and design of information but also the prototyping of processes by end users, using fourth-generation languages.

A strong data administration model dictates that DP should concentrate on the acquisition, control, security and management of data for the end user but that the end users themselves should be allowed to control how this data will be reported and used. Because of these factors, data administration is sometimes perceived as a further threat in the displacement of DP responsibility to the end user.

And data administration is circumventing DP in other ways. First, the data administration encourages the design and storage of all logically related data in one repository. This consolidates the information needed by the end users and eliminates the

ECONOMY

The #1 3270 alternative for people who value a better bottom line.

More and more companies are building or expanding their 3270 network at a lower cost without compromising performance. The solution: Telex.

The Telex 078 and 079 displays bring full 3270 terminal performance and user comforts together with cost savings. These complete 3270 plug compatible displays are loaded with standard features. They're ergonomically designed to save space and flexible enough to support a display printer, extended highlighting, APL, a light pen and a choice of keyboards.

And to make top performance and low cost an even better value, Telex backs its products with over 2,000 Telex-dedicated service and support people worldwide.

That's why so many companies value Telex as their #1 3270 alternative. And that's the bottom line.

For more information contact John Hawkins, 6422 E. 41st Street, Tulsa, OK 74135/1-800-331-2623.

Maple Leaf Technology

What's Maple Leaf Technology?

It's Canadian data communications technology from Develcon Electronics.

Develcon has been at the forefront of data communications for years.

But not just in Canada.

We've been operating in the United States since 1978. And we've been selling around the world since 1979.

Designing and installing systems of all sizes. For people like **NASA**, the **United States Senate** and **General Electric** in the U.S., **Volkswagen** in West Germany, and **Hong Kong Telephone** in Hong Kong, to name just a few.

All of which isn't really surprising.

Fact is, Develcon engineered the very first intelligent data switch in the late 1970s.

In 1983, we were one of the first companies to offer a truly distributed data networking product.

Little wonder our success has spread beyond our Canadian roots.

So if your needs call for a small switching system, there's no better company to call.

Develcon has modems, multiplexers, switches, and the experience to give you the best solution.

If you require advanced and sophisticated networking technology, there's **Develnet** – today's most flexible and adaptable data communications network.

Still, you should see for yourself why so many companies are looking north to Saskatoon for the answers to their data communications needs.

For free brochures detailing our transmission, switching and networking products, call our toll-free number:

1-800-667-3740 or write to:

Develcon Electronics
856 51st Street East
Saskatoon

The Northern Light in Data Communications

need for data processors to sort, merge, synthesize, filter and extract data from several sources in order to present it to the end user.

Second, the data administrator advocates the storage of data in more user-friendly tables (called relations or relational data bases). Data is formatted and represented in rows and columns and is more accessible than it would be in traditional hierarchical or relational data bases. It appears as spreadsheets and does not require translation or interpretation by the DP professional.

Third, metadata — documentation about the data — is prepared by the data administrator to permit the end users do their own retrieval of needed data. The data dictionary represents a self-service index of information.

Technology conflict

Another potential conflict between data administration and DP concerns computer technology. Data administration tends to be more business-oriented, and DP tends to be more technically oriented.

Data administration stresses the need to understand the relevance of information to the competitive success of the business. DP tends to concentrate on how the machine or software can most efficiently use data. The data administrator feels that it is part of his job to understand the nature of the company's business, what data is most important to the success of that business and how best to manage this data.

There are several reasons for the technical orientation of DP. First, DP was established to manage computers and computer support staff, not necessarily information. DP management is directed to manage the finances of computer equipment and personnel, not to improve the profitability of the company via better data and better business decisions.

Second, monetary rewards traditionally have been associated more with technical expertise than with business information expertise; therefore, DP personnel have commanded relatively high wages because of their technical knowledge.

But the data administrator relies on an understanding of the overall business and its data more heavily than on computer technology. This is indeed a monetary threat to those DP professionals who are fearful that their technical knowledge will be devalued.

And their concern is legitimate to some degree. It is relatively easy to become proficient in IBM software and hardware technology and to sell your skills from one company to the next. It is much more difficult to specialize in the information needs of an aerospace company and then change your career to an insurance business.

> ”
>
> *Data administration stresses the need to understand the relevance of information to the competitive success of the business.*

Impact on end users

Traditionally, DP management instigates the development of single-application computerized systems to respond to requests for DP services from individual end-user departments. Thus, the DP staff consists of distinct groups of programmers and systems analysts servicing separate end-user units.

For example, a centralized personnel system is developed and maintained under the direction of the personnel systems project leader. The development of this system was sponsored, funded and finally accepted by the personnel department.

Likewise, a centralized payroll system is developed and maintained under the direction of the payroll systems project leader for a single end-user organization — the payroll department. This scenario is typical of many other DP systems that have been built in a piecemeal, uncoordinated fashion.

There are several unfavorable consequences of this method of development. The first is that end-user management is expending funds and staff to support redundant data — each department maintains complete employee records.

If you buy a TI 855 printer now, you won't have to upgrade to one later.

Don't tack just any printer on your new PC for now, thinking that you'll get what you really need later. Start with the best, a TI 855 or TI 865 printer. That way you can put the money you'd have spent on a needless upgrade on some other smart investment.

You see, our OMNI 800™ Model 855 is actually three printers in one. For word processing, it delivers letter-quality printing that rivals the best daisy wheel printers around. For data processing, it prints at 150 characters per second. And for your graphics, it reproduces screen or monitor images in the finest detail.

Of course, these advantages are all true of our TI 865 wide-carriage printer, too.

What's more, since our printers are among the easiest to use, you can utilize all the capabilities built into your PC and software right from the start. Instead of sometime later. You even have a choice of over 30 different plug-in type fonts, any three of which can be printed on the same page without ever stopping the printer! Just touch the control panel and it happens. Simple. So every document looks just the way you want it to. Professional.

As for reliability, TI printers are legendary. Just ask any major airline.

So don't downgrade your PC's performance with a printer you'll outgrow in a month. Get yourself a TI 855 or TI 865 printer now. It's easy. Just call 1-800-527-3500, ext. 801, for the TI Dealer near you.

The second is that excessive DP staff must be committed to develop and maintain duplicate systems and data bases that support this redundancy. Furthermore, a network of additional interface software, controls and auditing capabilities must be built to maintain consistency of data between the two systems.

Duplication costly

Because of the complexity of both data and processes, the systems are more costly to maintain. The elapsed time to make enhancements increases, and the responsiveness to changes requested by the users often decreases. This situation also limits the availability and accessibility of employee information to each user area.

For example, the payroll supervisor may not have access to data maintained on the personnel data base, and the personnel manager may be ignorant of certain employee information available on the payroll data base.

The data-driven approach to human resource allocation dictates that payroll and personnel data be consolidated into a single subject data base of employee information. This data-driven approach requires significant changes on the part of end-user management.

Joint funding

The most significant change is that the two departments must share the funding for the development of a common data base. This joint funding arrangement often requires considerable marketing efforts on the part of the data administrator.

The cost for this common data base can be itemized as follows: information modeling for employee-related data, data element standardization and definition, logical data base design, physical data base design, conversion of existing payroll data and conversion of existing personnel data.

Assuming that a shared-funding arrangement can be accomplished, the next most formidable challenge arises during the design of the data base itself. The data administrator has the unenviable job of arbitrating between the two user areas concerning the standardization and consistency of the data to be stored in the data bases. Data element definition, format, length, edit requirements and code values must all be standardized between the end-user departments.

Drastic differences in data naming and format might exist between the data owned by each user area. For example, the employee salary field on the existing payroll files could be represented as a weekly amount, but on the personnel file this could be stored as an hourly amount.

The data administrator must be tactful and diplomatic in order to persuade the departments to arrive at some equitable information definitions for the common data base.

The end-user organizations must also address the data ownership issue. Since common employee-related information will now be maintained by both departments, it is essential to reach agreements concerning individual responsibilities for inserting, changing and deleting employee data. Data deletion or archiving can now be permitted only with the advise and consent of both end-user departments.

> **"**
>
> ***Because data base administrators concentrated on the local management of individual data bases, data administration was created to fill the void in the global management, coordination and consistency of all corporate information.***

Often for the first time, the shared data base environment requires user involvement on data ownership and security issues. Because the common data base can now be accessed by a greater variety of users, all end-user organizations should implement formal data security procedures for employee data.

Most data base administration organizations were created to control and coordinate DBMS activities and data base interfaces with application programs.

Data base administrators were usually assigned to develop and maintain application-oriented data bases and single data base systems. The administrators were usually only responsible for physical data base design.

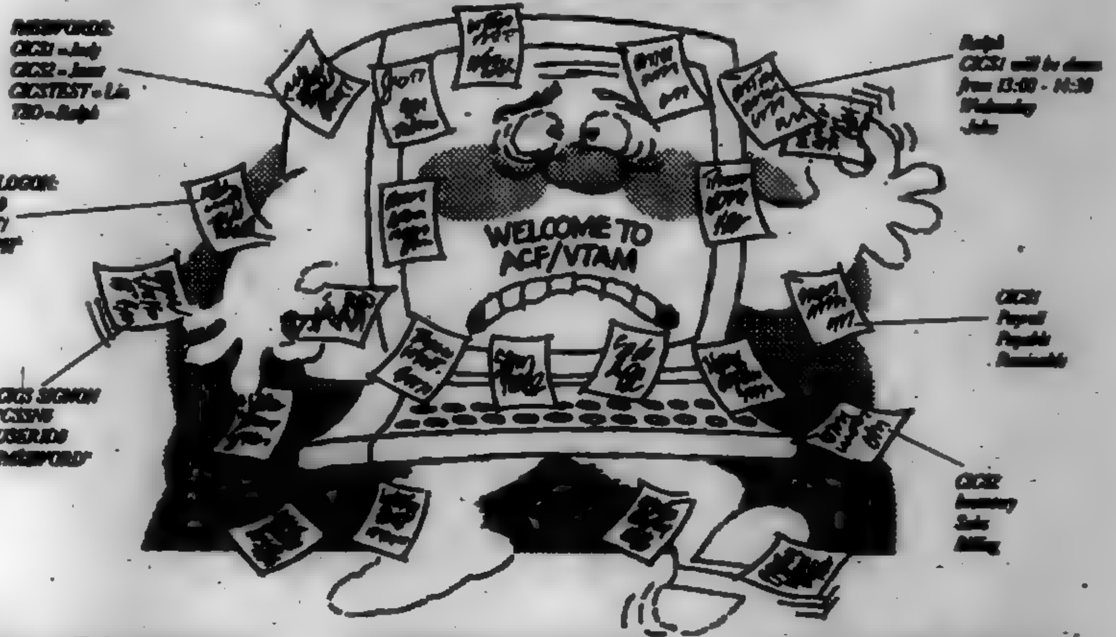
The data analysis and requirements were often dictated by applications development. Thus, data base administration had little if any, control over data redundancy or the planning of a data base across multiple systems.

Because data base administrators concentrated on the local management of individual data bases, the data administration function was created to fill the void in the global management, coordination and consistency of all corporate information.

Umbrella organization

The data administration organization in many companies has evolved as the umbrella organization containing the data base administration

Are sticky yellow notes a major part of your VTAM Network?



Then meet THE NETWORK DIRECTOR™ and start making your VTAM Network:

- More manageable
- More secure
- User simplified

With THE NETWORK DIRECTOR from North Ridge Software there is no need to thumb sticky yellow notes out of the way. At the touch of a PF key THE NETWORK DIRECTOR acts as a front-end to your VTAM-based terminal network, managing user access to all your subsystems—CICS, IMS, TSO, IDMS, CMS, and MODEL 204 to name a few. And it checks with your security package (ACF2, RACF, TOP SECRET, etc.) in advance to see if the user can connect to the subsystem.

THE NETWORK DIRECTOR can then automatically sign-on the user to your subsystems, and if you wish, pass an initial task and initial data, with one touch of a PF key. It provides a personalized menu for each user based on name, location and time-of-day, and automatically tells users when subsystems are up or down. On a global, network-wide level you'll like the help function, message switching, broadcast facility, full cross-domain support, and network administration capabilities.

THE NETWORK DIRECTOR is available for IBM Mainframes utilizing VTAM.

For more information please mail the coupon today to North Ridge Software and discover that installation and trial of THE NETWORK DIRECTOR can be as easy as throwing out those sticky yellow notes. Or give us a call at 206/455-9809. (TELEX: 328-951 (BUS SER BVUE)).

staff. Because the data administrator and the data base administrator specialize in logical and physical data base design, respectively, the potential exists to create some antagonism between the two specialties.

Shifts and conflicts

Data administration is chartered to maximize the flexibility and modularity of data base design, which tends to degrade the performance of the data base and thus to conflict with the goals of data base administration.

Placing data base administration within data administration reinforces for the data base administrator the importance of reducing data base labor costs, and data base machine costs become secondary in importance. Thus, the traditional data base administration responsibility — machine optimization — becomes secondary to the data administration responsibility — labor optimization.

The shift in emphasis from machine costs to labor costs is one indication of the gradual but steady shift in importance from data base administration to data administration. Relational data bases (as advocated by data administration) can also have significant ramifications for data base administration. Since relational data bases are easier to use and understand than other types of DBMS, the need for the data technician in data base administration diminishes.

In a relational environment, logically analyzing and modeling the information prior to physical data base design becomes critical. Because normalized data is much more fragmented than typical raw data, the need to understand the logical relationship of information between relations also becomes critical.

Thus, in a relational environment, the need for data administration increases, and the need for data base administration should decrease.

The metadata maintained on the data dictionary also decreases the end-user reliance on data base administration staff for information concerning the contents of the data base. Also, data base machines can potentially reduce the need for human involvement in data base backup, recovery and reorganization. This will further erode the importance of data base administration.

The data administrator

The misunderstanding about data administration and its provocative nature have certainly taken their toll on the data administrator and the data administration organization itself. Some organizations have made several attempts at data administration before finally achieving some level of success.

Compared with other professions, the turnover rate of data processors is above average. However, the turnover rate among the data administration staff appears to be higher than that of other DP staff members.

Significantly, although this turnover rate is high, few data administrators leave data administration to return to traditional DP ranks outside of data administration. On the contrary, most unhappy or unchallenged data administrators will shift companies but not roles.

Most data administrators are more dedicated to their profession than to their employer. Although there is a great deal of skepticism, pessimism and uncertainty surrounding data administration, many data administration personnel are convinced of the necessity of their roles and dedicated to the task. The typical data administrator is convinced that the global planning, management, control, inventory and integrity of information are essential to the long-term profitability of an enterprise.

About the author

William Durell is president and founder of Data Administration, Inc., a California corporation that specializes in information resource management. During his 13 years in DP, he has worked as a programmer, systems analyst, project leader, data analyst and data administrator. He is the author of Data Administration, *a guidebook on the implementation of data administration.*

MICROCOMPUTERS

HP offers Laser Jet Plus in high-end printer mart

By Jeffry Beeler

CUPERTINO, Calif. — Hewlett-Packard Co., seeking to address the high end of the personal computer printing market, has complemented its original Laser Jet printer with an enhanced model that yields improved output quality.

HP also trimmed the price of its existing Laser Jet from $3,495 to $2,995 — a reduction of slightly more than 14%.

As its name suggests, the new Laser Jet Plus is targeted at the portion of the microcomputer laser printing market that HP's first offering intentionally ignored. Announced in May 1984, the vendor's original Laser Jet model is configured to address 80% of the market for office personal printers.

Now, with the introduction of Laser Jet Plus, HP is reportedly taking aim at the remaining 20% of the market, which demands higher-than-average print quality and is willing to pay a reasonable premium to get it.

The new device's key difference is expanded memory. HP has equipped Laser Jet Plus with 395K bytes of user storage, compared with the original version's 56K bytes, according to Roger Archibald, a project manager with the firm's Boise, Idaho, division.

Expanded memory yields improved resolution and output clarity. When producing full-page images, Laser Jet Plus can squeeze 150 dots into a single inch, vs. 75 dot/in. for its predecessor, Archibald said. For half-page images, Laser Jet Plus' resolution improves to 300 dot/in.

The increased dot density enables the latest member of the company's laser printer family to create characters and graphics exceeding the capabilities of the original Laser Jet model. Laser Jet Plus, for example, can print characters as large as 128 dots high, compared with the previous HP limit of 64 dots, Archibald said.

The system's superior resolution also reportedly lends a sharpness and a professional look to forms and graphics that otherwise would fall noticeably short of letter quality.

Laser Jet Plus' other main features include the ability to store up to 32 electronic forms in its internal memory and to download additional forms, logos or letterheads, Archibald said. The enhanced unit can also download fonts and thus circum-

Add-on graphics processor out

Superset, Inc., based in San Diego, has announced an add-on processor that reportedly supports 48-bit, virtual memory mainframe graphics on the IBM Personal Computer, XT and AT.

The XP/48 Graphics Extension Processor is said to support 4096- by 4096-pixel resolution graphics, 24-bit color depth and graphics such as bar charts, exploded pies, shaded fonts, three-dimensional surfaces and axes and spline or polynomial curves.

Other features include full digitizer support, user extendable fonts and multipass rasterization with halftoning, paneling and color separation.

The basic system consists of an expansion bus card and a cabinet with a 48-bit virtual processor, 400K-byte error-correcting memory and a 20M-byte hard disk.

Based on Fortran

The XP/48 is Fortran-based, with a Fortran 77 compiler and debug facility.

The XP/48 is said to support all of Superset's graphics applications packages, including interactive data-driven graphics, device independent plot manager, solids modeler and large-scale Personal Computer board schematic design with autorouting.

The system will be available in November for a base price of $10,000.

SMALL TALK
Edward Warner
CW Senior Writer

MMA, Tasc: joint venture?

The Microcomputer Managers Association (MMA), a group of executives representing approximately 100 New York corporations, is holding its annual meeting in New York this week amid events that call into question its very existence.

The organization, which sprang up just more than two years ago, once promised to represent the voice of corporate personal computer managers nationwide, as Share and Common do for IBM mainframe users.

Regional branches of the organization formed in the Midwest, Boston, Dallas and Minneapolis. MMA President Alan Gross was talking of forming an umbrella organization that would speak for microcomputer managers nationwide.

Such a group was formed by microcomputer managers early this year, but it's not a national MMA.

The group calls itself Technology Advancement through Strategic Cooperation (Tasc), and one of its first acts was to put some distance between itself and the MMA, which it said was more interested in antagonizing vendors than cooperating with them.

Gross denies that the MMA of New York is taking an antagonistic pose. The MMA did, however, issue a white paper to software publishers at a personal computing trade show in New York this summer. The paper called for site licensing and an end to copy protection, two things large software publishers have been loath to provide.

Tasc accepts vendors as members and, according to Tasc President Robert Corr, sees itself as embodying, in its cooperativeness with vendors, the spirit

IBM SQL/DS and DB2 relational DBMS now on PC

ORACLE, the relational DBMS compatible with IBM's SQL/DS and DB2, is now available on the IBM PC/XT and PC/AT. While SQL/DS and DB2 run only on IBM mainframes, ORACLE runs on IBM mainframes as well as on DEC, DG, HP and most other minis and micros. Any application written for SQL/DS or DB2 will run without modification on the complete range of systems supporting ORACLE, including PCs.

SQL/DS and DB2 are relational database management systems; ORACLE is a relational DBMS plus an integrated set of 4th generation software tools for application generation, report writing, color graphics and network communications.

Oracle Corporation introduced the first relational DBMS in 1979. Now, ORACLE provides the only complete implementation of the IBM-standard SQL language available for the PC.

Oracle Corporation cites three principal application areas for its product's capabilities:

■ **The ORACLE Application Development Center** provides a PC-based development center for the creation of DB2 and SQL/DS applications. The flexibility of the personal computing environment is made available to programmers creating applications for use with IBM's relational database products.

■ **The ORACLE Personal Information Center** extends the Information Center concept to the Personal Computer. ORACLE's application generator, graphics, spreadsheet and other end-user tools provide a SQL/DS and DB2 compatible Information Center on the desktop.

Users can become acquainted with the facilities and power of the Information Center in the personal computing environment, and transfer their knowledge and skills as the MIS Information Center facility evolves. The ORACLE Personal Information Center provides the facilities for MIS to develop the cooperative relationship with end users so vital to the success of the Information Center.

In addition, with ORACLE on departmental superminis, users can create identical Information Centers at the department level.

■ **The ORACLE Distributed Information Center** provides an intelligent set of communication links among multiple systems, with ORACLE running on IBM mainframes and various minis and PCs.

Using ORACLE's SQL*LINK networking facility, ORACLE on such diverse systems as MVS, VM/CMS, VAX/VMS, UNIX and PC/DOS can selectively exchange database information using the full capabilities of the SQL language. Applications, portable across all environments, can be run identically on any system, and data can be intelligently extracted for use at any site.

ORACLE is currently installed on over 1000 supermini and mainframe systems around the world, as well as on thousands of PCs and compatibles. Oracle's customers include 8 out of the 10 largest U.S. corporations, as well as major foreign companies and many government agencies.

For further information, contact Oracle Corp., Dept. C, 2710 Sand Hill Rd., Menlo Park, CA 94025, or call 415/854-7350.

Harris micro compatible with IBM

Harris Business Information Systems/Lanier Business Products, Inc. in Atlanta introduced its first IBM Personal Computer-compatible microcomputer.

The Concept 2000 is based on the Intel Corp. 8088 microprocessor chip running at 4.77 MHz. The product runs the Microsoft Corp. MS-DOS 2.11 operating system and uses the Phoenix Software Ltd. basic I/O system.

The basic configuration includes 256K bytes of memory, reportedly expandable to 512K bytes on the motherboard without using expansion slots. The board includes two serial ports, one parallel port and a real-time clock with battery backup.

The system is available with dual floppy disk drives or one floppy and one 10M-byte Winchester drive. A 14-in. color or monochrome monitor is included.

Later product offerings will allow users to interface with other operating systems and communicate on the Harris/Lanier Concept 6000 office automation network, according to the vendor.

The Concept 2000 is priced at $2,995.

McDonnell Douglas unveils analyst aid

Software designed to aid systems analysts in the preparation of data flow diagrams has been introduced by McDonnell Douglas Professional Services Co., which is located in St. Louis.

The Prokit-Analyst software reportedly runs on the IBM Personal Computer XT or AT and uses structured analysis techniques to create a data base for software systems design.

The software permits analysts to draw and edit data flow diagrams while the system produces and updates an applications directory at the same time.

Dictionary analysis

The product reportedly provides dictionary analysis and documentation, with automatic creation of the applications data dictionary.

It also offers full integrity checking, under which it enforces standard rules on the user as the user creates and updates data flow diagrams.

With Prokit-Analyst, reports may be generated that include all necessary data dictionary listings as well as the definitions of the relationships of symbols and warnings of imbalance conditions within a diagram, the vendor said.

Those reports also relate the entries in the dictionary to the data flow diagrams, according to the vendor.

The software will operate in conjunction with a mouse and requires a color graphics interface board. It is priced at $2,450.

SOFTWARE

■ **Syscomp has announced a software program that reportedly allows users of Lotus Development Corp. Symphony Release 1.1 to access up to 4M bytes of virtual memory without expanded memory boards.**

VMSYM runs on the IBM Personal Computer, Personal Computer XT and Personal Computer AT running PC-DOS 2 or higher. The product switches data between the computer's conventional memory and its fixed disk or a device simulating a fixed disk. It requires 640K bytes of memory.

VMSYM is priced at $75, the vendor said.

Syscomp, Suite 210, 8525 Aero Drive, San Diego, Calif. 92123.

COMMUNICATIONS

■ **Quadram Corp. has introduced its Quad3278 gateway board, a micro-mainframe communications board for local-area networks.**

Quad3278 reportedly offers a link between local-area-network-based IBM Personal Computers and mainframe hosts based on the IBM Systems Network Architecture.

It supports PU Types 1, 2 and 3 communications and emulates an IBM 3274 Model 51C/61C remote communications controller. It also provides for IBM 3278-type display emulation and offers four-color IBM 3279 emulation and IBM 3278 printer emulation.

The Quad3278 reportedly includes 512K bytes of memory and the National Semiconductor Corp. 32016 microprocessor. It is sold in three versions, offering support for eight, 16 or 32 logical units on a local-area network. The versions are priced at $4,529, $4,983 and $5,742, respectively.

Quadram, 4357 Park Drive, Norcross, Ga. 30093.

■ **Bellsoft, Inc. has announced an enhanced version of Pop-Up Telecomm communications software for the IBM Personal Computer, Personal Computer XT and 3270 Personal Computer using a Hayes Microcomputer Products, Inc. modem or compatible equipment.**

Version 1.5 includes an enhanced Pop-Up modem component that is said to support modems transmitting at 2,400 bit/sec. and to provide direct

WHAT DOES DOCUMENTATION HAVE TO DO WITH PRODUCT SALES AND CUSTOMER SUPPORT COSTS?

More than you might think.

This year the documentation specialists at Xanthus conducted a national survey on consumer and reseller attitudes toward documentation. The results were clear.

Documentation influences consumer buying decisions. Why? Because documentation is more important to computer users than ever before. It's become a major selling point.

Documentation also affects product support costs. If your documentation is effective, you won't have to spend as much on customer training and support costs. And that can help reduce your overhead.

How does your documentation measure up? You can find out with the Xanthus documentation evaluation service. Your documentation will be evaluated according to the survey results. Plus you'll receive a complete report, including recommendations for improvements. Improvements that increase sales and reduce support costs.

Find out more about this special service and the other documentation services Xanthus provides. Call (512) 450-0044 or write to the address below.

Visit our hospitality suite at UNIX EXPO, September 18, 19, and 20.

Reach over 30,000 Australian computer professionals.

Advertise in CW Communications' Australian publications and sell your products directly to Australia's thriving computer community. According to International Data Corporation (IDC), the world's leading information industry research firm, there are more than 2,300 mainframe computer systems installed in Australia and more than 333,000 computers of all types. CW Communications covers the Australian market with five important publications.

10,000 MIS/DP executives read *Computerworld Australia* each week. *Computerworld Australia* covers new products and services, current applications and industry trends. *Computerworld Australia* subscribers will also receive *On Communications*, a quarterly publication for communications professionals which helps readers plan their communications strategies. And, on the third Friday of each month, an additional 12,000 readers receive *Australian Microcomputerworld*, a supplement with in-depth information on the microcomputer industry.

Twice each month, 12,000 IBM PC owners and potential buyers turn to *Australian PC World* for timely information about IBM PCs and compatibles.

Australian Macworld is the only magazine in Australia for the Macintosh user community. This bi-monthly publication reaches over 12,000 owners and potential owners of the Macintosh.

CW International Marketing Services makes advertising your products in Australia, and around the world, easy. We have over 50 publications in more than 25 countries. For more information on our wide range of services, complete the coupon below and mail today.

Now all anyone needs to access your database is the ability to understand a few simple commands.

From now on your end-user won't suffer days of frustration waiting for you to get the time to handle a database query.

Because from now on he can do it himself. In minutes.

Introducing THORN EMI's Friendly Query System. It runs on your IBM mainframe, and it's menu-driven. It's so easy to use, you don't even need a user's manual.

All your end-user has to do is type his name and access code. The software itself tells him exactly what to do next. To retrieve any kind of information, for any kind of report. And the only computer language he needs to know is English.

Which means no more jumping through hoops to clear stacks of database information requests off your desk. Stacks that may be backlogged six weeks. Or six months.

FQS can be installed by your staff in under two hours—or about twice the time it takes to teach an end-user to master it.

So if you can still find your phone behind those stacks of database information requests, call THORN EMI for a 30-day free trial. Just ask for FQS, the software that teaches your end-users to fetch for themselves.

Call 1-800-525-4025.

Microsoft launches first net application package

By Eric Bender

BELLEVUE, Wash. — Microsoft Corp. late last month rolled out its first network application, a version of the Microsoft Word word processing package that runs on most IBM Personal Computer local-area networks. The move by the second-largest independent microcomputer software vendor will help accelerate the trend toward micro networks, analysts and vendors agreed.

Available Sept. 15 for $1,195, Microsoft Word for Networks establishes licensing practices that suppliers will follow for future network applications, product manager Charles Stevens said.

The basic package includes software and manuals for five network nodes, with pricing set at three times the single-user price, Stevens noted. Microsoft Word for Networks will be sold through the company's key dealers, who will be able to split open the five-node package for customers who want to install the software on more than five but fewer than 10 workstations, he said.

Not copy protected

Unlike the single-user versions of Word, the network software is not copy protected, Stevens said. Microsoft dropped copy protection because "it degrades performance of the product on the net and inconveniences users," he explained.

The company chose Word for its first network application because "it's one of our major products, and there was a lot of demand," Stevens said. "Word naturally lends itself to a networking environment" with one prime feature being support for the laser printers that many users want to share on a network, he maintained.

Microsoft, which expects 30% to 50% of business micros to be networked within the next couple of years, currently is evaluating the market potential for network versions of Project, Chart, Multiplan and others among its offerings, Steven said.

The Word package is "the first word processor that really tries to take advantage of a network," he said. Both style sheets, which can save formats and automatically apply them to varied documents to give them a standard appearance, and glossaries, which allow users to store frequently used boilerplate text, can be shared among various users in a work group.

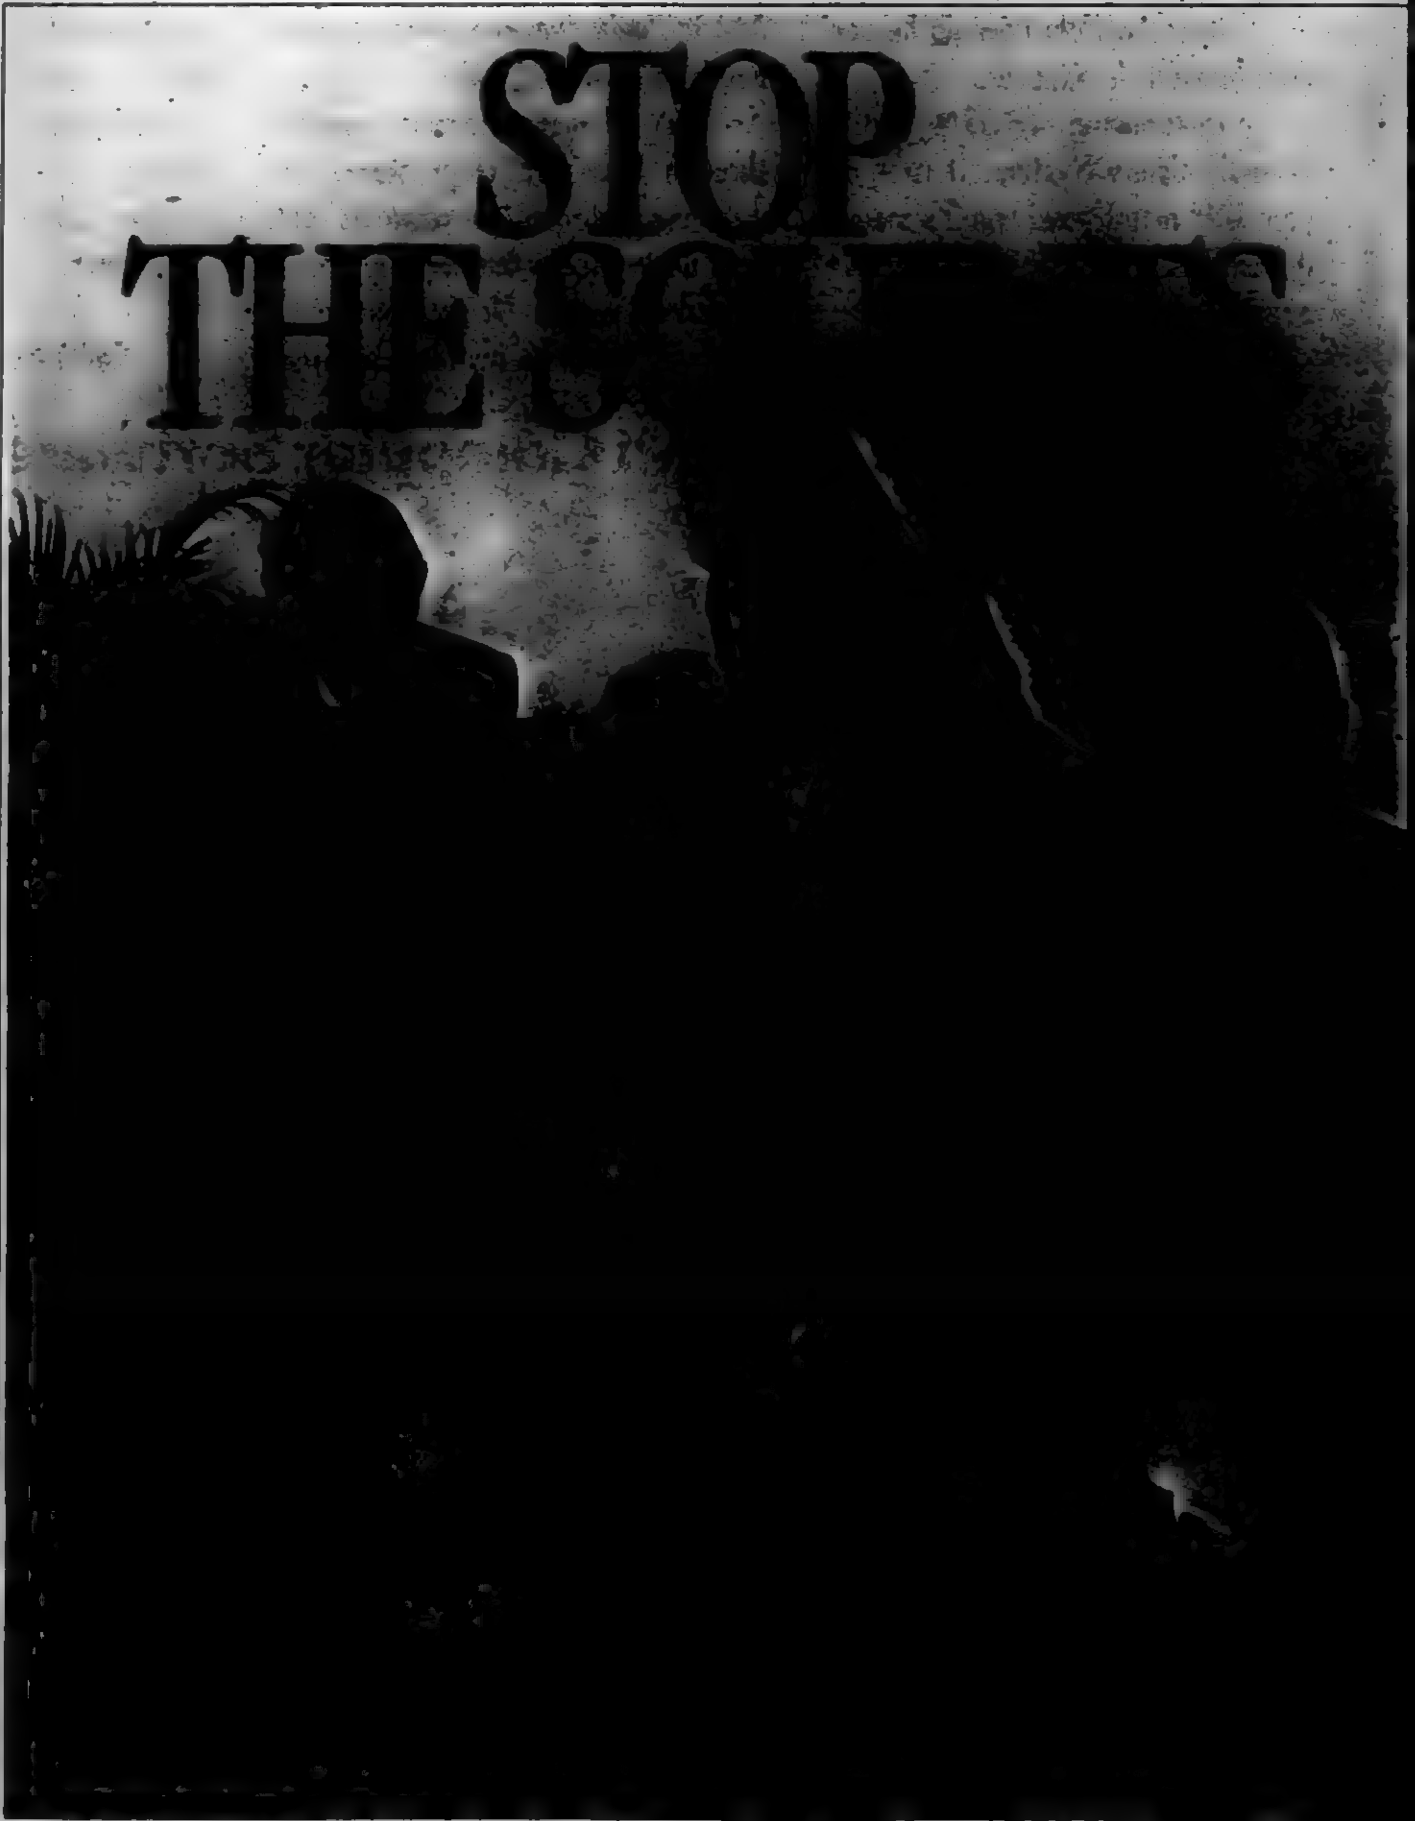
Tracor Applied Sciences, Inc. in Rockville, Md., which installed a beta copy of the program on a Corvus Systems, Inc. Omninet, has been very pleased with the overall results, according to technical editor Michael Kleinbeck. Acting as a contractor to the Naval Electronic Systems Engineering Activity, Tracor found the style sheet and glossary features particularly useful, Kleinbeck said.

"Dealing with the government, you're dealing with very rigid style formats," he pointed out. Once the styles are created on the network, new users automatically print out documents in the proper formats. Glossary functions prove useful because of the government's fondness for long titles and obscure acronyms, he added.

The ability to move to a network version was one critical requirement when Tracor began talking with Microsoft about standardizing on Word 1½ years ago, Kleinbeck said.

Word for Networks will run on the IBM PC Network, other networks compatible with the Microsoft Networks system software or on existing networks supplied by AST Research, Inc.; Corvus Systems; Fox Research, Inc.; Nestar Systems, Inc.; Novell, Inc.; Orchid Technology Co.; 3Com Corp.; and Ungermann-Bass, Inc.

The program supports file locking, either through MS-DOS 3.1 routines or through network software in existing MS-DOS 2 networks, Stevens said. Network print spooling and print job separation also are supported. The software



may be installed multiple times on a file server, so that the server may be reorganized or repartitioned any number of times.

A spelling checker permits the creation of specialized dictionaries shared among all users or dedicated to an individual user. A mail merge facility can draw data from a common mailing list on popular data base management programs like Ashton-Tate's Dbase III and Dbase II or Microrim, Inc.'s R:Base 5000 and R:Base 4000, Microsoft said.

The package requires PC-DOS or MS-DOS 2 or higher and a file server with a hard disk drive. Each workstation must be equipped with 256K bytes of random-access memory, with 320K bytes recommended, but a disk drive is not required.

Existing Word users with at least three copies can upgrade to the network version for $395. ■

String of vendors unveiling net tools

With its introduction of Word for Networks, Microsoft Corp. has joined a string of micro software vendors that are announcing network packages, industry observers noted. Among these, another major supplier, Multimate International Corp., began shipping net versions of its word processing software late in July.

Now that Microsoft has moved into net applications, "we may see others get off their duff and do something," predicted Paul Cubbage, senior industry analyst at Dataquest, Inc. "The big question mark is [Lotus Development Corp]."

Another key player is Ashton-Tate, which promised a network version of its best-selling Dbase III package when the software debuted in July 1984, Cubbage said. "I'd be surprised if that didn't come out pretty soon," he added.

Cubbage downplayed the risks of piracy for the unprotected Microsoft Word for Networks. "I don't think it's going to be a significant problem," he said. "Corporate people pretty well understand what stance they ought to take."

Bill Krause, president of 3Com Corp., a Mountain View, Calif., network supplier, called Microsoft Word "an important step in the right direction." However, Krause said, the availability of network multiuser data base managers and general business applications, such as accounting packages, is more crucial to the acceptance of networks.

"Over the next three to six months, there will be an ongoing series of announcements from virtually all the major players for multiuser network software," he said.

Continued from page 78

connection support up to 9.6K bit/sec. It also includes Xmodem error checking data transfer protocol, emulation of Digital Equipment Corp. VT100 and VT52 terminals and support for automatic logon scripts.

The new version of Pop-Up Telecomm requires IBM PC-DOS 1 through 3.1 and is available for $79.95. Pop-Up Deskset Plus Version 1.5, which includes Pop-Up Telecomm 1.5 as well as a calendar, two calculators, disk file utilities, alarm clock and a text and file editor, is priced at $129.95.

Bellsoft, 2820 Northrup Way, Bellevue, Wash. 98004.

BOARD-LEVEL DEVICES

■ **Ten X Technology, Inc. has announced an expander board and software system that is said to allow the IBM Personal Computer XT and AT to run Texas Instruments, Inc. Business Computers minicomputer software programs.**

The X-Porter system consists of a board with the TI TMS99000 microprocessor and 512K bytes of local random-access memory (RAM) and TX10 software that emulates the TI DX10 operating system. The system reportedly supports most of the 10,000 applications software

"She keeps losing her RAM."

WITH A REAL EYE-OPENER

THE ELECTROHOME ECP 2000 COLOR COMPUTER PROJECTION SYSTEM.

As modern business continues to recognize the effectiveness of computer-projected data and images, The Squints continue to wreak havoc in boardrooms, training sessions, and trade shows. Wherever people are forced to view small color CRT-screens or dull and often fuzzy projected color images, you'll find The Squints running rampant.

STOP THE SQUINTS BEFORE THEY START.

The Electrohome ECP 2000 color data/graphics projection system is a real eye-opener – in more ways than one. To begin with, it's easy to use and interfaces with virtually all computer terminals and PCs, making it the most versatile color projection system on the market.

In performance, it's the heads-up winner. Electrohome's Vari-Focus Control allows simple optical focusing on screens from 5' to 14' diagonal – using only 3 handy knobs on the back of the unit. This exclusive Electrohome feature makes the ECP 2000 the easiest-to-set-up color projection system available today.

Electrohome's single lens system automatically converges colors within the unit to project a crisp, clear, consistently brilliant color image of all data/graphics and video. In fixed or portable applications, difficult, time-consuming set-ups and focusing are a thing of the past.

MORE EYE-OPENERS.

There are many other eye-opening differences that set the ECP 2000 apart from all other color projection systems on the market. For example, the ECP 2000 offers a 1,000 line lens and displays 1024 × 1280 pixels.

Advanced pincushion circuitry reduces eye-boggling distortion to an absolute minimum on curved, flat or rear screens. In addition, you get a maximum brightness rating of 400 lumens. Finally, sophisticated high voltage regulation assures image stability and overall performance dependability.

But the best way to judge the ECP 2000 is to see it for yourself. For more eye-opening information on how to Stop the Squints with the ECP 2000, the CAD/CAM 2000 for ultra-high resolution terminals operating at 30 – 65 KHz, or the EDP-58 monochrome systems, send your business card to:

THE BEST WAY TO KEEP YOUR COMMUNICATIONS FROM BEING TIED UP IS TO TIE THEM TOGETHER.

NETWORKING LINKS ALL YOUR VOICE AND DATA TERMINALS, WHEREVER THEY MAY BE. IT'S ONE OF MANY INTEGRATED FUNCTIONS OF AT&T SYSTEM 85 AND AT&T SYSTEM 75.

Everyone knows the old adage, "there's strength in numbers." That holds true only if the various elements, however numerous, are working together.

The Networking function of System 85 and System 75 from AT&T Information Systems unites all the elements of our business communications systems so everything works together. Whether you have offices spread throughout a building or throughout the country, they can all be linked productively into one network.

A NEW BUSINESS ASSET

A network should be looked at not simply as a communications tool, but as a business asset. Like any other asset your business holds, it too can be controlled and managed and made to work for you.

All our networks let you incorporate new applications, making your system more powerful than ever. And thanks to our integrated digital T-carrier interface, you can speed up and control the flow of not only voice, but data transmissions as well.

In a small area, like a campus, or even nationwide, look into our Distributed Communications System. With it, multiple systems serving up to 100,000 lines can function as one. It also offers extensive voice and data terminal transparency and attendant transparency, so attendants can control the entire system from one location.

Remote Groups let you extend System 85 capabilities to small locations via DS-1 facilities. Remote Modules serve larger locations, up to 2½ miles away, over fiber optics. Voice communications and data from host-computers are transmitted with complete user transparency.

An Electronic Tandem Network can also be used to link locations anywhere in the country. Through a mix of analog, high-capacity digital, and public facilities, virtually any number of voice and data terminals can be connected.

CONTROL AND ECONOMY

Once you've linked your communications into one network, you'll have a host of powerful features working to increase productivity, reduce costs and give you more control over your communications. Automatic Route Selection, Automatic Alternate Routing, and Queuing choose the least expensive path for all network calls. And "Authorization Codes" grant calling privileges to appropriate employees.

With all your offices under the umbrella of one system, networking can help create another business asset—a single, consistent corporate identity for every branch of your organization.

INVESTMENT PROTECTION

System 85 and System 75 are designed according to the guidelines of Information Systems Architecture. This ensures that any upgrades or future generations of the system will be compatible with the current one. So your investment is protected.

There are over 850 ETN's and DCS's already in place. More than half of the *Fortune 500* companies have chosen private networks from AT&T Information Systems. Besides our features, function and investment protection, there's one more compelling reason why—our service.

Our systems are backed by the largest sales and service staff in the industry. Network support includes predesign, cutover coordination, post-cutover administration, and ongoing maintenance. Add to that a century of communications experience and leadership, and your decision is easy. Of all your alternatives, only one is the right choice—AT&T.

To find out more about the Networking capabilities of System 85 and System 75, call your AT&T Information Systems Account Executive or 1-800-247-1212.

AT&T
The right choice.

programs for TI minis on the micro.

The X-Porter is compatible with DX10 Release 3.3 or higher, except for programs that read or modify DX10 data structures, programs that directly access TI Business Systems interfaces and programs that use the TI 990/12 extended instruction set.

The product requires 256K to 512K bytes of memory, the XT running PC-DOS 2.1 or the AT running PC-DOS 3 as well as one full-size slot and a 10M-byte hard disk (or larger, depending on the software application). A communications link is required to port the application from the TI Business System to the micro.

The cost of X-Porter is $2,825.

Ten X Technology, Suite B14, 3933 Steck Ave., Austin, Texas 78759.

■ **CXI, Inc. has announced a memory board that is said to expand random-access memory (RAM) of the IBM Personal Computer and Personal Computer XT by up to 256K bytes.**

The Memory/Plus board is designed for use with CXI's 3270 PC coaxial connection, 3270 remote connection, 3278/79 Plus remote connection and 3278/79 Standard remote connection. The board reportedly allows these products to address memory above the 640K-byte limit of the DOS operating system.

The Memory/Plus board is said to provide 256K additional bytes of RAM on the IBM Personal Computer, 192K additional bytes on the Personal Computer XT and 128K additional bytes on the Personal Computer XT with the IBM Enhanced Graphics Adapter. The product is reportedly organized in four 64K-byte memory blocks, which can start on any 64K-byte boundary up to 896K bytes.

The Memory/Plus board is priced at $396 and is available for $200 when purchased with supporting CXI products.

CXI, 3606 W. Bayshore Road, Palo Alto, Calif. 94303.

■ **Emulex Corp. has announced a monochrome display adapter card with an optional printer port for the IBM Personal Computer, Personal Computer XT and AT.**

The Persyst Mini-Mono Card is said to fit in a Personal Computer XT short slot or full-size slot in the Personal Computer or Personal Computer AT. It reportedly provides 80-char. by 25-row display, uses 4K bytes of main memory and performs direct memory access operations directly to or from the display memory.

The optional parallel port reportedly supports either Centronics Data Computer Corp. or Dataproducts Corp. printer interfaces.

The cost is $225 for the standard product and $250 for the printer port model.

Emulex, P.O. Box 6725, 3545 Harbor Blvd., Costa Mesa, Calif. 92626.

■ **Alloy Computer Products, Inc. has announced an add-in memory board for AT&T's Unix PC personal computer.**

The RAM-73 board is said to allow users to add 2M bytes of expansion random-access memory to the Unix PC. The memory is built on a plug-in card that requires one slot in the computer.

The board costs $1,495.

Alloy Computer Products, 100 Pennsylvania Ave., Framingham, Mass. 01701.

■ **Applied Reasoning Corp. has introduced PC-Elevator, a board for the IBM Personal Computer and Personal Computer XT that reportedly upgrades these machines to the performance level of the IBM Personal Computer AT.**

PC-Elevator is said to incorporate the Intel Corp. 80286 microprocessor and either 512K bytes or 1M byte of on-board memory. Also included is the software for its basic I/O system.

The product costs $1,695 with 512K bytes of memory. With 1M byte of memory, it costs $2,495.

Applied Reasoning, 84 Sherman St., Cambridge, Mass. 02140.

■ **AST Research, Inc. has introduced Colorgraphplus, a graphics adapter board for the IBM Personal Computer.**

Colorgraphplus is compatible with all software written for the IBM 4910 color adapter and occupies one expansion slot, according to the vendor. It offers two modes of display: alphanumeric and all-points-addressable graphics.

In its base configuration, the board reportedly provides up to 16 colors in its medium resolution mode of 320 by 200 pixels and up to four colors at high resolution, 640 by 200 pixels.

Colorgraphplus is priced at $295.

AST Research, 2121 Alton Ave., Irvine, Calif. 92714.

■ **Phoenix Computer Products Corp. has introduced an Intel Corp. 80286-based add-on board that reportedly increases the processing speed of the IBM Personal Computer, Personal Computer XT and compatible machines to exceed that of the Personal Computer AT.**

Pfaster286 uses coprocessor technology to speed up the data processing power by allowing the Intel 80286 processor to function as the system CPU, the vendor said. The product reportedly allows users to switch to native Intel 8088 mode without having to reboot the machine.

Pfaster286 costs $2,395. The 80287 option costs $350, and each additional 512K bytes of random-access memory is $400, according to the vendor.

Phoenix Computer Products, Suite 220, 1416 Providence Highway, Norwood, Mass. 02062.

■ **STB Systems, Inc. has announced an adapter board said to extend the graphics capabilities of the IBM Personal Computer, Personal Computer XT and AT.**

Only Softool's CCC™ Offers True Automatic Configuration Management!

That's why more and more major users are selecting Change and Configuration Control (CCC) ...there's no competition!

CCC Automates management of changes and configurations • control over who makes what type of changes and where • tracking of trouble reports • reconstruction of previous versions • document control • management reports • archiving • and much more.

CCC is Interactive and Friendly. It supports all programming languages, and comes with on-line tutorials.

CCC is a Proven Product. Over 1,500 Softool products are installed worldwide. CCC is supported on these computers: Apollo • DCL Ustation • DEC VAX • DG MV • Gould S.E.L. • Honeywell 6000 series (level 66, DPS 8/xx) • HP 9000 • IBM 370, 30XX & 43XX • Sun Microsystems.

CCC is the Solution for the 80's. It resolves the most important problem facing the software industry today: configuration *management*. CCC offers true configuration control…where all components of a given release can be managed as a unit.

There is more. CCC is a stand-alone component of Softool. An Integrated Programming Environment (PE™) is also available.

Call today for more details or a hands-on demonstration.

Reach over 40,000 computer professionals in Brazil.

Your ad in CW Communications' Brazilian publications will reach a multi-billion dollar computer market. At the end of 1984, there were approximately 9,000 mini and mainframe installations in Brazil valued at $3 billion. According to International Data Corporation (IDC), the world's leading information industry research firm, Brazil's mainframe market will grow 20% annually and micros are predicted to grow 50% annually over the next five years. CW Communications covers the Brazilian market with two important publications: *Data News* and *MicroMundo*.

Data News reaches 12,500 Brazilian DP professionals weekly. It covers new products and services, current applications and latest industry developments and trends.

MicroMundo is the only microcomputer publication in Brazil. Each month, 30,000 Brazilian micro and personal computer users read *MicroMundo*. The editorial keeps users up-to-date on all current news in the micro world.

CW International Marketing Services makes advertising your new products in Brazil, and around the world, easy. We have over 50 publications in more than 25 countries. For more information on our wide range of services, complete the coupon and mail today.

Only Sperry can make the following four statements.

Our PC runs the XENIX™ system, as well as MS-DOS™

Our 4 new microcomputers run the UNIX system.

Our new minicomputer runs the UNIX system.

Our Series 1100 mainframes run the UNIX system.

All of which means there is a great deal we can do for you.

For instance, our family of computers based on UNIX systems has incredible transportability for all your software.

And being able to accommodate from two to hundreds of users, it's impossible to outgrow our hardware.

Of course, this linking of all your computer systems can add measurably to your productivity.

And a fast way to find out more is to get a copy of our Sperry Information kit. For yours, or to arrange a demonstration at one of our Productivity Centers, call **1-800-547-8362 (ext. 60).**

HP offers Laser Jet Plus in high-end printer mart

vent the capacity constraints of HP's plug-in font cartridges.

The combination of improved print quality and additional performance features makes Laser Jet Plus particularly suitable for high-end commercial applications such as office typesetting, technical word processing, presentation graphics and computer-aided design and manufacturing output, Archibald said.

Laser Jet Plus runs the same software as its supplier's original model and is compatible with an assortment of both HP and non-HP microcomputers.

Shipments of the enhanced printer, which costs $3,995, start immediately.

The one-slot Colorific board works with the standard IBM color monitor. With appropriate software, the Colorific supports high-resolution display modes of 640 by 200 pixels in four-color mode and 320 by 200 pixels in 16-color mode.

The board offers 16K bytes of memory for standard graphics and text display and 32K bytes of memory for extended graphics display.

It includes an IBM Printer Adapter-compatible parallel port. The Colorific is bundled with Resicorp's PC Accelerator software, which provides drivers for the extended graphics display of Lotus Development Corp.'s 1-2-3 and Symphony and Ashton-Tate's Framework files.

The Colorific costs $275.

STB Systems, Suite 125, 601 N. Glenville, Richardson, Texas 75081.

AUXILIARY EQUIPMENT

■ Assimilation, Inc. has announced a full-function numeric keypad and input device for the Apple Computer, Inc. Macintosh.

Numeric Turbo reportedly combines a full-scale numeric keyboard with the vendor's Mac Turbo Touch track ball cursor controller to be used in place of a mouse. It attaches to either side of the main keyboard with velcro strips for both right-handed and left-handed operators.

The device is reportedly compatible with most Macintosh software, including Lotus Development Corp.'s Jazz and Microsoft Corp.'s Excel. It is also compatible for network use.

The cost of Numeric Turbo is $149.

Assimilation, 485 Alberto Way, Los Gatos, Calif. 95030.

■ Sola, a unit of General Signal, has released power conditioners for personal computers.

The Personal Computer Power Conditioner (PCPC) portable plug-in unit is said to protect personal computers, small office computers and sensitive peripheral hardware from all ac power problems except total line failure.

The unit combines voltage regulation and isolation and operates as a portable dedicated line, according to the vendor.

There are two models available. The $119 PCPC 150 handles 150 kVA (1.25A).

The PCPC 300 was designed for larger personal computers and handles 300 kVA (2.5A), according to Sola. It costs $149.

Sola, 1717 Busse Road, Elk Grove Village, Ill. 60007.

Will MMA, Tasc join forces?

behind such mainframe users groups as Share and Common.

Today, the MMA of New York — the original chapter and still the largest — sits at a crossroads.

Many of those who formed Tasc are MMA members, and although the MMA says a dual membership can be held, members of MMA chapters outside of New York may switch their allegiance to the upstart.

Were that to happen, the MMA of New York might find itself isolated, speaking only for that city's micro managers and lacking the authority that comes from sheer size of membership.

As for the vendors, they apparently are throwing their weight behind Tasc. At a recent Tasc meeting in Detroit, which drew representatives of microcomputer management from some of the nation's largest firms, Lotus Development Corp. reportedly gave attendees a preview of the new release of its 1-2-3 spreadsheet.

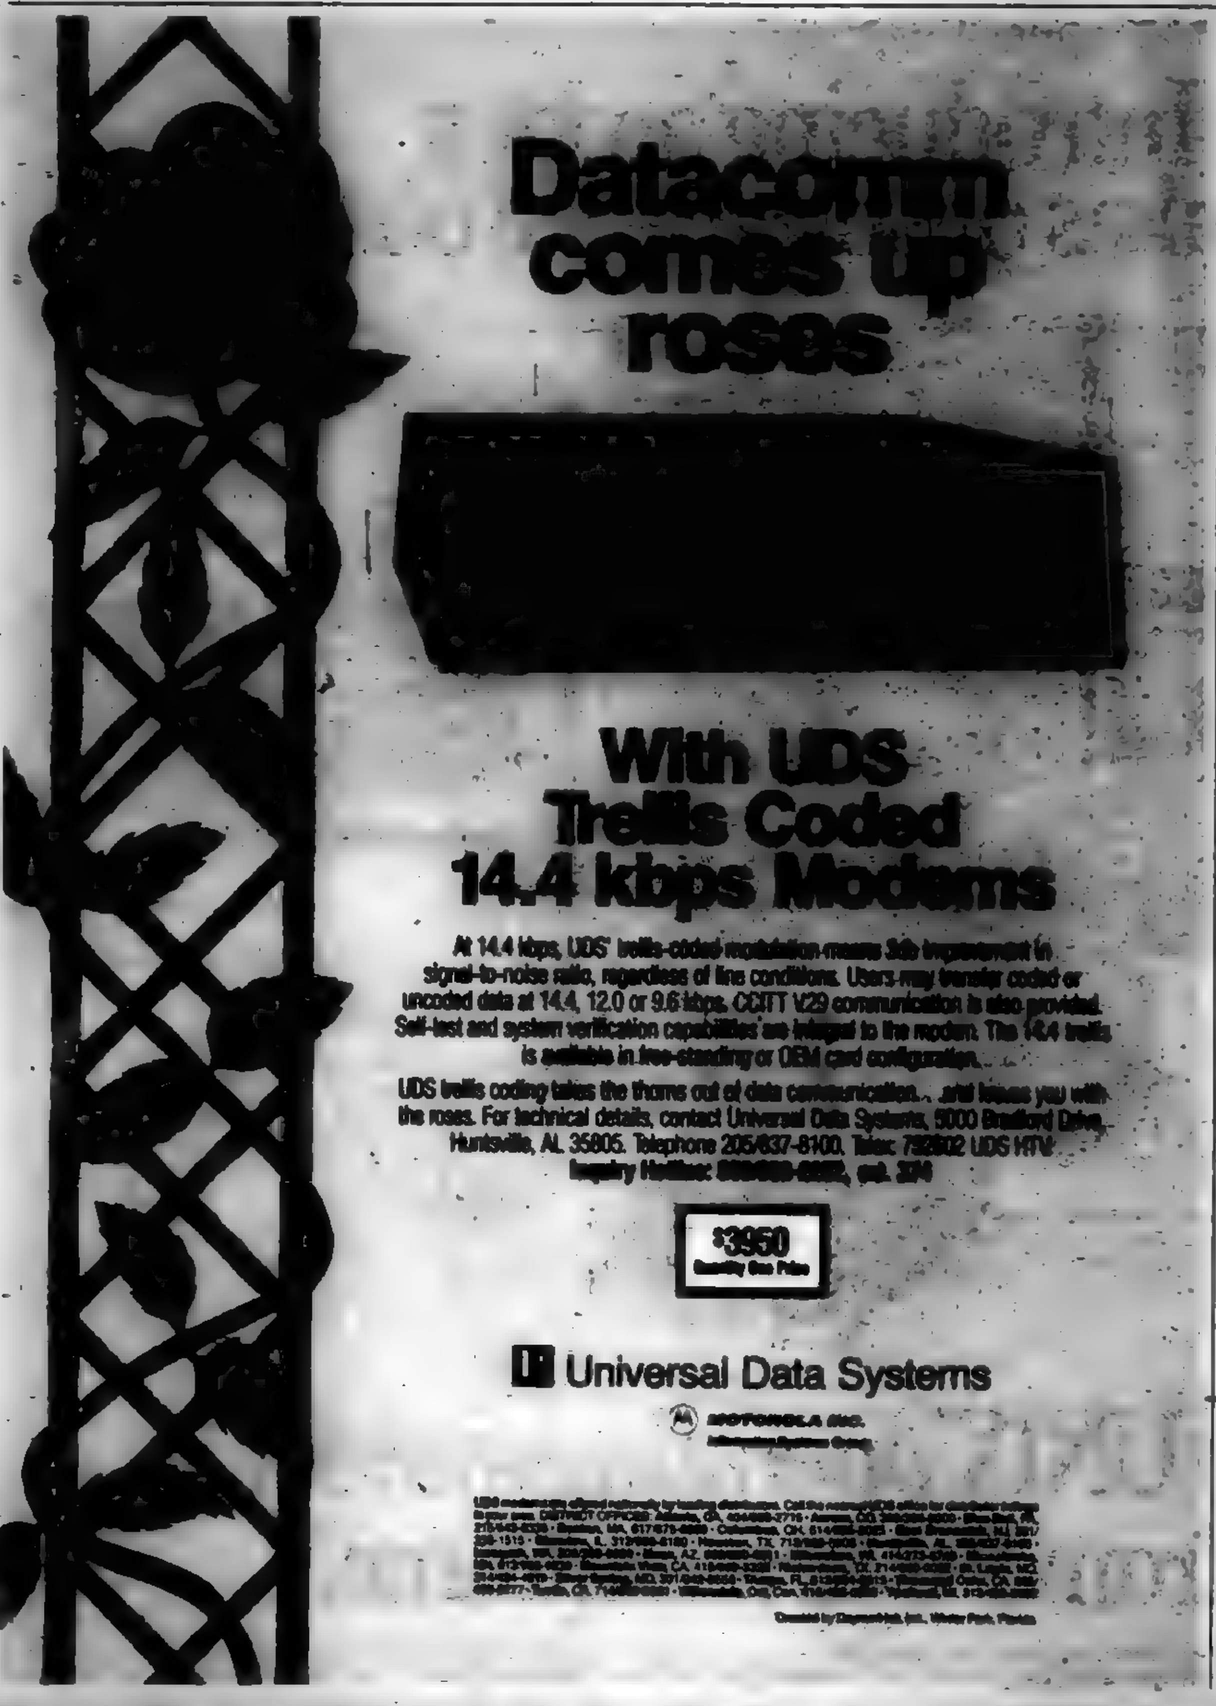
By contrast, the MMA's Gross reported just three weeks ago that he had not yet found a speaker to deliver the keynote speech at Tuesday's Microforum, the MMA's annual gathering. The MMA had hoped to get John Opel to speak, but the IBM chairman declined.

With both vendors and former or potential members joining the ranks of Tasc, the MMA is faced with a difficult situation. It could, as Gross recently suggested, become an organization that speaks for the major corporations in New York. To do so, however, would be to confine the MMA's fine sense of feistiness to one region — one that vendors could more easily ignore.

A better approach would be for the MMA of New York to become affiliated with Tasc and to speak as part of a unified voice of microcomputer managers nationwide, while retaining its name and chapter autonomy.

Such a union would give Tasc a base of members in the city that likely has the most corporate personal computer users. True, those MMA members are a contentious lot, but having a few more devil's advocates around the house can't hurt Tasc.

With the MMA at its side, Tasc could become the truly nationwide corporate personal computer users group that members of both organizations have been long awaiting.



Datacomm comes up roses
With UDS Trellis Coded 14.4 kbps Modems

At 14.4 kbps, UDS' trellis-coded modulation means 3db improvement in signal-to-noise ratio, regardless of line conditions. Users may transfer coded or uncoded data at 14.4, 12.0 or 9.6 kbps. CCITT V.29 communication is also provided. Self-test and system verification capabilities are integral to the modem. The 14.4 trellis is available in free-standing or OEM card configuration.

UDS trellis coding takes the thorns out of data communication... and leaves you with the roses. For technical details, contact Universal Data Systems, 5000 Bradford Drive, Huntsville, AL 35805. Telephone 205/837-8100. Telex 752602 UDS HTV. Inquiry Hotline: [illegible], ext. [illegible]

WEBSTAP/DANIEL MINOLI

How to choose the proper financial model

THIRD IN A THREE-PART SERIES

To do his job well, a communications manager must know how to purchase the right equipment. Financial models can help to make these decisions.

Sophisticated financial models have existed for a long time. The need for them was somewhat less evident when communications equipment was relatively inexpensive or when equipment lasted from 8 to 15 years. Today, equipment may well be obsolete by the time it is shipped and before it is installed.

In my past two columns, I presented key factors in the decision-making process. Next, I will present four techniques that for capital budgeting.

Generally, this is the best of the four methods listed. The first step involves calculating the net cash flow generated by a project. The net cash flow starts with project revenues and subtracts expenses other than depreciation, capital expenditures and taxes. Taxes are calculated by using the tax rate applied to revenues and by subtracting all project expenses, including depreciation.

The net present value is the sum of the present value of all future cash flows, minus the initial cost. A positive net present value means that the project yields a rate of return exceeding the cost of capital; a negative net present value means that a project earns less than the rate of interest from a bank.

There are two ways to use this method. In an accept-reject decision, the project is selected if the net present value is positive; the project is not undertaken if the net present value is negative.

The second method involves mutually exclusive alternatives, such as buying either modem A or modem B. If the net present values of both alternatives are positive, then select the one that has greatest net present value.

The internal rate of return method gives a rate of return on a project. If the rate of return exceeds the cost of capital, then the project is selected. If the internal rate of return does not exceed the cost of capital, then the project is not selected.

Internal rate of return can be explained by the following scenario. A manager has $1. This money, *if* put into the intended project, will earn cash at various times. If the rate is low, the project should not be accepted because a bank could easily

Firm launches E-mail micro

American Teleprocessing Corp., located in Houston, has announced a personal computer designed for users of electronic mail services.

The ATC 100 features two 360K-byte disk drives, 256K bytes of random-access memory, a monochrome monitor, communications software and an Okidata Corp. 182A printer.

The product works with communications products from MCI Communications Corp., Western Union Co. and TRT Data Products. The ATC 100 classifies and

Net management aid debuts

Monitors 512 modems

Anderson Jacobson, Inc. of San Jose, Calif., has become the latest vendor to enter the rapidly growing network management field. The company's Modem Diagnostic and Test System monitors and controls up to 512 four-wire lease-line modems.

The product supplies wraparound boxes that work with modems transmitting data at speeds between 1,200 and 14.4K bit/sec.

The system monitors 10 Electronics Industries Association leads, two analog signals and two auxiliary inputs. It also records network performance and can help to restore line problems.

Users can define operating thresholds and set alarms for conditions such as analog carrier level, the number of signals on an RS-232 interface and the presence of a streaming condition in a modem. These operating thresholds may be checked, changed and managed centrally for up to 256 modems.

The product consists of an IBM Personal Computer, system software and wraparound boxes.

Prices range from $4,195 to $14,480 for the central controller and are $895 for the wraparound boxes.

Boeing instrumental in creation of new users group

Exec sees TOP as companion protocol to GM's MAP

By Jeffry Beeler

SAN FRANCISCO — Boeing Computer Services Co. (BCS) has gained approval to take the lead in supporting an infant users group that seeks to promote communications standards for offices and factory floors.

On Aug. 20, company President Robert Dryden formally okayed a proposal for BCS to spearhead the cooperative development of the emerging Technical and Office Protocols (TOP) users group.

The announcement of Dryden's blessing came here on Aug. 26 at the annual Integrated Information Technology Conference and Exposition (Intech).

Dryden's decision will permit selected Boeing employees to take time off to serve on TOP's subcommittees and serve as liaisons between group members and standard-setting bodies, according to BCS manager Laurie Bride.

To increase the TOP users group's chances of success, BCS will bear most of the burden of shepherding the [illegible] during its critical formative stages. [illegible] of TOP, set up a TOP task force and technical review committee, and we will be the focal point for collection and dissemination of TOP information," Dryden said at Intech.

But in roughly a year, the company will gradually begin to "step back from some of its [leadership] duties and let some of TOP's other member companies start to carry the ball," Bride said.

Currently, most of the TOP organization's membership are users of the Manufacturing Automation Protocol (MAP), which General Motors Corp. developed and adopted as a standard for interconnecting incompatible factory floor devices. In other words, TOP's membership today is composed mainly of representatives from the manufacturing sector, according to Bride.

But despite its great size, the manufacturing sector by itself is probably too small to create sufficient market demand to persuade vendors to develop products that conform to TOP specifications. In the future, the TOP users group will seek to broaden its membership base beyond the manufacturing arena to include representatives of service-oriented industries like banking and insurance, Bride said.

"We [illegible] afford to ignore a demonstrated [illegible]," she said during an interview at Intech. [illegible] but we can do so in concert with a lot of other users."

Bride describes TOP as a BCS-developed "companion protocol to MAP" and envisions it as a communications standard that will do for offices what the GM interconnection scheme has already done for factories. If the BCS-led users group succeeds in diversifying its membership, TOP may someday emerge as a common protocol for exchanging information among competing vendors' office products, she said.

Both MAP and TOP conform to the first three levels of the seven-layer Open Systems Interconnect protocol. The third level, which defines the specifications for networking dissimilar equipment models, was added only recently and links devices in a MAP environment to their TOP counterparts.

"Addition of the [networking] capability was an important advance in the development of TOP because office workers need to have access to information on the factory floor" and vice versa, Bride said.

The first public demonstration of interconnected MAP and TOP environments will be jointly sponsored by GM and [illegible] this [illegible]

MEET OUR ERGONOMANIAC.

[illegible]

Long before [illegible] became fashionable in American industry, Horst Brandt [illegible] European offices.

As [illegible] of ITT [illegible] in Germany, he was among the first to take seriously the delicate relationship between man and machine.

His passion, of course, has always been workstation design that's totally human compatible. His accomplishments to date include the popular ITT 1700, 1900, and 9000 series of 3270 compatible terminals.

Tilt-swivel monitors. Amber or green on black displays. Separate function keypads. Optional lightpens. Thanks to Horst, every ITT Courier product and every idea we incorporate into our new workstation systems is ergonomically years ahead of the competition.

Maybe that's why in side-by-side comparisons, DP users and managers prefer the added humanity and productivity that's built into every ITT terminal.

For more information, contact your nearest ITT Representative. Or call the ITT Courier Sales Support Dept. toll free: (800) [illegible]

ITT
COURIER

Data acquisition units bow

Data Translation, Inc., based in Marlboro, Mass., has announced two data acquisition modules. One converts analog signals to digital with a throughput rate of 800 kHz, and a second works at speeds up to 100 kHz.

Applications for the faster product, the DT5732, include seismic/geophysical analysis, vibration analysis, radar signal processing and high-speed waveform analysis.

The DT5732 is able to make real-time analog measurements, according to Data Translation.

It consists of an input multiplexer, a separate instrumentation amplifier for each channel, sample and hold and 12-bit analog-to-digital converter, the vendor said.

Output is compatible with Digital Equipment Corp.'s Q-Bus and Multibus and the bus on the IBM Personal Computer AT.

The DT216 was designed for data acquisition systems, automatic semiconductor testing, frequency synthesis and speech analysis applications. The module contains two converters that can be changed independently and are addressed sequentially, the vendor said.

The DT216 features a proprietary deglitching circuit that eliminates glitches caused by changes to input-offset binary code.

The DT5732 costs $1,995, and the DT216 sells for $695.

Local Data converter links Ascii devices to IBM systems

Local Data, Inc., headquartered in Torrance, Calif., has announced a protocol converter that connects up to seven Ascii devices to an IBM System/34, System/36 or System/38 via its native twin-axial I/O channel.

With Interlynx/5251, Ascii terminals or printers can reportedly emulate IBM 5251 or 5291 terminals or IBM 5256 printers.

The asynchronous devices can be attached directly or remotely with modems and dial-up lines.

The product supplies a two-level password-protection scheme for dial-up users. Interlynx/5251 supplies an RS-232 interface that is switch selectable as data terminal equipment or data circuit equipment.

A parallel port supports printers from Centronics Data Computer Corp. and Datapoint Corp. at transfer rates in excess of 2,500 char./sec., according to the vendor.

The protocol converter supports transmission speeds up to 38.4K bit/sec.

Interlynx/5251 supports terminals from a number of vendors including Digital Equipment Corp., Lear Siegler, Inc., Televideo Systems, Inc. and IBM.

The product's diagnostic features include a timer that automatically restarts the unit in an unattended operation.

LEDs tell a user what station is being polled by the host and whether it is a dial-up or direct connection.

There are two models for the protocol converter. Model 1, $1,595, is nonexpandable with one serial or parallel port. Model 2 costs $1,995 and has one RS-232 port. Additional ports can be added for $550.

Bell Atlantic gets FCC nod for expansion

The Federal Communications Commission has granted Bell Atlantic Mobile Systems of Basking Ridge, N.J., permission to expand its cellular telephone service in the Delaware Valley.

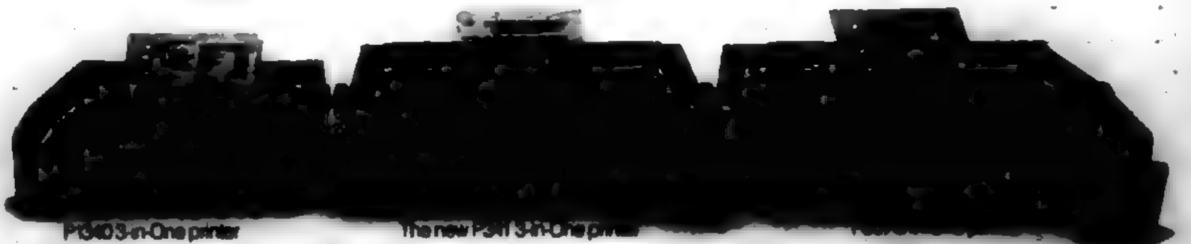
The action enables the company to increase its service area by 400 sq miles in the valley so that it covers 2,400 sq miles.

New sites will be put into operation in West Rock Hill Township, Doylestown, Phoenixville and Guthriesville in Pennsylvania and in Sicklerville, N.J.

The company estimated the cost of the project would be $2.25 million. The West Rock Hill, Doylestown and Phoenixville sites are operational. The Guthriesville site will be running in November, and the New Jersey facility will be working this month.

Bell Atlantic began offering the service in July 1984 and now serves 17 sites.

"That reminds me of the network you put in!"



LETTER PERFECT

The P351 printed this headline letter-perfectly

In this competitive business world, only letter-quality dot matrix printers are good enough for your business clients.

So it should come as good news that Toshiba now offers three letter-perfect matrix printers. Three times as many as our nearest competitor.

No matter which Toshiba your customers choose, it'll deliver: 1. Letter-quality 24-pin printing. 2. Perfectly translated graphics. 3. Speed. The three things everybody wants. Which is why they're called 3-in-One™ printers.

What's more, 3-in-One printers come with downloadable type fonts, plug-in type font cartridges, IBM-compatibility, a worldwide reputation for quality and extensive, reliable service support. Not to mention some of the highest margins in the industry.

And now, with the new P341 priced competitively between our other 3-in-One printers, Toshiba has your business clients covered. They're the customers, by the way, who will do your business the most good. So it would pay you to find out more about our three 3-in-Ones. From the perfect spokesman. Your Toshiba regional manager.

PROTOCOL CONVERTERS

■ **Wall Data, Inc. has enhanced its line of IBM 3270 and 5251 protocol converters.**

The DCF/3270 connects Ascii personal computers and terminals to IBM mainframes running 3270 Systems Network Architecture and Binary Synchronous protocols. The DCT/5251 connects Ascii devices to IBM System/34, 36 or 38 hosts.

Enhancements to the DCF/3270 and DCF/5251 enable the products to support Apple Computer, Inc.'s Macintosh's native mode, speeds of up to 19.2K bit/sec. on all ports and high-speed screen painting for personal computers and terminals.

Prices for the converters range from $3,995 to $5,995.

Wall Data, 17769 N.E. 78th Place, Redmond, Wash. 98052.

MULTIPLEXERS/ MODEMS

■ **MDB Systems, Inc. has announced a version of the Digital Equipment Corp. Q-bus DHU11 multiplexer, expandable from 32 to 256 channels.**

The product works with the DEC PDP-11/23, 11/73 and Microvax Q-bus-based systems and is compatible with DEC's RSX11 and RSTS/E operating systems.

The multiplexer's host module, the MLSI-DHU-MP, contains a 16-bit microprocessor, random-access memory files and interrupt and programmed I/O sequencers.

The module is coupled to one or more boards containing the parallel bus interconnect circuitry and 32 universal asynchronous receiver transmitters (Uarts). The Uarts convert parallel data to serial and serial to parallel for RS-232 communications with most terminals and microcomputers.

The 32-channel series with DHU11 emulation, Model MLSI-F-DHU-A32, includes the master module, one PBI-A32 board and two distribution panels with a total of 32 connectors. The price is approximately $6,500.

MDB Systems, 1995 N. Batavia St., Orange, Calif. 92665.

■ **Anderson-Jacobson, Inc. has announced the AJ 4801 modem for point-to-point or multipoint applications.**

The AJ 4801 is compatible with the CCITT V.27 standard for use over four-wire, unconditioned leased lines. The modem permits serial data transmission at 2,400 bit/sec. or 4.8K bit/sec.

The modem uses a single board and measures 2.8 in. high by 8.3 in. wide by 13.8 in. deep. The device is said to monitor and adapt to changing line conditions.

It employs digital signal processing and diagnostics, including error detection and six loop tests that can be operated centrally.

The AJ 4801 is priced at $1,495 and is available immediately.

Anderson-Jacobson, 521 Charcot Ave., San Jose, Calif. 95131.

■ **Amcom Systems, Inc. has announced a short-haul modem built inside a connector case.**

Localmodem was designed to overcome distance limitations of RS-232 connections. The modems can be used in pairs for point-to-point links and operate at speeds of up to 9.6K bit/sec. over a five-mile distance. The product can be used as either data communications equipment or as data termination equipment.

The snap-together case connects to either modular wire via a built-in RJ 11 jack or twisted pair. There are two models — one with a male connection and a second with a female connection.

Model 411 is designed for telephone company lines, employs balanced transformers to reduce crosstalk and sells for $98. Model 401 works with electronic protection circuitry and costs $76.

Amcom Systems, Suite 611, 5646 Milton St., Dallas, Texas 75206.

T-Bar introduces 19.2K bit/sec. matrix switches

T-Bar, Inc., located in Wilton, Conn., has introduced matrix switches that reportedly offer more than 17 times the nonblocked capacity of IBM's recently announced 3728 switch.

DSM Series 2001 supplies 2,048 circuits that support transmission speeds of up to 19.2K bit/sec., compared with a figure of 120 circuits for an IBM product, T-Bar claimed. The switches work with nonblocked satellite architecture, according to the vendor.

The T-Bar offering supplies up to 32,000 ports, which are compatible with various modems from AT&T and IBM, the company said.

T-Bar added that the product's control terminal can be a personal computer from AT&T, IBM, Texas Instruments, Inc. or other companies that run Microsoft Corp.'s MS-DOS operating system.

There are two versions of the product, Galaxy and Monolith. The Galaxy version supplies 2,048 ports and the Monolith version supports 320 ports.

The switches are available at an average cost of $300 to $350 per port, according to the vendor.

Our issue on Big Blue can put you in the black.

Big Blue or not Big Blue.

A decision everyone must ultimately make. And even when they choose an alternative, invariably the first question is how to connect with IBM equipment.

Our December 4th *Computerworld Extra!* will provide a number of perspectives on the situation. Which will be of critical interest to anyone dealing with IBM. And that's just about everyone.

First, we'll delve deep inside the company itself. And look at possible mergers and acquisitions, corporate structure, financial status, and the personalities involved.

Then we'll take a hard look at the company's products and strategies. We'll discuss their strengths and weaknesses. We'll look at the new hardware introductions. And explore IBM's local area networking introductions.

Finally, we'll cover the alternatives, from PCs to mainframes. And of course, the compatability issue.

And all this information will go out to our 128,000 paid subscribers. Plus the hundreds of thousands of people they pass us along to.

So if you've got a product or service that's IBM compatible — or an alternative — let IBM do your selling for you. In the December 4th *Computerworld Extra!* on IBM. But hurry, closing is October 25th.

Send in the coupon below to reserve your space today. Or call Ed Marecki, Vice President/Sales, at (617)879-0700 or your local sales representative. Call today.

☐ Please reserve space for me in the *Computerworld Extra!* on IBM.
☐ Please have a sales representative call me.
☐ Send more information on your *Computerworld Extra!* on IBM.

From page 87

How to choose the proper financial model

match a low rate. If the rate is high, then the project should be pursued, because a bank probably could not match a high rate of return.

The internal rate of return method may not be as reliable as the net present value method for two reasons. When comparing alternatives, it may not be advantageous simply to pick the alternative with the highest internal rate of return. Also, there are projects that do not yield a meaningful internal rate of return.

The payback period is the length of time it takes to recover an initial investment. When comparing two options, the one with the shorter payback period would be selected. This method is not as good as the net present value method because it does not include cash flows beyond the payback period.

The accounting rate of return, also called the return on investment, is the average annual after-tax accounting profit generated by the investment divided by the initial expense. This method is also inferior to the net present value method because it does not evaluate cash flow or take into account the cost of money.

Although these last two methods have been used prior to the general availability of computing power being arithmetically simpler, the other methods should now be used. With micro and mainframe spreadsheet packages, one has the tools to apply the appropriate methodology.

We are now going to examine two examples of purchase decisions. First, we can either buy some equipment for $2,000 or lease it for $80 for 36 months. Assuming a revenue benefit from the new equipment of $1,800 for each of three years, a cost of capital of 10%, an amortization schedule of 36 months, a salvage value of $100, a tax rate of 50% and an investment tax credit of 8%, we find with the net present value method that the buy option is better. The net present value in the purchase case is $1,262; the net present value in the lease case is $1,044. Only when the equipment cost exceeds $2,428 does the lease option become better.

In a second example, we can either buy equipment for $2,000 and have a $100 per month maintenance fee, or we can buy it for $3,000 and have a $50 per month maintenance fee. All the other factors are the same as in the first example. In this case, the $3,000 option is better because the respective net present values are $231 and $9. Only when the maintenance on the $2,000 item decreases to $84 per month does it become the better option.

From page 87

Firm launches E-mail personal computer

saves messages that are created, sent or received.

The micro supplies multitasking capabilities that enable users to edit one message while sending a second. Documents created on an IBM Personal Computer can be transferred to the ATC 100. The ATC 100 costs $2,995.

From page 87

Boeing instrumental in creation of group

also reportedly coincide with the TOP Version 1 specification.

About one month later, the TOP users group will hold its first organizational meeting in Seattle. "We want to capitalize on the enthusiasm that will be left over from the demonstration at Autofact," Bride said.

Although the TOP and MAP users groups are expected to have their own separate executive committees, the two organizations will likely rely on a common steering committee made up of representatives from 14 member corporations. "The sharing is necessary to avoid duplication of effort and to make sure that MAP and TOP remain in step with each other," Bride said.

LOCAL-AREA NETWORKS

■ Syros, Inc. has announced connectionless Internet Protocol (IP) software, a product that is said to conform to the International Standards Organization National Bureau of Standards Class 4 Transport Protocol.

The software is written in C programming language and can be ported across a variety of CPU types.

IP software costs $2,500.

Syros, P.O. Box 24477, Tempe, Ariz., 85282.

TEST EQUIPMENT

■ Atlantic Research Corp. (ARC) has announced an internal autoanswer/autodial modem for its Comstate I and Interview 40B and 30B data analyzers.

The Comstate I, Interview 40B and 30B can be programmed with a phone number to call the user when preprogrammed conditions exist, the vendor said.

Captured data and test results can then be transferred to the receiving Comstate or Interview data analyzer by remote control, according to the vendor.

The Unattended Remote feature allows control of the analyzer from an Ascii terminal or any other ARC analyzer with terminal mode over a communications circuit.

The price for the modem option is $650.

ARC, 5390 Cherokee Ave. Alexandria, Va. 22312.

WHO SAYS WORDSTAR 2000 IS SO GREAT?

"Move over MultiMate, MicroPro's back on top."
—*Business Software*

"The new package is packed with virtually dozens of features everybody wants...Even in a dedicated machine, word processing has never been more plushly self contained and comprehensive."
—*Personal Computing*

"Three early users of WordStar 2000 gave the program high marks for its overall design, mnemonic command set and intelligent use of function keys."
—*ComputerWorld*

"I've become addicted to some of the features such as undo, windows, and automatic reformatting."
—*Popular Computing*

"Include WordStar 2000 on your shopping list—it's competitive with anything now on the market."
—*Computers and Electronics*

Research, acquisitions tell Honeywell's tale

FIFTH IN A SERIES

By Tom Henkel

Like other companies that divide their attentions today between building computer systems and sophisticated electronics gear, Honeywell, Inc. made its mark on the industry partly through its own early electronics research and partly by acquiring successful computer companies.

By 1955, when Honeywell officially entered the computer business by cofounding Datamatic, Corp. in Newton, Mass., it was already a successful purveyor of electronics gear. But unlike IBM and Sperry Corp., which evolved into computer businesses largely by replacing corporate electromechanical business machines with improved electronic devices, Honeywell approached the computer industry by a less likely path.

The roots of Honeywell extend to the late 1800s and a gadget called the "damper flapper," a Rube Goldberg-like device designed by a Swiss immigrant, Albert Butz. The damper flapper's function was to manipulate the dampers on a coal-fired furnace to maintain an even room temperature and, with any luck, to keep one's home from burning to the ground due to an overly stoked furnace.

While the damper flapper itself had nothing to do with computing, it gave rise to a company that — through a somewhat circuitous route — did deal with computing. The damper flapper and its patent caused two men, Mark Honeywell and W. R. Sweatt, to merge their respective heat control companies to form the Minneapolis Honeywell Heat Regulator Co. in 1927.

Building upon the heat regulator — thermostat — business, Minneapolis Honeywell Heat Regulator branched out to manufacture various types of control systems. In 1934, Minneapolis Honeywell Heat Regulator bought out Brown Instrument Co. in Philadelphia.

Brown Instrument was one of the leading manufacturers of recording, indicating and controlling instruments. That acquisition propelled Minneapolis Honeywell Heat Regulator to a stronger dependence on electronics.

World War II bolstered Minneapolis Honeywell's interest in electronics as the company developed various instruments for the armed forces, including the C-1 electronic autopilot system.

By the early 1950s, Honeywell researchers were experimenting with Bell Laboratories transistors, a move that led to the formation of Datamatic in 1955. Datamatic was a joint effort by Raytheon Corp. and Honeywell to develop a large-scale computer system. Raytheon sold its 40% share in the company in

School district's NAS drives get high marks

Cache controllers provide IBM power at 60% of cost

By Donna Raimondi

MIAMI — The fourth largest school district in the U.S. installed one of the first National Advanced Systems, Inc. NAS 7880 disk drives with cache controllers to handle its 26G bytes of storage data. As a result, the Dade County School District is getting performance comparable to that of an IBM 3380 disk drive for 60% of the cost.

The school district serves approximately 232,000 Dade County public school students, said Management Information Systems Director Gene Brewer. The Florida legislature has mandated that all school districts transmit student information electronically to the capitol in Tallahassee by July 1, 1987. But even before the mandate, Dade's school system had been in the process of automating for seven or eight years, said Brewer.

With an annual budget of over $1 billion, $10 million of which is dedicated to MIS, the school system must track student information such as grades, attendance records, schedules and career counseling activities for grades kindergarten through 12. The district's mainframe system, a NAS 9080 processor running under IBM's MVS/SP 1.3.1 operating system, also handles all budget, financial, personnel, food services and transportation information processing for the school district.

The more than 1,500 terminal users in the state-controlled information resource network (Dade provides data processing services for school districts in two *Florida* panhandle counties, as well as for itself) have experienced response times of less than a second since adding the NAS 7880 disk drives with cache controllers, Brewer said. These response times, down from as much as 30 seconds, cannot be attributed solely to the cache controller feature because there have been upgrades to the whole system, he said.

The reason the school district is so heavily stocked with NAS equipment is purely based on price, Brewer said. When bids went out for computer equipment, NAS came in at about 60% of what comparable IBM equipment costs. The mainte-

Floating Point Systems adds MP32 series array processor

Targeting signal- and image-processing systems integrators and OEMs, Floating Point Systems, Inc. in Beaverton, Ore., has announced its MP32 series array processor.

The processor is said to perform up to 54 million floating-point operations per second. It is a multiple-instruction, multiple-data multiprocessor supporting up to three arithmetic processors and two I/O processors. Its internally shared memory can hold one million to seven million 32-bit words, with 24-bit addressing for up to 16 million words.

The company said that a Motorola, Inc. 68000-based control processor directs the flow of data and instructions through the system and that concurrent, asynchronous operation is facilitated by a control language similar to Fortran with utilities for handling parallel processing.

Memory reportedly can be addressed in arbitrary increments such as rows, columns and diagonals. There are nine slots for memory and processor options. There is also a switch-selectable formatter to perform fix and float operations and a 6M byte/sec. I/O processor transfer rate.

The MP32 was designed to be compatible with Data General Corp. and Perkin-Elmer Corp. computers used as front-end processors.

Available now, it is priced starting at $57,500.

SI clusters Microvax II

By Donna Raimondi

MILPITAS, Calif.— System Industries, Inc. (SI) has taken the wraps off a $4,000 interface to its 9900 controller that reportedly enables the Digital Equipment Corp. Microvax II to be clustered with up to eight VAX machines of any size on an SI 9900 series cluster controller.

The 9900 controller supports up to eight CPU interfaces when it has a $16,000 SI multiple access controller system added to it. The controller system is said to allow any machine on the cluster to act as I/O manager, eliminating the need for one machine to be a dedicated traffic manager.

A newly announced option for the 9900 controller — a disk cache controller — enables the most often accessed or selected data to be cached in the controller, allowing a 2-msec average access time as opposed to a 25-msec access time if the data had to go out to the disk.

The company also announced a product that is said to allow the Microvax II to access up to 2G bytes of storage in stand-alone mode or to directly access up to 5G bytes of storage data on a cluster. The company's QDA/50 disk controller system is a Q-bus disk adapter that allows all of Fujitsu Systems of America Winchester drives to run on the Microvax II. It is a DEC Storage Architecture-compatible option for DEC's PDP and VAX series machines, an SI spokesman said.

The QDA-50 is said to offer SI's Power-Pack configuration, which allows disks and tapes to be put in a single cabinet, and to offer a sub-20

Shiva unveils turnkeys said to speed circuit simulation

SX series based on Sequent system

A parallel system announced recently speeds circuit simulation of integrated circuit designs and is based on the Sequent Computer Systems Balance 8000 parallel computer with National Semiconductor Corp. 32032 chips.

Shiva Multisystems Corp., a 2-year-old Menlo Park, Calif., company that develops systems to address the computation-intensive problems in the computer-aided engineering industry, announced its SX series of turnkey systems.

The systems are said to be dedicated to electronic circuit simulation. The SX series operates under Sequent's Dynix operating system, a University of California at Berkeley 4.2 version of AT&T's Unix. Shiva's Powerspice circuit simulation software is included in the system.

The SX series is said to simulate performance of integrated circuits while running at speeds of up to 100 times faster than a Digital Equipment Corp. VAX-11/780 running the public domain Spice2 circuit simulation software developed by the University of California at Berkeley. The VAX-11/780 running Spice2 is a standard way to compare circuit simulation systems, a Shiva spokesman said.

The SX series can communicate via Ethernet using the TCP/IP protocol with DEC's VAX series computers running under the AT&T Unix or DEC VMS operating systems; with IBM or plug-compatibles running VM; and with AT&T Unix-based workstations, including those from Apollo Computer, Inc., Masscomp and Sun Microsystems, Inc.

Shiva plans to mix the 32032 chips with its own accelerator processors into the configuration needed to reach certain performance levels at the prices listed below.

Models include the SX-250, which is projected to have two National Semi 32032 processors and two Shiva accelerator processors. This model is said to offer 20 times the performance of a DEC VAX-11/780 running Spice2, and it costs $125,000.

The SX-1000 will most likely have six 32032s and six accelerators. It is said to offer 50 times the VAX-11/780's performance at a price of $240,000. The top-of-the-line SX-2000 costs $350,000 and will contain between eight and 12 processors and the same number of accelerators. This model is said to offer 100 times the VAX's performance.

All units will ship in October.

Study eyes optical disks

Optical disk systems will represent almost one-quarter of the value of automated document storage equipment shipments by the end of the decade, according to a study by Venture Development Corp., a management consulting firm based in Natick, Mass.

The study examined the market for image storage equipment in the U.S. and noted that the $400 million to $500 million annual market for conventional document storage and retrieval equipment, including micrographics and COM, has grown only gradually in recent years.

But the report, "Micrographics and Optical Digital Disk Systems 1985-1990," added that the market for optical digital disk systems has moved from a few test sites in 1984 to commercial shipments of $6 million for 1985. By 1990, annual shipments will be worth $160 million, the report said.

Venture Development noted that while the $160 million figure is below the estimates of some industry observers, optical systems will still represent an important market.

The report cited three prime areas of concern in relation to optical technology. It said the six-figure price tag for a complete optical disk system increases the importance of cost justification. It noted that the useful life of images stored on optical disk remains a question while microfilm images made 100 years ago are still usable today. And, it observed that if courts do not accept optical disks as legal evidence then COM backup of optical systems will be necessary for some applications.

However, the report forecast that by 1990 optical digital disk systems will represent 24.4% of the automated document storage and retrieval equipment shipments, vaulting that technology from the point of having no market share in 1984 into second place in the market behind standalone micrographics systems.

The 140-page report costs $2,970.

PROCESSORS

■ **Computervision Corp. has unwrapped a file server for engineering project management and resource sharing.**

The CDS 3701-E file server is part of Computervision's CDS 3000 family of workstations. The file server acts as a resource node on an Ethernet TCP/IP network, the vendor said. The basic unit includes a dual Motorola, Inc. 68000 central processing unit, 2M bytes of main memory, a 33M-byte 5¼-in. hard disk drive, the C programming language and AT&T's Unix 4.2 BSD operating system. That system costs from $25,900.

THE WORKSTATION THAT PIGGYBACKS ON THE PC.

Everyone knows the PC is a powerful tool. What everyone doesn't know is that many office workers who use personal computers spend *less than an hour a day* actually working on them. Which makes it next to impossible to cost-justify an individual PC for everyone in your company.

That's where Davox comes in. Davox takes the power of the IBM PC and allows that power to be shared by multiple users. With Davox workstations, a number of users (typically 4 or 5) spread throughout a network can access and utilize the full computing capabilities of a single PC. At a fraction of the cost to your company of going out and buying PCs for everyone.

But that's just the first reason for going with Davox. Davox integrated voice/data workstations let you access your IBM mainframe, DEC mini's, dial-up databases or IBM PC's. And Davox's 16 "Smart Buttons" let you access these different computer resources with a single keystroke. You can even dial a phone number directly from the screen with a single keystroke. And DavoxNet's twisted-pair telephone wire networking design eliminates expensive coaxial wiring.

To find out more, call Mike Giltner at (617) 667-4455 or toll-free at 1-800-343-1152. Or mail in the coupon below.

DAVOX™

We *are* data and voice systems.
We do it all. And we do it now.

☐ Yes! I'd like to find out how to piggyback on a PC.

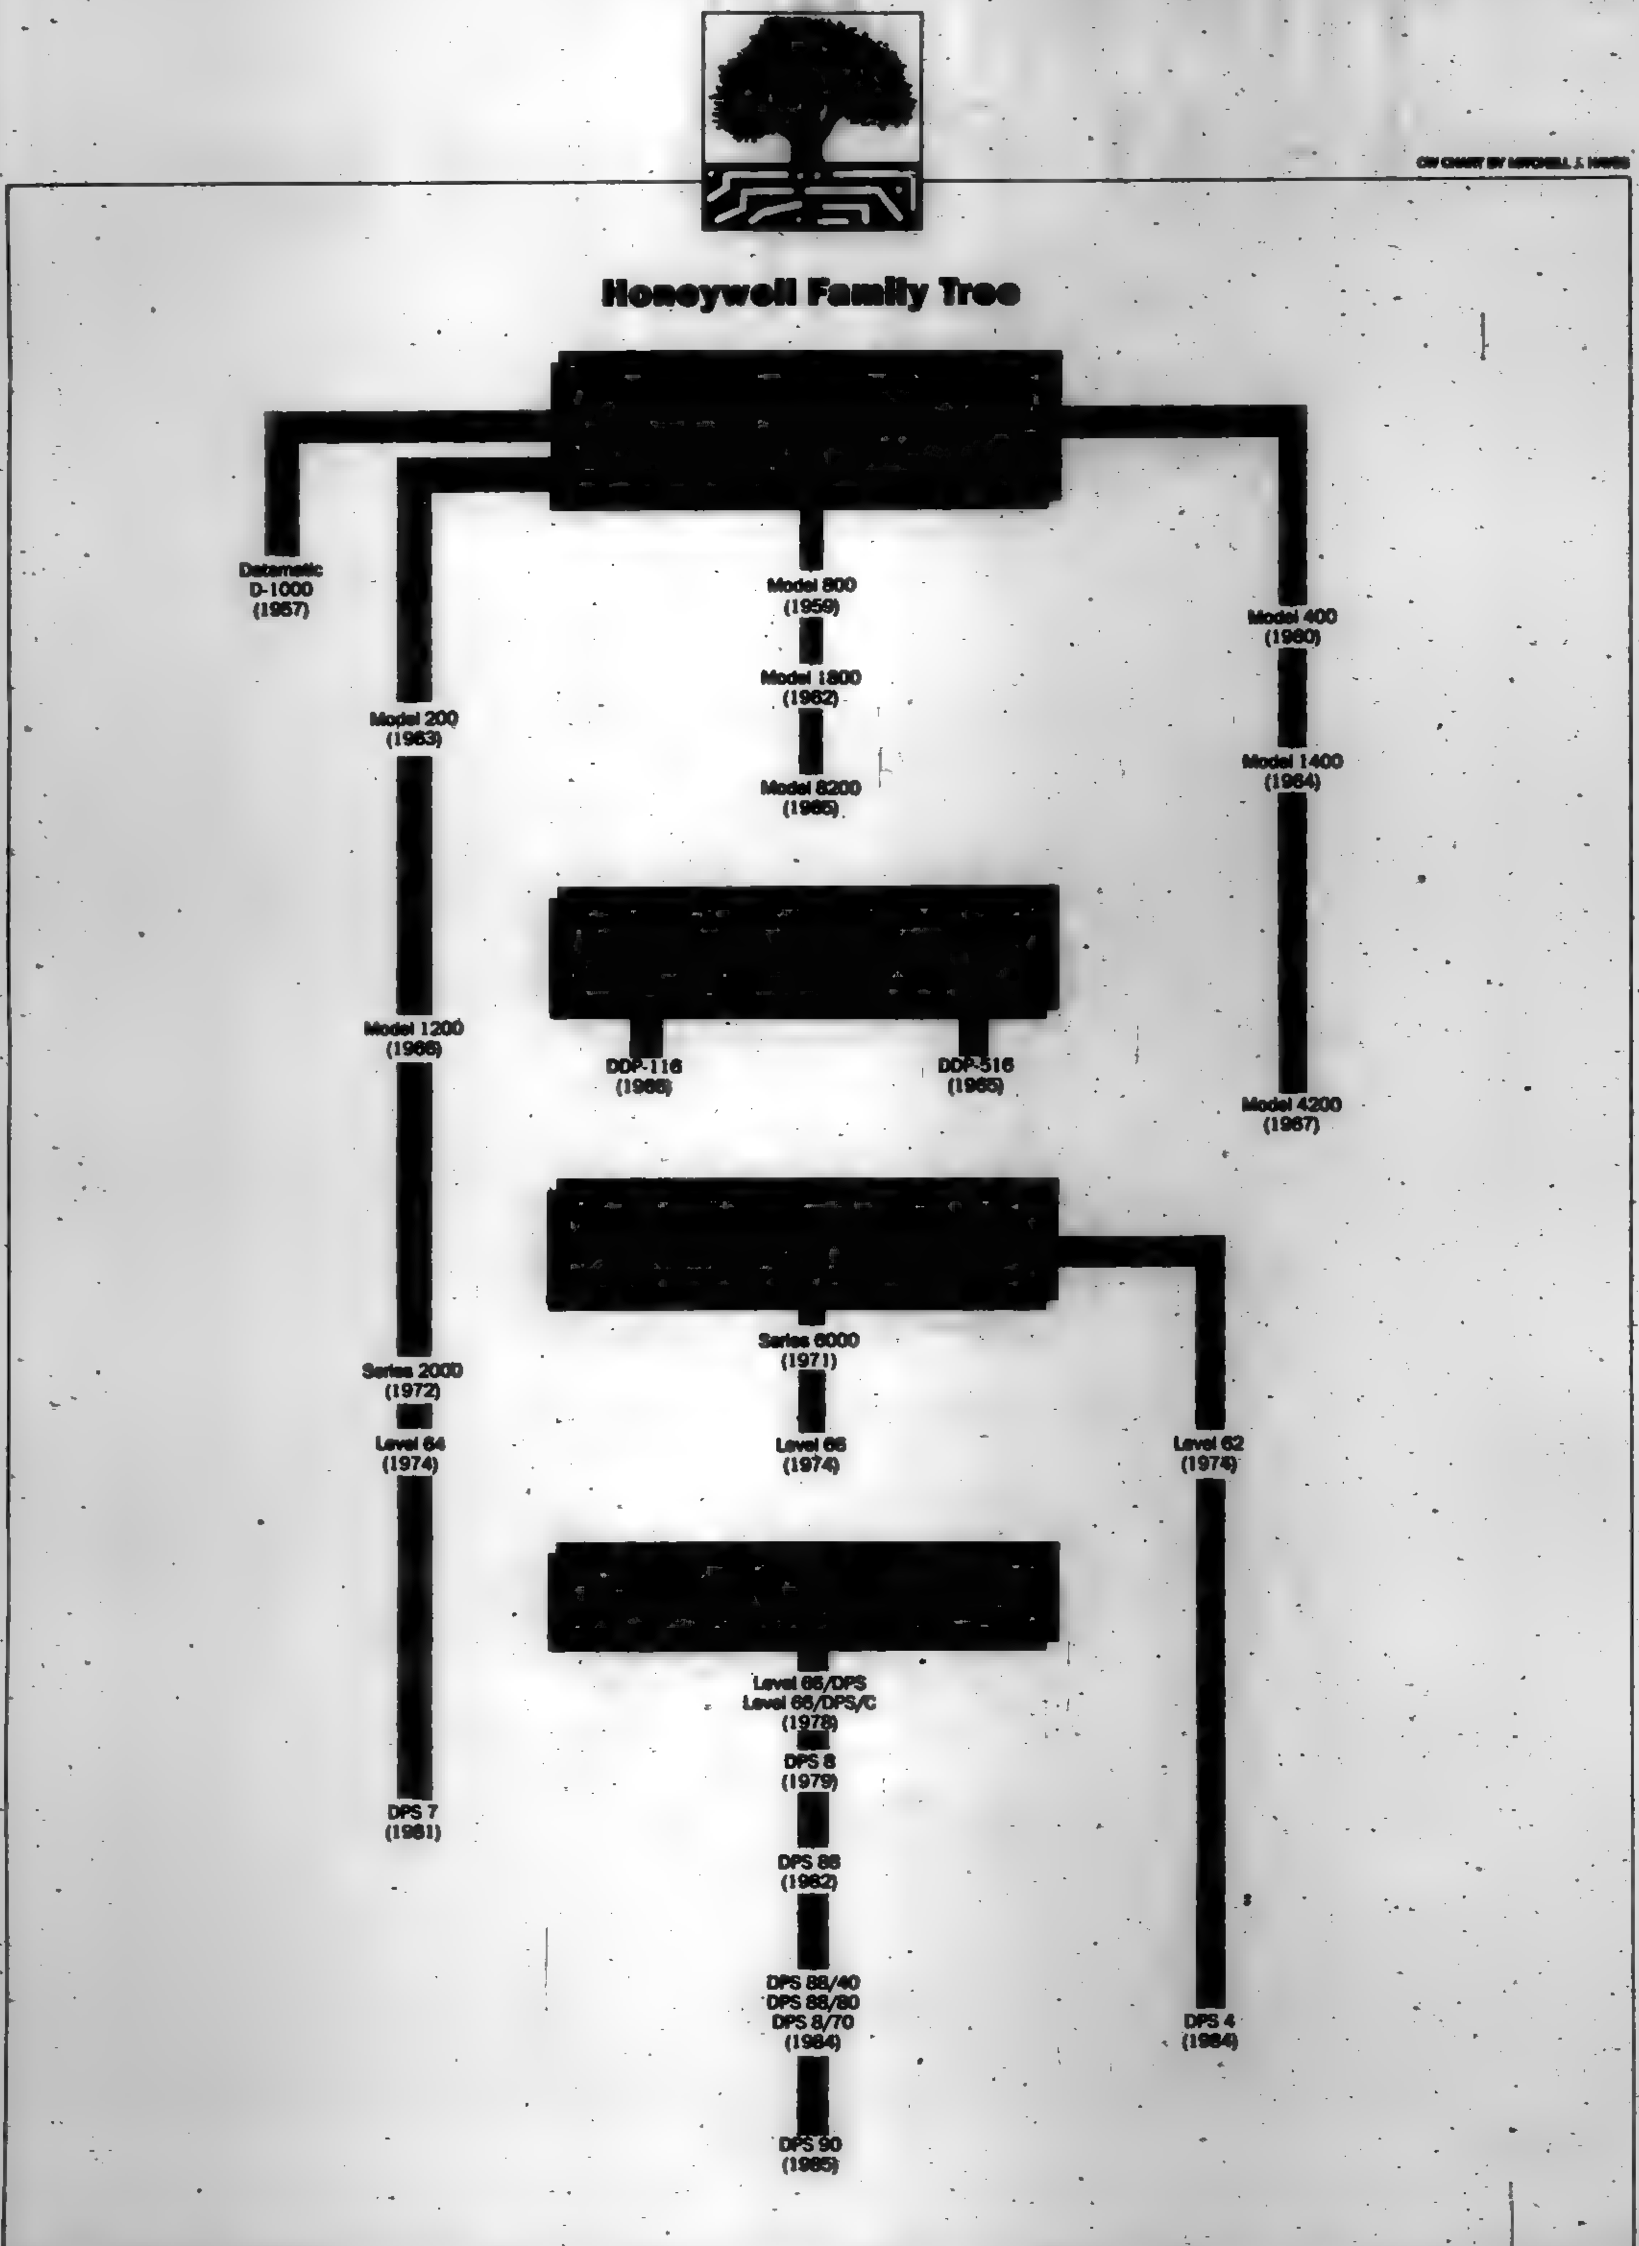
Honeywell Family Tree



CW CHART BY MITCHELL J. HAYES

From page 95

Research, acquisitions tell Honeywell's tale

1957, and Datamatic became a division of Honeywell.

The Datamatic Division produced its first system, the D-1000 in 1957, which was installed by Blue Cross and Blue Shield of Michigan. About 14 of the vacuum tube D-1000 units were installed, recalled George Olsen, now a director of quality management for Honeywell.

The D-1000 gave way to the Model 800 processor in 1959, which was superseded by the 1800 model in 1962. Also in 1962, Honeywell unveiled the Model 400, which used an innovative snake logic switch patented by a young researcher at MIT.

That researcher, Ken Olsen, was the founder and chief executive officer of Digital Equipment Corp. The Model 400 was an attempt to compete with IBM's 1400 series of processors, noted Honeywell's George Olsen.

The Model 400 was superseded in 1965 by the Model 200, which Honeywell's Olsen claims was five times more powerful than IBM's 1401.

In 1966, Honeywell acquired another company, Computer Control Co. of Framingham, Mass., which added two small 16-bit minicomputers to the Honeywell lineup — the DDP-116 in 1966 and the Series 1640 in 1970.

But by far, the most significant turn of events that propelled Honeywell into the mainframe business was the acquisition of General Electric Corp.'s failing computer business in 1970.

Honeywell called the deal a "partial purchase-partial pooling," whereby both Honeywell and GE would contribute to the formation of a new firm. The firm became Honeywell Information Services. Honeywell owned 81.5% of the company, and GE owned 18.5%.

To gain such a commanding role in the new company, Honeywell agreed to give GE 1.5 million shares of stock and $110 million in notes, interest free, for the first year. The merger led to the acquisition of Series 60 and Series 6000 processors, which have been enhanced into what is the firm's current product lineup.

In 1976, Honeywell acquired an interest in another failing computer company — Xerox Data Systems. Honeywell agreed to assume marketing, support and maintenance for the Xerox Sigma line of mainframes. Honeywell eventually developed a migration path to allow Sigma users to move to Honeywell mainframes.

> ❞
>
> *But by far, the most significant turn of events that propelled Honeywell into the mainframe business was the acquisition of General Electric Corp.'s failing computer business in 1970.*

That same year, Honeywell introduced its Level 6 line, which it considered a major thrust into the minicomputer business.

The company began emphasizing distributed processing in 1977 with the announcement of its Distributed Systems Environment and an extension of that environment to the Level 68/Distributed Processing System (DPS) and the integration of host and satellite functionality with multifunctional Level 6 Gcos software.

Four large-scale computers, the DPS 8 line, and the Gcos 8 operating system were added in 1979, followed by a family of small, distributed processing systems, the DPS 6 and various word processing and administration systems a year later, marking Honeywell's entry into the office automation market.

The DPS 7, a family of medium-scale systems using current-mode logic technology, was introduced in 1981. The same year, Honeywell acquired Action Communication Systems, Inc., a tandem switching and private voice network vendor, and renamed it the Communications Networks Division.

A new line of large systems, the DPS 88 family, was announced in 1982, but Honeywell shifted its attention to small systems in 1983 with the introduction of its first microcomputer, the Microsystem 6/10.

In 1984 Honeywell added to its DPS 88 series and signed a technology agreement calling for Honeywell to use NCR Corp.'s 32-bit very large-scale integrated processor chips in developing a future computer.

Earlier this year, the company added a high-end system, the DPS 90, designed to serve the commercial, engineering and scientific communities as the central system in large distributed networks.

"Fortunately, this is a problem that can be solved by throwing money at it."

CIM: The future of factory management, automation

By Warren Hinze
Special to CW

Computer-integrated manufacturing (CIM), the blueprint for the future of factory management and automation, is an informational model of the manufacturing business.

To understand CIM, MIS managers must approach it from both the information side and the business applications side.

Two models — one for each side — provide some guidance.

Applications model

This model is composed of nine elements:

- Business planning.
- Resource planning.
- Resource scheduling.
- Demand management.
- Distribution management.
- Factory automation.
- Measurement and control systems.
- Configuration management.
- Financial management.

Together, these elements compose a comprehensive view of the business of factory management and automation.

Business planning encompasses the areas of market and financial planning. It uses modeling, simulations and fourth-generation computer languages to provide managers with the information they need. These tools promote the development of a feasible business plan.

Resource planning concerns plans for materials, manpower, machines and tooling. These resources must be present if an organization is to execute the business plan its managers have created.

Resource scheduling makes priorities for the consumption of resources. It addresses such questions as "What materials should the purchasing department buy next?" and "Which product should manufacturing produce next?"

Demand management encompasses three key elements: sales forecasting, customer order entry and sales tracking and analysis. Based on these, demand management provides business planners with the data they need to analyze the effects that actual and projected customer activity have had or will have on business.

Distribution management is concerned with distribution requirements planning (DRP) and transportation management.

DRP manages the movement of inventory from the factory, through the distribution system, to the customer. It also manages inventory within the distribution system, ensuring that excess inventory is properly redistributed.

Transportation management cannot be entirely separated from distribution management because the mode of transportation a firm uses affects the nature of the distribution system. Cost trade-offs between various modes of transportation, for example, determine the sizes and locations of a firm's warehouses.

Factory automation captures the imagination of many senior managers, who envision robots (serviced by automated materials handling equipment) effortlessly producing quality products at the lowest possible cost. But without business plans that are incorporated through CIM, those robots effortlessly produce high-quality, low-cost parts that no one wants.

Measurement and control systems collect data from manufacturing machines and analyse those machines' performances. The data acquisition process is beneficial because it tells managers what has happened. The analyses, however, provide the real payback: They show the effects the past is likely to have on the future. Because CIM is based in business planning, it provides the outline for the future against which managers can analyse the past.

Configuration management defines — through a series of steps — what a manufacturer will produce.

First, engineers use computer-aided design tools to define a product. Then manufacturing management transforms that data into bills of material, and computer-aided manufacturing tools transform the design into instructions for machine tools. Process planning software then identifies each work center machine cell or assembly area that will be required for the production of the product, and manufacturing resource planning systems identify actual materials and processes.

Each of these areas must be controlled to ensure that the products the engineers designed actually got produced and delivered, and configuration management within CIM provides the necessary control.

Financial management under CIM will make use of tools that analyze production performance against future plans. This will allow for more timely analysis than current practices allow.

Most companies today analyze production against financial actuals. In well-run companies, where books are closed within five days after a month's end, data is an average of 17 days out of date. In contrast, analysis

Hinze is vice-president for systems planning at Comserv Corp., an Eagan, Minn.-based supplier of manufacturing software and services.

The Powerhouse continues on the cutting edge of high performance computers.

The most powerful line of computer systems made. Gould PowerNodes™ and CONCEPT/32s®.

Any way you slice it they beat the VAX.™

Our mainframe PN9000 and CONCEPT 32/97 are up to twice as fast as the VAX 8600.

And even though the mid-range PN6000 and CONCEPT 32/67 are 30-50% smaller than the VAX 11/780, they're still up to three times more powerful.

More power for a slice of the price.

Despite their superior power, our mid-range models cost 40% less than the VAX 11/780. Our mainframes cost about 30% less than the new VAX 8600. The bottom line is more power for less money.

Operating environments that are a cut above the rest.

There's also a choice of system software to consider. Gould's unique UTX/32® is the first operating system to combine UNIX™ System V with Berkeley BSD 4.2. So it allows you to access virtually any command format you want whenever you want.

And in real-time environments, Gould's MPX/32™ operating system offers performance that's unmatched in the industry, as well.

Delivery that's right on the mark.

Unlike the VAX 8600, that has up to a 12 month wait for delivery, when you order either a Gould PowerNode or a CONCEPT/32 system, they'll be shipped within 90 days ARO.

You can also be sure with Gould you're getting a computer that's backed by years of experience – the kind of experience we used to develop the first 32-bit real-time computer.

If you need more information or just have a few questions, give us a call at 1-800-327-9716.

See for yourself why VAX no longer cuts it. Go with a Gould computer and ax the VAX.

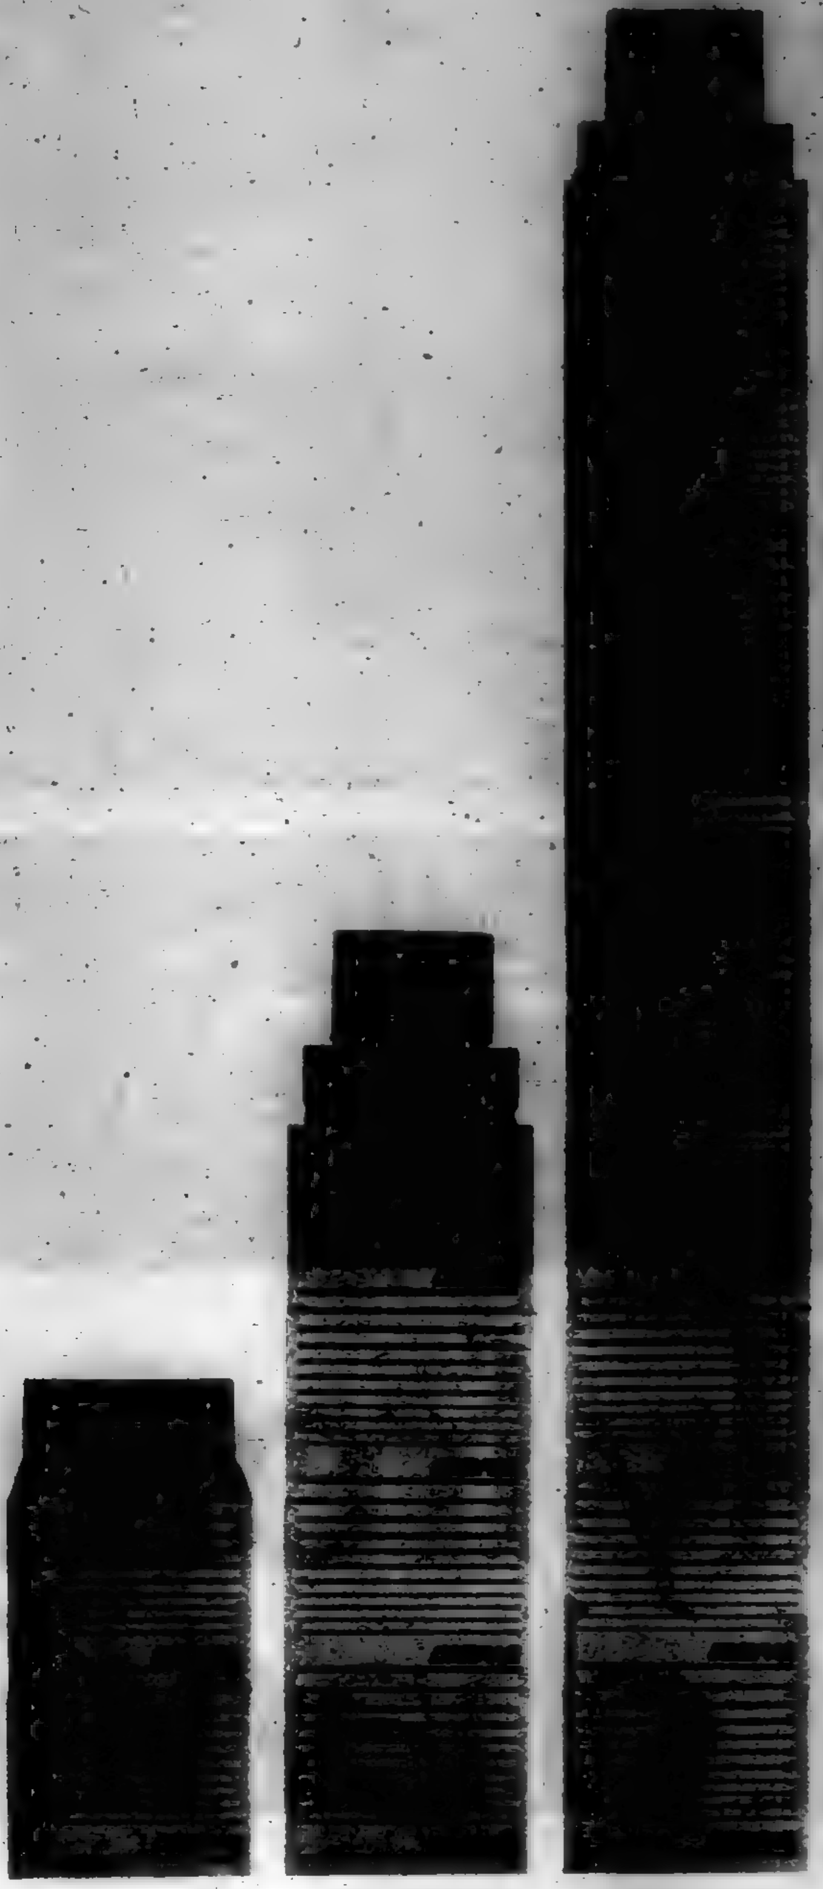
GOULD
Electronics

It's not that COMPAQ is the fastest growing computer company in the world...



It's why.

In 1983, COMPAQ® Computer Corporation had the most successful first year in the history of American business. Last year, our sales grew over 196%, making COMPAQ the world's fastest growing computer company.* And this year we're setting more records.

The reason is simple. Our computers simply work better.

For example: Most manufacturers mount disk drives in a rigid manner that could destroy data if the computer is bumped, but COMPAQ protects all disk drives (and their data) with shock mounts. Not just in our portables, but in our desktops, too.

We probably don't have to go to these lengths. But we do. In every detail.

Our exclusive internal tape back-up system can protect Megabytes of data in minutes instead of hours.

Our computers can run the world's largest library of business software.

And now our two newest products, the COMPAQ PORTABLE 286™ and COMPAQ DESKPRO 286,™ offer more speed, more storage, and more memory than ever.

Our refusal to compromise is why COMPAQ computers are rated so highly by industry trade publications and over 300,000 satisfied users.

Visit an Authorized COMPAQ Dealer near you and you'll see what has become apparent to buyers all over the world: COMPAQ computers simply work better.

For a free brochure or the location of your nearest Authorized Dealer, call toll-free 1-800-231-0900 (in Canada 416-449-8741) and ask for operator 8.

©1985 COMPAQ Computer Corporation. All rights reserved.

**Source: Datamation Magazine, June 1, 1985.*

INTRODUCING THE NET/ONE IBM MAINFRAME CONNECTION.

Our new NIU-74 and NIU-78 Network Interface Units are the link you've been waiting for between your IBM® Information System and the Net/One® local area network. Now you can switch applications without switching terminals or chairs. You can move people without the costly hassle of recabling and reconfiguring systems.

In multi-system installations, you can get more applications out to more users with fewer terminals and printers, without adding more remote controllers. The NIU 74/78's port rotoring capability lets one IBM 3274 serve more devices. And you'll get locally-attached performance even for devices miles away on large broadband systems.

The connections are made from your IBM 3274 controllers to Net/One through the NIU-74s, and from IBM 3270 type devices through the NIU-78s. The devices are plugged in, using standard connections, a standard Net/One CONFIGURE program is run to define the logical network, and you're on your way. From any terminal on the network, to any mainframe, any controller, any application.

And since Net/One is vendor-independent and supports all major LAN technologies and standards, it's the one network broad enough in scope to handle virtually every connection in your plans.

You get the additional capability you're looking for, without compromising your existing system in any way. In fact, Net/One enhances the value of the investment you have in your existing system.

Both NIU-74 and NIU-78 are available now. And, like any Net/One product, they come with continuing support from our experienced field service personnel. Give us a call, and let us help you get going host to host without going from terminal to terminal. Ungermann-Bass, Inc., 2560 Mission College Blvd., Santa Clara, CA 95050, (408) 496-0111.

DFM aids manufacturing priorities in design cycle

**By Henry W. Stoll
and Joanne H. Cole
Special to CW**

One of the most significant changes that has resulted from the computer revolution is the redefinition and evaluation of many job requirements into terms that a computer can understand.

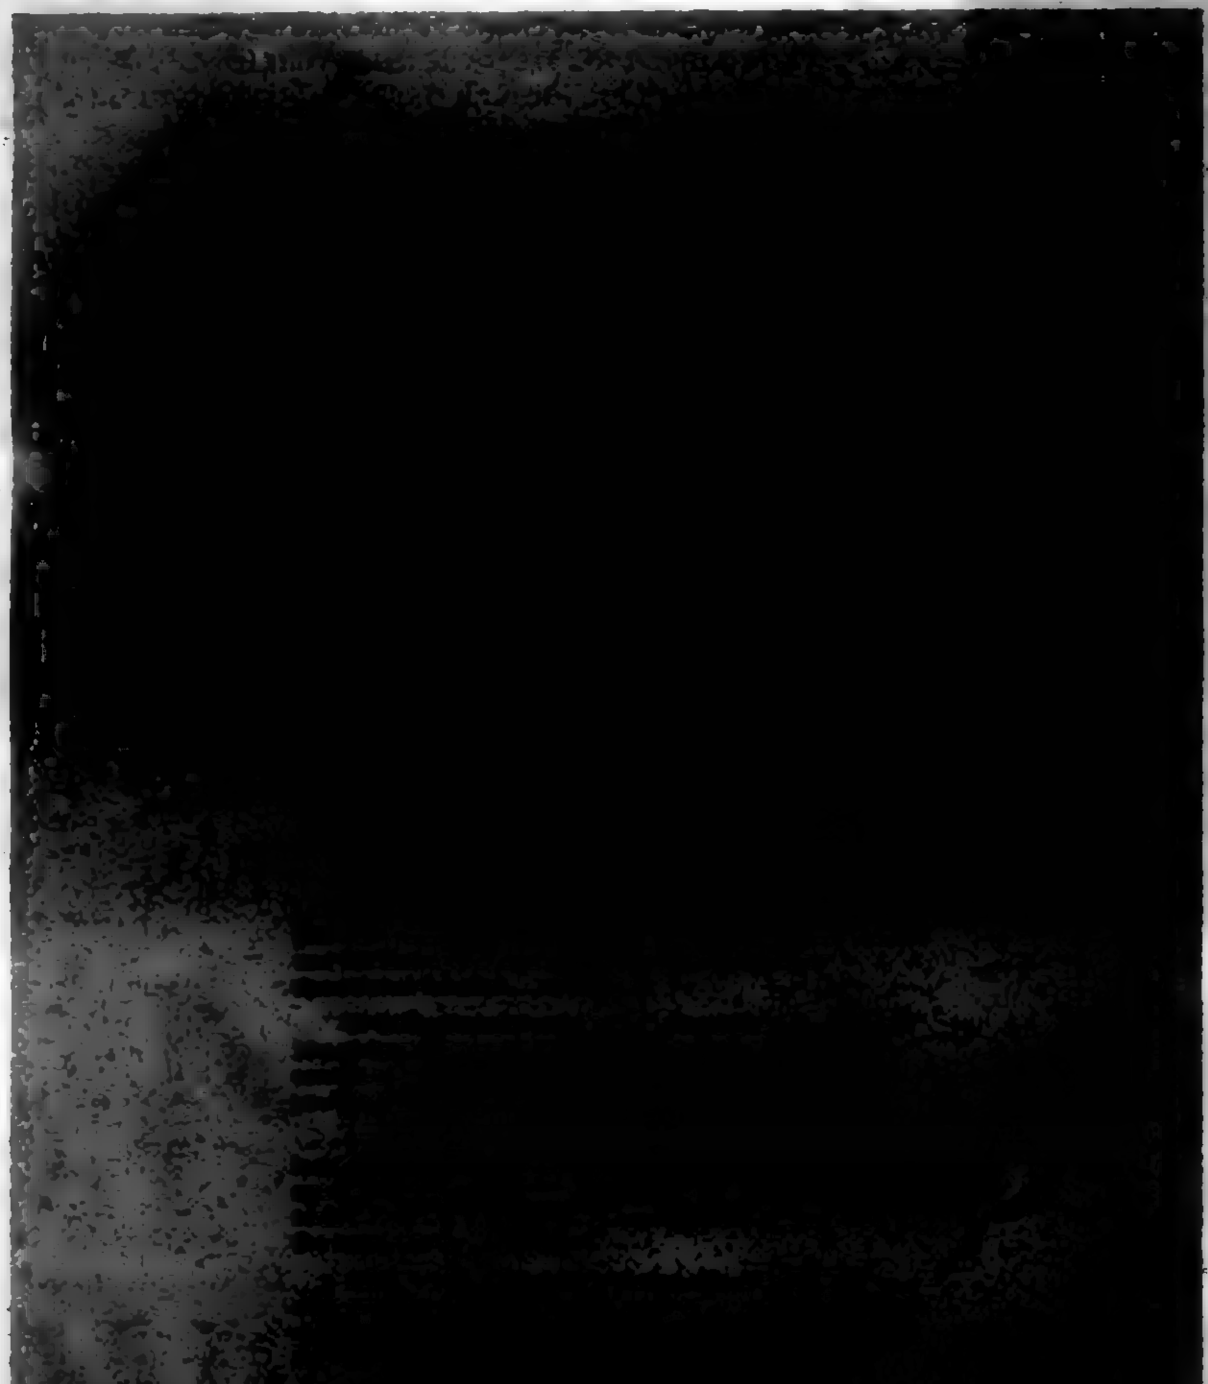
In the manufacturing environment, computerized systems are actively being used in many areas. Plant operations changes have been pervasive and well publicized. Manufacturing techniques include Kanban (just-in-time) inventory control systems, modeling and simulation of operations and assembly operations, direct computer links between user and supplier, automated material handling, statistical process control and flexible machining and assembly.

Less publicized have been the advances in product design. Design engineers now use computers extensively as engineering aids. Computer-aided design and engineering, finite element modeling, dynamic simulation and solid modeling are glamorous computer applications currently being used.

Not quite so well known is the engineering concept of design for manufacture (DFM). This concept ensures that manufacturing considerations enter early into a product's design cycle. Products designed under DFM guidelines have highly standardized components, and all unnecessary, difficult-to-manufacture features are eliminated.

The DFM concept emerged from early attempts to automate simple, manual assembly tasks. Engineers found that when people performed simple assembly tasks, they were able to compensate for problems with tools or with parts they were assembling. Machines could not perform many of these operations until the material and process problems were corrected.

Management realized that many of the problems with human assembly operations occurred when nonstandard parts or operations were required. DFM minimizes these nonstandard components and operations within the manufacturing and assembly process.



Consider manufacturing early

DFM stresses that seemingly insignificant decisions made during the initial design phase will affect manufacturing throughout the product's life cycle. Most products can be designed for easy manufacture and assembly if manufacturing is considered early in the design process. The DFM concept seeks the following goals:

- To choose product design concepts that are inherently easy to manufacture.
- To choose component designs for ease of manufacture and assembly.
- To integrate manufacturing process design with product design to assure manufacturing process capability.
- To eliminate component or assembly features that disrupt the smooth flow of production.
- To add component or assembly recognition or fixturing features to aid manufacture and assembly.
- To maximize simplicity in components and operations.
- To maximize design commonality among similar products and differentiate among products as late in production as possible.
- To match the production system to the product in an optimal way.

Several important techniques are becoming available to provide assistance in DFM. A numeric system for rating the assembly efficiency of a product design was developed in 1983 by Geoffrey Boothroyd and Peter Dewhurst, professors at the University of Massachusetts, Amherst, Mass.

This system, based on time studies of assembly operations, rates an assembly based upon the number and configurations of component parts required. It is available in both handbook and computer software versions. The system can also be used to identify the appropriate assembly operation (such as manual, flexible automation, hard automation and others) based upon expected production volumes and company investment criteria.

Many consulting companies have also recognized the importance of DFM and are now providing assistance in this area.

A number of companies have successfully implemented DFM programs. DFM techniques resulted in significant design changes for the Apple Computer, Inc. Macintosh, Sony Corp. Walkman, Hewlett-Packard Co. 9000 line of desktops, and Whirlpool Corp. and General Electric Co. appliances. Although these companies are very large and produce high volumes of assemblies in highly automated facilities, the principles and benefits of DFM do not depend on

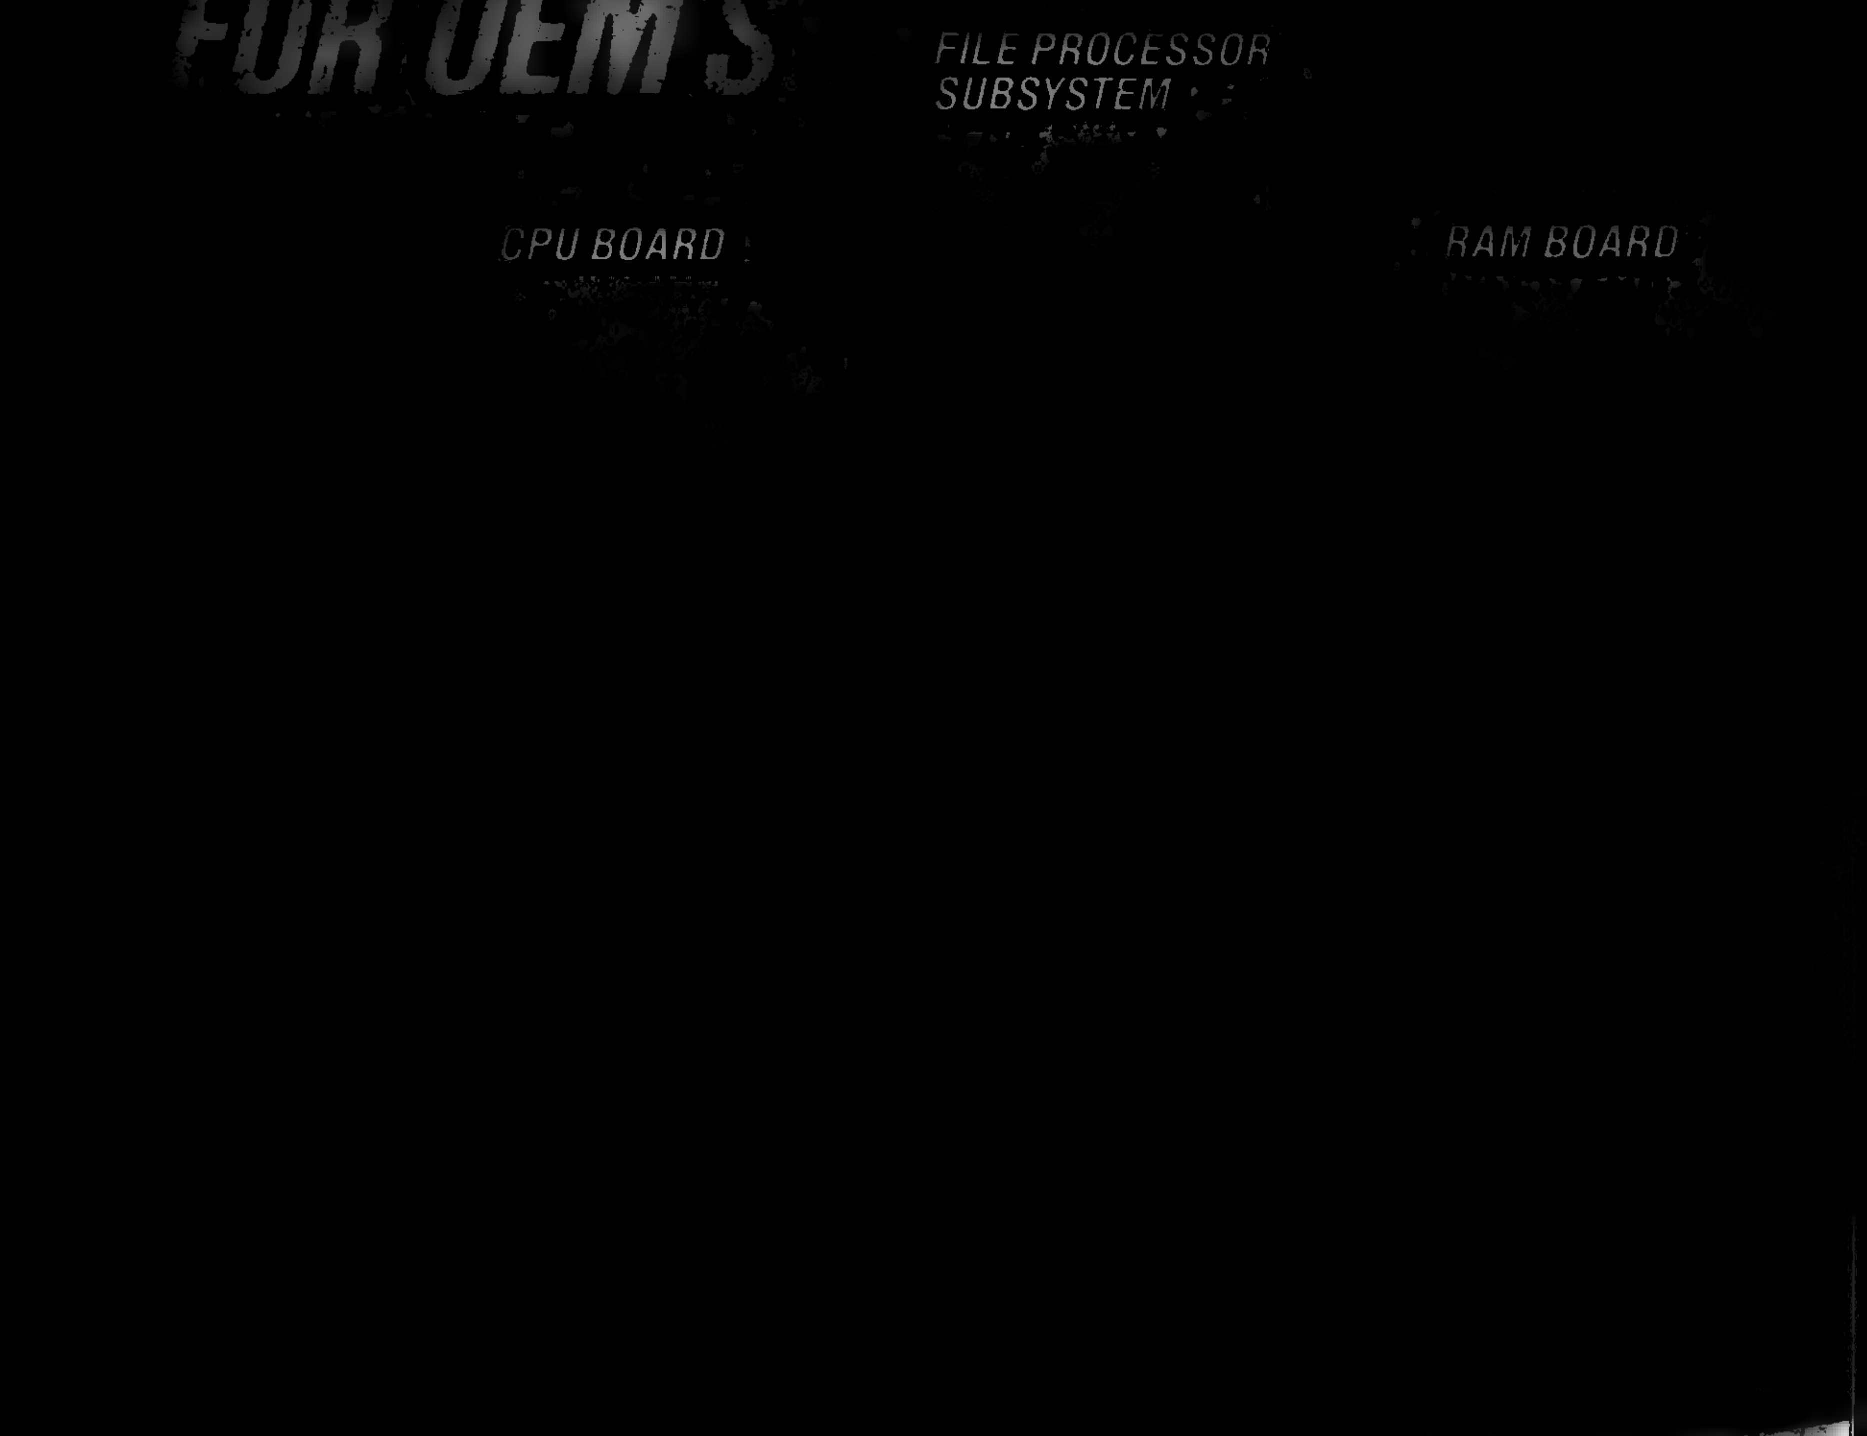
THE ALTOS 3068: SIX BREAKTHROUGHS [illegible] FOR OEM'S



BREAKTHROUGH PRICE/PERFORMANCE

Combining the 32-bit MC68020, multiple auxiliary processors, and a tuned version of UNIX™ System V, the 30-user 3068 "is capable of a performance that rivals large mini-computers." (Computerworld, April 1985). And it does it for a micro computer price—from $7,900 for OEM quantities.

BREAKTHROUGH MODULARITY

"Using plug-in boards the way a personal computer does really sets Altos apart" (research firm Creative Strategies, Computerworld, April 1985). OEM's can choose from a wide range of modules: 10 to 40 serial ports; 1 to 16 MB of memory; 17 to 280 MB (formatted) hard disk storage.

BREAKTHROUGH HARDWARE DESIGN

"Altos is way ahead of everybody else." (Creative Strategies, Computerworld, April 1985): high speed [illegible] CPU speed, with no wait-states; cache [illegible] processors. [illegible]

[illegible]

BREAKTHROUGH UNIX™ SUPPORT

To meet the most rigorous applications requirements, the 3068 incorporates demand paged virtual memory, record locking, and sophisticated interprocess communication. An optimizing C-compiler, symbolic debugger, and a full set of development tools and languages form a complete development environment. Productivity tools include an integrated package of word processing, spreadsheet, DBMS, graphics, and electronic mail.

UNIX is a trademark of Bell Labs

BREAKTHROUGH COMMUNICATIONS AND NETWORKING

With a variety of protocols and the Altos Worknet™ LAN, 3068 communications span PC's to mainframes. The standard communications board has 10 serial ports, an on-board micro-processor, and up to 128 KB of RAM. The system can be configured with up to four communications boards.

BREAKTHROUGH DIAGNOSTICS

Remote diagnostics minimize downtime by isolating problems to an easily exchanged Field Replaceable Unit.

Get a step ahead of your competition. Put our innovative supermicro engineering to work on your application.

In hardware, software, communications, service, and reliability, Altos has a breakthrough for you.

Continued from page 96

A typical configuration includes an enhanced CPU that is said to offer twice the performance of the basic unit, 2M bytes of main memory, a 32M-byte hard disk, a 1M-byte floppy disk, an Ethernet controller, six RS-232 I/O ports and one Versatec, Inc. I/O port. The typical configuration costs $41,700.

Computervision, 15 Crosby Drive, Bedford, Mass. 01730.

DATA STORAGE

■ Wilson Laboratories, Inc. has unwrapped a disk drive analyzer that is said to test up to four Winchester-type drives in sequence.

The Digital Analog Test System-2000 (Data-2000) analyzer incorporates analog testing for missing pulse, extra pulse, phase margin, amplitude and resolution. Digital analyses verify media defects, measure read window margins and check format, write/read, timing, seek action and status/control monitors.

Analyzers that work with all Storage Technology Corp. ST506 or ST412 drives cost $14,950. The Data-2000 may be ordered for drives with an enhanced small disk interface at a cost of $15,175.

Wilson Laboratories, 2237 N. Batavia St., Orange, Calif. 92665.

TERMINALS

■ Wyse Technology, Inc. has announced the release of two Ascii terminals that will be sold through distributors and OEMs.

The WY-50+ is an enhanced version of Wyse's WY-50 and is aimed at the full-function terminal market. It features two to four times the display memory of the WY-50 and terminal emulations for the IBM 3101, the Data General Corp. 200 and Televideo Systems, Inc.'s 950 terminals. It also features a bidirectional auxiliary port, enhanced function key capabilities and an amber display. The unit costs $699, and it has an optional four-page memory that costs $30.

The WY-30 is a low-end unit for basic applications such as data entry. The unit features a mechanical switch keyboard, four dedicated function keys, 41 programmable functions, an 80-col. display, a printer port, split-screen capability and a 14-in. flat screen.

The unit is compatible with Lear Siegler Corp.'s ADM 3A/5, Applied Digital Data Systems, Inc.'s Viewpoint terminal and Televideo Systems, Inc.'s 925 and 910+ terminals. It can send data at 38.4K bit/sec. The WY-30 costs $399, and it has an optional tilt-and-swivel base and a height-adjustable arm that cost $20 and $99, respectively.

Wyse Technology, 3571 N. First St., San Jose, Calif. 95134.
